5. In combination with a linotype-machine, a fixed magazine 14 with a series of channels, the underlying ring or plate 27 having a single port, the secondary or intermediate magazine 26 having a series of ports, an underlying plate 20 having a single port, and means for rotating the ring 27 and the magazine 26 intermittently and differentially, substantially as described.

897,012. CONTROLLER FOR ELECTRIC MOTORS. WILLIAM R. FORM, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Aug. 8, 1899. Serial No. 662,061. (No model.)

Claim.—1. In an electric-motor controller of the separately-actuated contact type, a contact for connecting the motors in series, a contact for connecting the motors in parallel, and a mechanical connection between said contacts whereby either one is caused to move to its open position when the other is moved to its closed position.

2. In an electromagnetic system of motor control, the combination with a contact for connecting the motors in series, of a contact for connecting the motors in parallel, a mechanical connection between said contacts whereby either moves to its open position when the other moves to its closed position, and an electromagnet for actuating said contacts.

3. In a system of control for electrical apparatus, the combination with switches thereof of a plurality of separately-actuated electromagnets for operating the switches respectively, means controlled by one of the switches for preventing the closing of another of the switches so long as the magnet of the former is energized, and means for completing the circuit of the magnets for operating the switches.

4. In a system of control for electric motors, the combination of a plurality of separate switches, magnet-coils for actuating the switches, a controller-switch capable of energizing any number of the magnet-coils at the same time, and means controlled by one of the separate switches for preventing simultaneous corresponding operation of another of the switches.

5. In a system of control for electric motors, the combination of a plurality of separate electromagnetically-controlled contacts for changing the resistance of the motor-circuit and also for grouping the motors in series or parallel relation, certain of the contacts being arranged to short one of the motors in changing from series to parallel, electromagnets for controlling the contacts, and means preventing the contacts from short-circuiting the motors when changing from series to parallel even when all of the magnets are simultaneously energized.

6. In a train system of control, the combination of master and motor controllers, comprising a plurality of separately-actuated contacts, certain of the contacts being designed to cut resistance into and out of cir-

cuit, and other contacts for grouping the motors in series or parallel relation by first shorting one motor, then interrupting the circuit of the shorted motor, and establishing a multiple connection with the source of supply, and means controlled by the contact which connects the motors in parallel for opening the contact which connects the motors in series before the parallel connection is made.

7. In a train system of control, the combination of a plurality of motor-cars suited to form a train, four or more motors mounted on each car, the motors being permanently coupled in pairs, a motor-controller for changing the grouping of the pairs of motors from series to parallel relation, the said controller consisting of a plurality of separately-actuated contacts, with electromagnets for actuating the contacts, a motor-controller for energizing one or more of the magnets at will, and means controlled by one of the contacts for interrupting the series connection between the pairs of motors prior to the establishing of the multiple connection.

8. In a circuit-breaker for protecting storage batteries or similar apparatus, the combination of a contact controlling the supply-circuit, a contact for controlling the battery-circuit, and means actuated by one of the contacts for insuring the closing of the other circuit.

9. In a circuit-breaker, the combination of a pair of moving contacts capable of separate and simultaneous movement, a coil for actuating each contact, and a mechanical connection between the contacts so arranged that one contact can open and close without affecting the other.

10. In a circuit-breaker, the combination of a pair of separate contacts, coils for actuating the contacts, and a lever connecting the contacts, which is pivotally secured to one contact, and has a last-motion connection with the other.

11. In a circuit-breaker, the combination of a pair of separate contacts, short-coils for actuating the contacts, cores for the coils which actuate the contacts, a last-motion connection between the cores, and means for insuring the closing of one contact when the other opens.

12. In a system of control, the combination of an electrically-actuated means for opening and closing an electric circuit, a storage battery for actuating said means, and a motor-generator driven by the main source of supply for charging the storage battery.

13. In a system of control, the combination of an electrically-actuated means for opening and closing an electric circuit, a storage battery, a motor-generator for charging the battery, comprising two separate armatures mechanically united, and a coil in circuit with a source of supply for the motor and of the motor-generator for controlling the circuit of the generator.

14. In a system of control, the combination of an electrically-actuated means for opening and closing an electric circuit, a storage battery, a motor-generator for charging the battery, comprising two separate armatures mechanically united, a short and a series field-winding for supplying the field excitation of the motor-armatures, a switch in the circuit of the generator, and a coil in the motor-circuit which controls the switch in the generator-circuit.

15. In a system of control for electric motors, the combination with an electromagnetic switch which normally completes a series circuit and is adapted to be actuated to connect the motors in parallel, of a separate electromagnetic switch adapted to short one motor before the first switch is actuated.

16. In a system of control for electric motors, the combination with a switch for normally connecting the motors in series, of an independently-operated switch for shorting one motor out, and means for electrically operating the first switch to break the series contact and connect the motors in parallel.

17. In an electric switch, the combination with a solenoid, a core thereof, a conducting-piece on said core, a second conducting-piece, a pivoted link to which each conducting-piece is pivoted, and a spring on the second conducting-piece acting against the solenoid.

18. In a system of electromagnetic control for electric motors, the combination with electromagnetic series and parallel switches, of a mechanical connection between said switches adapted to prevent their simultaneous closure.

19. In a system of control, the combination with electrically-operated means for motor control, of a secondary source of current, a motor-generator for charging said source, and a switch between said source and said motor-generator, which is dependent for its operation on the potential of the current supplied to the motor-generator.

20. The combination with transmitting devices, of a main source of electricity, an auxiliary source of electricity, a switch in the circuit of said auxiliary source and normally controlled in its operation by the potential of said main source, and means dependent for its operation on the failure of the main source for maintaining said switch in its closed position.

21. The combination with transmitting devices, of a main source of electricity, an auxiliary source of electricity, means con-

trolled by the potential on the main source for making or breaking a connection between the two sources, and means dependent for its operation on the failure of the main source for breaking the connection between the sources, and connecting the auxiliary source to the translating device.

23. In a system of train control, the combination with an electrically-operated controller, of an auxiliary source of current, a main source of current, a switch in the circuit of said auxiliary source and normally controlled in its operation by the potential of said main source, and means dependent for its operation on the failure of the main source for maintaining said switch in its closed position.

24. In a system of control for electric motors, in combination, an electric controller, electromagnetic means for controlling the operation of the controller-contacts, a main source of current-supply, an auxiliary source for supplying current to said electromagnetic means, electrical connections between said main and said auxiliary sources, and means controlled by the potential of the main source for opening said electrical connections.

25. In a system of control for electric motors, in combination, an electric controller, electromagnetic means for controlling the operation of the controller-contacts, a main source of current-supply connected to supply current to said electromagnetic means, an auxiliary source connected to the main source, and also to said electromagnetic means, and means controlled by the potential of the main source for opening the circuit of said auxiliary source.

26. In a system of control for electric motors, in combination, an electric controller, electromagnetic means for controlling the operation of the controller-contacts, a main source of current-supply connected to supply current to said electromagnetic means, an auxiliary source connected to the main source, and also to said electromagnetic means, means controlled by the potential of the main source for opening the circuit of said auxiliary source, and means operating on the failure of the main source to open the circuit to said source and to close the circuit between the auxiliary source and the electromagnetic means.

27. In a system of electrical distribution, a main source of current-supply, an auxiliary source, translating devices connected to both of said sources, means controlled by the potential of the main source for opening the circuit of the auxiliary source, and means operating upon the failure of the main source to open the main circuit and to close the circuit between the auxiliary source and the translating devices.

28. The combination with means for opening and closing electric circuits, of a battery therefor, a motor-generator for charging said battery, and a circuit-breaker in the armature-circuit of the generator, having its coil in a short-circuit of the motor.

697,018. ELEVATOR RAILWAY. WILLIAM E. FORTY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Dec. 20, 1900. Serial No. 49,468. (No model.)

Claim.—1. In a structure for surface-contact railways, the combination with a conducting-support having an upper depression, of an independent metal disk or stud, which is removably mounted in the depression to make contact with the support.

2. The combination with a conducting-support having upper projecting walls, of a metal stud of smaller diameter than the distance between the walls, which rests between the walls to make contact with the support, and a metal filling between the sides of the stud and the walls of the support, to hold the latter in position.

3. The combination with a conducting-support having upwardly-

projecting walls, of a metal stud of smaller diameter than the distance between the walls, which rests between the walls to make contact with the support, a metal filling between the sides of the stud and the walls of the support, and projections from the stud which engage the walls of the support to protect the metal filling.

4. The combination with a conducting-support having an upper depression, of a metal stud with a smaller diameter than the depression and mounted therein, and a metal filling between the sides of the stud and the walls of the depression, said stud being formed with holes whereby it can be removed from the depression.

5. A stud for surface-contact electric railways, which consists of an independent metal disk provided with lifting-holes.

6. The combination with a conducting-support formed with a depression in its upper surface, of a metal surface-contact disk removably mounted therein, the said disk being provided with lifting-holes.

7. The combination with a conducting-support formed with a depression in its upper surface, of a metal surface-contact disk removably mounted therein, the said disk being provided with lifting-holes, and a metal filling for securing said disk in position.

8. The combination with a conducting-support formed with a shallow depression substantially rectangular in cross-section in its upper surface, of a metal surface-contact disk removably mounted therein, the said disk being provided with lifting-holes, and a metal filling for securing said disk in position.

9. The combination with a conducting-support formed with an upper depression, of a metal stud of smaller diameter than the depression and mounted therein, a metal filling between the stud and the support, said stud being formed with projections which engage the walls of the depression to center the stud therein and to prevent strains on the filling when the stud is subjected to blows, said stud being also formed with holes whereby it can be lifted from the position in which it is held by the metal filling, said holes being formed in said projections whereby the metal filling will not flow into them.

10. A stud for surface-contact electric railways, which consists of an independent metal disk formed with lateral projections, lifting-holes being formed in said projections.

11. The combination with a metal support formed with an upper depression, of a metal stud mounted therein and which has a smaller diameter than that of the depression, and a metal filling between the stud and the walls of the depression, which fills the interstices of the metal parts and secures the stud in position.

12. The combination with a metal support, of a lead extending downwardly therefrom, and a metal surface-stud removably secured to the support by a metal filling.

13. The combination with a vertically-perforated metal support, of a lead extending through the perforation from below and secured to the support from above, and a metal stud removably mounted on the support and covering the end of the lead.

14. In combination, a vertically-perforated metal support having upper and lower shoulders in the walls of the perforation, a metal connection-piece having an upwardly-extending screw-threaded portion, a lead secured to the lower part of the connection-piece, a nut which engages the upper shoulder of the support and also the threaded portion of the connection-piece, to draw the lower part of the connection-piece into good contact with the lower shoulder of the metal support, and a metal stud removably mounted on the upper part of the metal support to make good contact therewith.

15. In a roadway structure for surface-contact railways, the combination with a conducting-support, of an independent disk or stud which is removably mounted within a depression in said conducting-support, and an electrical connection extending downwardly from said support.

16. In a roadway structure, the combination with a conducting member, of insulating material surrounding said member, an electric connection extending to the conducting member through the insulating material, and a metal surface-stud mounted in a depression in said member and having a contacting surface extending above the same.

17. In a roadway structure, the combination with a conducting-support, of insulating material surrounding said support, an independent metal disk or stud which is removably mounted within a depression in said conducting-support, and an electrical connection from the supply system through the insulating material to the support.

18. The combination with a conducting-support, of insulating material surrounding the same, an independent metal disk or stud which is removably mounted within a depression in said conducting-support, a metal casing for the insulating material, and an electrical connection to the support, which extends through the insulating material and metal casing, and is insulated from the latter.

19. The combination with a metal support formed with an upper depression, of a metal disk of less diameter than that of the depression and

mounted therein, metal filling between the walls of the depression and the stud, and projections from the stud which substantially fit the depression and extend in the direction of motion of the car, to prevent the car from loosening the stud.

20. The combination with a metal support formed with an upper depression, of a metal stud of less diameter than that of the depression and mounted therein, metal filling between the walls of the depression and the stud, projections from the stud which substantially fit the depression and extend in the direction of motion of the car, and holes in the projections, by which the stud can be removed from the depression of the support.

21. A stud for surface-contact electric railways, which consists of an independent disk formed with lateral projections.

22. In a roadway structure for surface-contact electric railways, the combination with a suitably-insulated conducting support, means for connecting said support in circuit, and a removable surface-contact stud, the removal of which permits access to said connecting means.

23. In a roadway structure, the combination with a conducting member, of insulating material surrounding said member, an electrical connection extending to the conducting member, and a metal surface-contact disk or stud mounted within a depression in said member and having a central contacting surface extending above the same.

24. In a roadway structure, the combination with a conducting member having an electrical connection secured thereto, of a metal surface-contact disk removably mounted within a depression in said member and having its contacting surface extending above the same.

25. In a roadway structure, the combination with a conducting member having an electrical connection secured thereto, of a metal surface-contact disk removably mounted in a depression in said member and having its upper surface sloping upwardly from the edges of the depression so as to form an upwardly-extending central contacting surface.

26. In a roadway structure, the combination with a conducting member having a shallow depression in its upper surface, of a metal surface-contact disk removably mounted therein, the surface of the said disk sloping upwardly from the edges of the depression.

27. In a roadway structure, the combination with a conducting member having a shallow depression in its upper surface, of a metal surface-contact disk removably mounted therein, and a metal filling for securing said disk to the conducting member.

697,014. FIRE-KINDER AND METHOD OF MAKING. ALFRED F. PUTNAM, Charlton, Mass. Filed Aug. 2, 1901. Serial No. 636,944 (No model.)

Claim.—1. The within-described improvement in the art of making fire-kindlers which consists in thoroughly mixing finely-pulverized resin and coarse resinous sawdust in the proportions of about six ounces of pulverized resin to one hundred and eight cubic inches of coarse resinous sawdust, heating said mixture by the application of dry heat to about 200° Fahrenheit, or sufficiently to cause the resinous matter of the sawdust to appear as an exudation on its outer surface and applying pressure to reduce the mixture to about one-half its original proportions, substantially as described.

2. The within-described fire-kindler composed of finely-pulverized resin and a coarse resinous sawdust in the proportions of about six ounces of resin to about one hundred and eight cubic inches of coarse resinous sawdust, thoroughly mixed together and heated to about 200° Fahrenheit, or until the resinous matter of the sawdust exudes from its surface and the mixture is increased in bulk and applying pressure to reduce the mixture to about one-half its original proportions and form a brick-shaped

block by means of a mold adapted to form transverse depressions across the block, substantially as described.

697,015. AIR-PRESSURE SYSTEM OF LIGHTING. JAMES E. RAFF, Garwin, Iowa, assignor of two-thirds to Harry V. Meyer and Edwin Berry, Garwin, Iowa. Filed Mar. 18, 1901. Serial No. 61,769. (No model.)

Claim.—In an apparatus of the class described, the combination of an air-reservoir, a fuel-tank, a main air-pipe extending directly from the air-reservoir to the fuel-tank, a main supply-pipe extending from the bottom of the fuel-tank, a supplemental pipe extending from the main supply-pipe at a point adjacent to the plane of the bottom of the fuel-tank to the air-reservoir and having an upright portion adapted to contain a portion of the fuel and provided with a valve 16 and with a cock 17 located below the valve and adapted to be open to permit the fuel to rise in the upright portion of the supplemental pipe, said supplemental pipe forming a passage or conduit for the air when the tank is out for refilling, and valves for cutting out the tank, substantially as described.

697,016. STARTING DEVICE FOR ELECTRIC MOTORS. ROBERT H. REAR, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Nov. 20, 1901. Serial No. 62,966. (No model.)

Claim.—1. A starting device for electric motors or other translating devices absorbing heavy starting-currents, comprising an automatic magnetic circuit-breaker designed to cut the motor out of circuit on running overloads, and a switch for closing the motor-circuit through an auxiliary path when first starting the motor.

2. A starting device for an electric motor or other translating device absorbing heavy starting-currents, comprising an automatic magnetic circuit-breaker, a parallel branch around the trip-coil of the circuit-breaker, and a starting-switch adapted to first connect the branch around the trip-coil in circuit with the motor, and finally leave the circuit-breaker only in circuit.

3. A starting device for electric motors or other translating devices absorbing heavy starting-currents, comprising an automatic magnetic circuit-breaker, a protective shunt therefor, and a switch for diverting the current first through the shunt and then through the circuit-breaker.

4. A starting device for electric motors or other translating devices absorbing heavy starting-currents, comprising an automatic magnetic circuit-breaker, a protective shunt therefor, and a switch for diverting the current first through the shunt and then through the circuit-breaker.

cut-breaker, a sheet around the trip-coil, and a starting-switch provided with contacts for coupling the two paths in parallel and then cutting out the by-pass around the trip-coil.

697,017. ADJUSTABLE CONE FOR BEVEL-FLUTE. ALBERT B. RISS, Chicago, Ill., assignor to the Garwood Company, Chicago, Ill., a Corporation of Illinois. Filed Mar. 28, 1901. Serial No. 88,470. (No model.)

Claim.—1. A cone for a ball-bearing having a tapered body portion circular in cross-section and a separate flange-piece *c*, said flange-piece having a disk portion *d*, and a cylindrical flange portion adapted to be fitted upon the tapering body of the cone, substantially as herein set forth.

2. The combination in a ball-bearing, of the hardened-steel adjustable cone having a slightly-tapered body portion and a flange-piece of soft steel having a disk portion *d*, and a cylindrical flange portion adapted to fit upon the tapering body of the cone, substantially as set forth.

697,018. ROVING-BREAKER FOR SPINNING-FRAMES. ALBERT B. RISS, Chicago, Ill., assignor to the Garwood Company, Chicago, Ill., a Corporation of Illinois. Filed July 22, 1901. Serial No. 88,545. (No model.)

Claim.—1. In a spinning-frame, drawing-roll, a clearer-roll, to take up roving from the drawing-roll upon breakage of the thread, and means actuated by or through accumulation of roving upon the clearer-roll to clamp and stop delivery of the roving.

2. In a spinning-frame, drawing-roll, means to clear the front roll of roving upon breakage of the thread, and means to clamp and stop delivery of the roving, said means being controlled and actuated by or through accumulation of roving cleared from the front roll.

3. In a spinning-frame, drawing-roll, means to stop delivery of the roving, said means comprising two apertured and relatively movable members, the apertures normally registering and forming a roving-guide and means, actuated by or through accumulation of roving upon breakage of the thread, to effect relative movement of said apertured members and part the roving.

4. In a spinning-frame, drawing-roll, a clearer-roll cooperating with the front roll, a traverse-bar, means mounted thereon to clamp and stop delivery of the roving to said drawing-roll, said means normally forming a roving-guide, and actuating device for the said means, operated by or through accumulation of roving upon the clearer-roll upon breakage of the thread.

5. In a spinning-frame, drawing-roll, a clearer-roll cooperating with the front roll, a traverse-bar, fixed and movable cooperating members mounted thereon and apertured to normally form a roving-guide, movement of one of said members relatively to the other acting to clamp and stop delivery of the roving, and means, including a rocking actuator moved by accumulation of roving upon the clearer-roll, pivotally connected with and to operate said movable member upon breakage of the thread.

6. In a spinning-frame, drawing-roll, a clearer-roll cooperating therewith, a traverse-bar, a roving-breaker mounted thereon and comprising fixed, and cooperating movable, plates, each having an aperture, the apertures normally registering and forming a roving-guide, and connections between the clearer-roll and the movable plate, said connections including a lever having a fixed fulcrum and adapted to be tipped by accumu-

lation of roving on the clearer-roll, due to breakage of the thread, and a laterally-acting arm pivoted on the lever and connected with the movable plate, to operate it upon tipping of the lever, to thereby move the aperture in the cooperating plate out of register, to clamp and effect breakage of the roving.

697,019. ROTATING-CYLINDER PUMP. ROBERT RICHARDSON, Glasgow, Scotland. Filed Feb. 2, 1902. Serial No. 87,702. (No model.)

Claim.—1. A rotating-cylinder pump consisting of not less than five cylinders disposed radially around a central hollow boss, parts communicating with the bottoms of the cylinders and the center of the boss, a fixed central stand upon which the boss of the cylinder casting or carrier revolves, said central stand having a bearing-surface of about one-fourth of its circumference which as the surfaces wear automatically maintains a fluid-tight joint and thus prevents leakage between the fixed center and the cylinder-boss without the aid of packing, inlet and outlet passages in said fixed central stand for the water or other liquid, parts communicating periodically with the ports in the bottom of the cylinders, pistons in said cylinders and rods connecting the pistons with a disk or disks driven by a shaft concentric to the fixed central stand upon which the cylinder-carrier revolves, substantially as described.

2. In a rotating-cylinder pump having a rotating cylinder-carrier on which five cylinders or a multiple of five cylinders are disposed, and a disk or disks to which the cylinder-pistons are attached rotating concentrically to said cylinder-carrier, a fixed central stand having inlet and outlet passages and ports and a bearing-surface consisting of the bridge-pieces between which the outlet-port is situated, said bearing-surface extending around about one-fourth of the periphery of the central stand, and being placed in such a position relatively to the cylinder-carrier as to be pressed upon by said carrier or its liner during the most effective portion of the piston-stroke whereby leakage between the fixed center and the boss of the cylinder-casting is prevented, substantially as described.

697,020. MEANS FOR HANGING SCREENS. CALVIN ROWLAND, Denver, Colo. Filed July 11, 1901. Serial No. 87,989. (No model.)

Claim.—In an improved pivotal support for window-screens the combination with the window-frame, of a screen-frame provided with a projecting strip adapted to extend between the blind-steps and to the meeting-rail of the upper sash of said window a screw provided with a hook having a resilient end adapted to be sprung to or away from the body of said screw, and secured into the top of said frame at each end and at a distance from each end of said screen-frame that it extends to the inner faces of the oppositely-disposed blind-steps and a nail or pin extended loosely through the loop of said screw and into the inner faces of said blind-steps, and means for securing the said screen-frame against the outer faces of said blind-steps of said window-frame, substantially as described.

697,021. DROP DOOR GONDOLA CAR. RALPH V. SAGE, Johnstown, Pa. Filed Oct. 2, 1891. Serial No. 77,367. (No model.)

Claim.—1. The combination with a car-body, of a center sill comprising two channels back to back or an I-beam of the same section, draft-rigging sills comprising two channels, of a pair of spaced channels secured at their opposite ends to said draft-rigging sills and the inner of said spaced channels also secured to said center sill, a body-bolster secured to the outside of said draft-rigging sills, and top and bottom connection-plates secured to said center and draft-rigging sills and to said bolsters.

2. In a steel gondola car, an improved draft-rigging comprising draft-rigging channels; legs formed of one leg of a channel reinforced and secured to the draft-rigging channels, said legs adapted to take the follower-plates; a channel secured between the draft-rigging channels near the top; and bent plates secured to the bottom of the draft-rigging channels.

3. An improved steel gondola car, comprising a center sill formed of two channels, back to back, or an I-beam of the same section; draft-rigging embodying draft-rigging channels; a pair of channels, secured to the draft-rigging channels and to the center sill; a malleable casting between each pair of channels, adapted to receive the king-pin; and plates secured at the top and bottom of said channels, the draft-rigging channels and center sill.

4. An improved steel gondola car, comprising spaced sills and end doors hinged at one side and provided at the bottom near the other side with a supporting-roller.

5. An improved steel gondola car, comprising side sills formed of channels and extending beyond the ends of the side plates; and sills secured in the ends of the side sills; side plates extending down to the bottom of the outside of the side sills, the sides being apliced at intervals; rolled-steel side stakes, V-shaped in cross-section, secured at intervals to the top of the sides to form the top flange; and doors hinged at one side and provided at the bottom near the other side with a roller, said doors adapted to fold back against the sides of the car and means for fastening the door in a closed position.

6. An improved steel gondola car, comprising center sills formed of two channels, back to back, or an I-beam of the same section; side sills formed of channels and extending beyond the ends of the side plates; and

sills secured in the ends of the side sills; side plates extending down to the bottom of the outside of the side sills, the sides being apliced at intervals; an angle secured along the tops of the sides, to form the top flange; rolled-steel side stakes, V-shaped in cross-section, secured at intervals to the sides as stiffeners; and doors hinged at one side and provided at the bottom near the other side with a roller; a drop-door hinged to the bottom of one of the floor-channels; and means for closing and holding said drop-door closed.

7. An improved steel gondola car, comprising center sills formed of two channels, back to back, or an I-beam of the same section; side sills formed of channels and extending beyond the ends of the side plates; and sills secured in the ends of the side sills; side plates extending down to the bottom of the outside of the side sills and secured thereto; and doors hinged in the ends of the car; drop-doors hinged to the bottom of one of the floor-channels; a shaft; chains secured at one end to the shaft and at the other end to the drop-doors; and draft-rigging embodying channels secured to each other and to the center sills and legs formed of one leg of a channel reinforced, said legs being secured to the channels and adapted to take the follower-plates.

8. An improved steel gondola car, comprising center sills formed of two channels, back to back, or an I-beam of the same section, side sills formed of channels and extending beyond the ends of the side plates; and sills secured in the ends of the side sills; side plates extending down to the bottom of the outside of the side sills and secured thereto; and doors hinged in the ends of the car; drop-doors hinged to the bottom of one of the floor-channels and adapted, when closed, to abut against another; a shaft journaled in the side sills and extending transversely beneath the car; rollers secured to the floor-channel against which the drop-doors abut; malleable cast legs secured to the drop-doors near their free edges; chains secured to such legs and to the shaft and passing over the rollers; and means for operating the same.

9. An improved steel gondola car, comprising center sills formed of two channels, back to back, or an I-beam of the same section; side sills formed of channels and extending beyond the ends of the side plates; and sills secured in the ends of the side sills; side plates extending down to the bottom of the outside of the side sills and secured thereto; and doors hinged in the ends of the car; drop-doors hinged to the bottom of one of the floor-channels and adapted to abut against another; a shaft journaled in the side sills and extending transversely beneath the car; rollers secured to the channel against which the drop-doors abut; malleable cast legs secured to the drop-doors near their free edges; chains secured to said legs and shaft and passing over the rollers; draft-rigging embodying draft-rigging channels, and legs formed of one leg of a channel reinforced and secured to said draft-rigging channels to take the follower-plates; a pair of channels, one secured to the draft-rigging channels and the other to the center sills; a malleable casting between each pair of channels, adapted to form a seat for the king-pin; and top and bottom plates secured to said pair of channels, draft-rigging channels and center sills.

10. In a steel gondola car, the combination with, an improved draft-rigging comprising draft-rigging channels, legs formed of one leg of a channel reinforced and secured to the draft-rigging channels, said legs adapted to take the follower-plates; and a channel secured between the draft-rigging channels near the top, of a bent plate having a rectangular central portion, circular portions adjoining each central portion and side portions bent back and outward to form flanges adapted to be secured to said draft-rigging channels, said bent plate adapted to receive the friction draft-gear.

697,022. CAR-COUPLER. THOMAS J. RANSOM, Corona, N. Y. Filed Sept. 14, 1891. Serial No. 77,401. (No model.)

Claim.—1. Uncoupling mechanism for railroad-cars, comprising a draw-head having coupling provision, a rotatable and longitudinally-movable disk contiguous to the draw-head and having a radial trip-pin, and connections for operating said disk to bring its pin into position and for bodily moving the same to effect the disengagement of the coupling provision.

2. Uncoupling mechanism for railroad-cars, comprising a draw-head having provision for engaging the coupling element of a companion head, a rotatable and longitudinally-movable disk contiguous to the draw-head and having a plurality of peripheral openings, a radial trip-pin interchangeably in one of the same, and connections for operating said disk to bring its pin into position and for bodily moving the same to effect the disengagement of the coupling provision.

3. Uncoupling mechanism for railroad-cars, comprising a draw-head having coupling provision, a rotatable and longitudinally-movable disk having graduations and corresponding perforations, a trip-pin interchangeably in one of the latter, and means including a similarly-graduated indicator for operating said disk to bring its pin into position and for bodily moving said disk to effect the disengagement of the coupling provision.

4. Uncoupling mechanism for railroad-cars, comprising a plurality of pairs of draw-heads each having coupling provision, movable disks, each adjacent to one of the draw-heads and having a trip-pin differentially located relative to the pins of the other disks, and means for operating said disks to cause their pins to independently disengage the coupling provision of the contiguous draw-head.

5. Uncoupling mechanism for railroad-cars, comprising a plurality of pairs of draw-heads each having coupling provision, movable disks each adjacent to one of the draw-heads and having an adjustable trip-pin, and means for operating said disks to cause their pins to independently disengage the coupling provision of the contiguous draw-head.

6. Uncoupling mechanism for railroad-cars, comprising a plurality of draw-heads, each having coupling provision, movable disks each adjacent to one of the draw-heads and having a trip-pin differentially located relative to the pins of the other disks, means for simultaneously operating said disks to cause any one of the same to independently disengage the coupling provision of the contiguous draw-head, and an indicator coacting with said means for determining the particular disengaging disk.

7. Uncoupling mechanism for railroad-cars, comprising a plurality of pairs of draw-heads having coupling provision, a plurality of spring-actuated shafts, rotatable and longitudinally movable and carrying end blocks with pivoted dogs connecting said shafts for unitary actuation, disks on said shafts, each contiguous to one of the draw-heads and having a trip-pin for independently disengaging the coupling provision of the adjacent draw-head and shaft-operating means.

8. Uncoupling mechanism for railroad-cars, comprising a plurality of pairs of draw-heads having coupling provision, a plurality of spring-actuated shafts, rotatable and longitudinally movable and carrying end blocks with pivoted dogs connecting said shafts for unitary actuation, disks on said shafts, each contiguous to one of the draw-heads and having an adjustable trip-pin differentially located relative to the pins of the other disk or disks, and means for operating said shafts to cause one of the trip-pins to disengage the coupling provision of the adjacent head, independent of any engaging action of the other pins.

9. Uncoupling mechanism for railroad cars, comprising a plurality of pairs of draw-heads having coupling provision, a plurality of shafts, rotatable and longitudinally movable and carrying end blocks with pivoted dogs connecting said shafts for unitary actuation, disks on said shafts having graduations and corresponding recesses, a pin interchangeably in one of the recesses of each disk, for disengaging the coupling provision of the adjacent head, and shaft-operating means including an indicator graduated corresponding to the disks.

10. A railroad-car coupling comprising a draw-head provided with a coupling-bar, and pivoted arm located to one side to provide for the entrance of the companion bar, the walls of the totem and said bar and arm being notched in transverse alignment, a normally depressed cross-bar for engaging said notches and the coupling-bar of the companion head, and means for vibrating said arm to raise said cross-bar.

11. A railroad-car coupling comprising a draw-head provided with a coupling-bar and pivoted arm located to one side to provide for the entrance of the companion bar, the bottom of the head being slotted and the arm having a web depending through the same, a normally depressed T-shaped bar having a transverse portion for engaging the coupling-bar of the companion head, and means for contacting with said web for vibrating the arm to raise the T-bar and uncouple.

12. A railroad-car coupling comprising a head having a lower slot flanked with ribs, coupling provision, a movable arm having a web depending in said slot, a disk contiguous to said slot and having a pin, and means for rotating said disk to bring its pin opposite to the slot and for

moving the disk to cause said pin to be guided between the ribs and actuate the arm to effect the uncoupling.

13. Uncoupling mechanism for railroad-cars, comprising a draw-head having coupling provision, a rotatable and longitudinally-movable shaft provided at one end with a block with a pivoted dog for connecting said shaft with other shafts for unitary actuation and at the other end with a sliding sleeve mounted at one end in a suitable bearing and at the other end having a miter-gear, means for rotating said sleeve and shaft, and means on the shaft for disengaging the coupling provision.

14. Uncoupling mechanism for railroad-cars, comprising a plurality of pairs of draw-heads having coupling provision, a plurality of rotatable and longitudinally-movable shafts carrying end blocks with pivoted dogs connecting said shafts for unitary actuation, a sleeve slidably mounted on one of said shafts and provided with a longitudinal slot in which a pin secured on said shaft works and with a miter-gear at one end, means for rotating said sleeve, and means on said shafts for independently disengaging the coupling provision of the draw-heads.

15. Uncoupling mechanism for railroad-cars, comprising a draw-head having a coupling provision, a rotatable and longitudinally-movable shaft carrying an end block with a pivoted dog for connecting said shaft with other shafts for unitary actuation, a sleeve slidably mounted at one end of said shaft and provided with a longitudinal slot in which a pin secured to said shaft works and with a bearing at one end and a miter-gear at the other end, a shaft suitably mounted and provided at one end with a gear meshing with said miter-gear and at the other end with operating means, a pivoted lever having one end bifurcated to engage an annular groove on said shaft, a spring connected with said lever for retracting the same, and means on said shaft for disengaging the coupling provision.

697,028. WINDOW SHADE AND CURTAIN FIXTURE. EDWIN W. SCHNEIDER, Buffalo, N. Y. Filed June 1, 1901. Serial No. 62,708. (No model.)

Claim.—1. In a window-fixture, the combination of a base-plate provided with a slot which opens at one end of the plate and having the portions thereof above and below the slot undercut and raised above the plane of the marginal portions of the plate, a laterally-adjustable bracket provided with a head of T-shaped cross-section having a thick central portion fitted in said slot and reduced upper and lower portions arranged on the rear side of the plate and fitted in the raised undercut portions thereof, and means for holding the bracket in position on the base-plate, substantially as set forth.

2. In a window-fixture, the combination with an arm or bracket having openings, of a pole-holder consisting of a ring or loop and a pair of legs or branches extending rearwardly therefrom and provided with angular rear ends constructed to interlock with said bracket-openings when the legs are parallel with the bracket and capable of withdrawal from the openings when the legs are turned at an angle to the bracket, and attachments arranged on the bracket in front of said openings and constructed to hold said legs against the bracket, substantially as set forth.

3. In a window-fixture, the combination with an arm or bracket having a pair of openings and provided in front of said openings with a pair of hooks, of a pole-holder consisting of a ring or loop and a pair of elastic legs or branches extending rearwardly therefrom, the rear ends of said legs being offset and connected with the legs by angular bends which pass through said bracket-openings, and the body portions of said legs being sprung under the hooks of the bracket, substantially as set forth.

4. In a window-fixture, the combination with a base-plate and an arm or bracket projecting therefrom and having several sets of openings arranged at different distances from the base-plate and provided in front of the series of openings with a pair of hooks, of an adjustable pole-holder consisting of a ring or loop and a pair of elastic legs carrying the same, the rear ends of said legs being offset parallel with the legs and connected therewith by angular bends which pass through a set of said bracket-openings, and the central portions of said legs being sprung under the hooks of the bracket, substantially as set forth.

697,024. CARBID-FEEDING DEVICE FOR ACETYLENE-GAS GENERATORS. WILLIAM R. SOWFORD, Long Island City, N. Y., assignor to the Sunlight Gas Machine Company, New York, N. Y., a Corporation of New Jersey. Filed Jan. 21, 1902. Serial No. 98,572. (No model.)

Claim.—1. In an acetylene-gas generator a carbide-chamber, in combination with two carbide-feeding cups pivoted below the chamber and operatively connected with means for rotating them in such manner that the upper cup, when tilted to its extreme limit, empties a charge of carbide into the lower cup and the latter, when returned, discharges it into the gas-chamber, the first-named cup acting simultaneously to cut off the flow of carbide, substantially as described.

2. In an acetylene-gas generator a carbide-chamber, in combination with two carbide-feeding cups pivoted below the chamber and each provided with means for normally holding its bottom in the path of the flow of the carbide from the chamber; together with means for rotating both cups simultaneously against the influence of the holding means, the arrangement being such that the charge of carbide is emptied into the lower cup when both cups are tilted to one extreme and discharged from the latter under the influence of the first-named means, when both cups are released, substantially as described.

3. In an acetylene-gas generator a carbide-chamber; a gas-generating chamber and two independent carbide-feeding cups pivotally secured below the carbide-chamber and provided with weights for holding the bottoms of the cups normally in the path of the flow of the carbide from its containing-chamber; in combination with means for tilting both cups simultaneously against the influence of the weights until a charge of carbide is deposited into the lower cup and afterward releasing both cups so that the lower cup swings under the influence of its attached weight and discharges the carbide into the gas-chamber, the second cup following after under the influence of its attached weight and acting as a cut-off for the flow of further carbide, until the operation is repeated, substantially as described.

697,025. FOLDING ROCKING-CHAIR. WILLIAM T. CHERRY, Freshwater, Ark. Filed Aug. 21, 1901. Serial No. 72,302. (No model.)

Claim.—1. In a folding chair, the combination with folding legs pivoted to each other, of outwardly-folding sectional supports for the legs, and means carried by the supports for maintaining the parts of the same in proper relative position when the chair is unfolded, substantially as described.

2. In a folding chair, the combination with folding legs pivoted to each other, of outwardly-folding sectional rockers connected to the legs, and means carried by the rockers for maintaining the parts of the same in proper relative position when the chair is unfolded, substantially as described.

3. In a folding chair, the combination with legs pivoted to each other, of outwardly-folding sectional rockers supporting the legs, and means carried by the rockers for maintaining the parts of the same in proper relative position when the chair is unfolded, substantially as described.

4. In a folding chair, the combination with pivotally-connected legs, of outwardly-folding sectional rockers connected thereto, and means carried by the rockers for securing the sections against independent movement, substantially as described.

5. In a folding chair, the combination with pivotally-connected legs, of outwardly-folding rockers composed of pivoted sections connected to the legs, and means carried by said sections for securing the same against independent movement, substantially as described.

6. In a folding chair, the combination with pivotally-connected legs, of outwardly-folding rockers composed of sections pivoted to each other and to the legs, and means carried by said sections for securing the same against independent movement, substantially as described.

7. In a folding chair, the combination with pivotally-connected legs, of outwardly-folding rockers composed of sections pivoted to each other and to the legs, and means carried by the sections for preventing the movement of the same in an inward direction, substantially as described.

8. In a folding chair, the combination with pivotally-connected legs, of rockers connected thereto each composed of sections pivotally connected near their inner ends and stops carried by said sections for limiting the movement of the same in an inward direction, substantially as described.

9. In a folding chair, the combination with pivoted folding legs, of rockers composed of sections pivoted to each other and to the legs, a back connected to the legs, and means for locking the back in an upright position, substantially as described.

10. In a folding chair, the combination with pivotally-connected legs, of rockers secured thereto composed of sections pivotally connected near their inner ends, and a stop-pin on each section adapted to enter a notch in another section, to limit the inward movement only of the sections, substantially as set forth.

11. In a folding chair, the combination of the front and back legs pivoted together between their ends, the rockers secured to the legs and each composed of two sections pivotally connected near their inner ends, a back hinged to the upper ends of the front legs, and means for locking the back in an upright position, substantially as described.

12. In a folding chair, the combination of the pivoted legs, the rockers therefor each composed of two sections pivoted together near their inner ends, and a stop-pin on each section adapted to enter a notch in the other section to limit the inward movement only of the sections, substantially as described.

13. In a folding chair, the combination of the front and back legs pivoted together, the sectional rockers, the arms pivoted to the upper ends of the back legs, the back loosely connected to the upper ends of the front legs, and means for locking the back in an upright position, substantially as described.

14. In a folding chair, the combination with the front and rear legs pivoted together, of a back having a slidable hinge connection with the upper ends of the front legs, pins carried by said arms, and arms on said front legs, adapted to be engaged by said pins, substantially as described.

15. In a folding chair, the combination with pivoted folding front and back legs, of a back connected to the front legs and means for locking the back in an upright position, arms connected at one end to the back legs and means on the front legs for limiting the movement of the arms, substantially as set forth.

16. In a folding chair, the combination of crossed front and back legs pivotally connected to each other, rounds between the parts of the legs, cross-bars also between the parts of the legs forming supports for a seat, arms connected to the back legs, another cross-bar, and means on said cross-bar for limiting the movement of the arms, substantially as described.

17. In a folding chair, the combination with pivoted folding front and back legs, of sectional rockers secured thereto, a back connected to the front legs, and means for locking the back in an upright position, arms

connected at one end to the back legs, and means on the front legs for limiting the movement of the arms, substantially as set forth.

16. In a folding chair, the combination with pivoted folding front and back legs, of sectional folding resters connected to the legs, arms connected to move with one set of legs, a back connected to the other set of legs, and means for locking the back in an upright position, substantially as described.

697,026. ROTARY ENGINE. JAMES P. SHEPARD, Farmersburg, W. Va. Filed May 16, 1901. Serial No. 60,512. (No model.)

Claim.—1. The combination in a rotary engine, of a cylinder, a steam-chest, an inlet-port opening into the cylinder, steam-passages extending from the steam-chest to said port at opposite sides thereof, a vertically-movable abutment and valve disposed for movement through said port and adapted to entirely close the same when in alignment with the bore of the cylinder, said abutment having a narrow vertically-guided body portion separating the two steam-passages from each other and guiding the steam from one passage to one side of the cylinder and from the opposite passage to the opposite side of the cylinder, there being at the bottom of said abutment a foot portion widened at each side of the body portion for the action of steam leading from either passage, said abutment being operated in a downward direction by the pressure of steam against its foot and being operated in an upward direction by contact with the rotating piston, and a valve located in the steam-chest for controlling the flow of steam through one or either of passages, substantially as specified.

2. The combination in a rotary steam-engine, of a cylinder having convex heads, a steam-chest, a piston in said cylinder said piston having annular end portions provided with annular packings of a diameter equal to the bore of the cylinder and adapted for constant contact therewith and a central cross-sectionally elliptical portion, a steam-port opening into the central portion of the cylinder said port being of a length equal to the distance between the adjacent faces of the annular portions of the piston, an abutment disposed for vertical movement through the port into and out of the cylinder and in contact with the elliptical portion only of the piston, said abutment having a constricted body portion and a foot portion widened at each side of the body portion and adapted to be operated in a downward direction by the steam-pressure, steam-passages connecting the steam-chest with the port at opposite sides of the abutment, and a valve in said chest for opening and closing the passages interchangeably, substantially as specified.

3. The combination in a rotary engine, of a steam-cylinder, steam-chest and connecting-passages, a shell or casing containing and forming the same, said shell or casing comprising two similarly-shaped vertically-connected sections 5, 6, a central web 17 having abutment-chamber formed partly in each of said sections, a rotary piston having annular end portions fitting closely in the cylinder and provided with annular packing for preventing the escape of steam laterally, and a central portion of elliptical shape in cross-section, an entrance-port 18 of a width equal to that of the elliptical portion of the piston, said port forming the common outlet of steam-passages 15 and 16 leading from the steam-chest, and an abutment having a narrowed plate or web 20, adapted to the abutment-chamber, and having its foot portion laterally extended on each side of the web for operation by steam entering from either side of said abutment, substantially as specified.

697,027. DRUM OR BARREL HEAD. JOHN L. SHEPARD, Charleston, S. C. Filed Oct. 2, 1901. Serial No. 77,575. (No model.)

Claim.—1. The combination with a drum or barrel head, having an opening, the wall of said opening counterbored to form an annular shoulder,

of a disk closing said opening and seated on said annular shoulder, the upper face of said disk aligning with the upper face of the head, removable fastening devices for securing the disk to the head, and a frangible sheet covering said disk and secured to the upper face of the head.

2. The combination with a drum or barrel head having an opening therein, and a flange around said opening flush with the inner face of the head, of a disk supported on said flange flush with the outer face of the head, an enlargement or extension on the disk fitting said opening and flush with the inner face of the head, legs on said extension projecting beyond the same and adapted to be moved into alignment with notches in the flange, and a bar on the outer face of the disk adapted to project over and be secured to, the head.

3. The combination with a drum or barrel head having an opening therein and a flange around said opening, said flange counterbored to form an annular shoulder, of a disk or closure adapted to fit into said opening and rest upon said annular shoulder, means for removably securing the disk in said opening, and a frangible sheet glued to the disk, overlapping the head and secured upon the latter, said frangible sheet also covering the removable securing means.

697,028. REEF-CULTIVATOR. JOHN W. SHELLER, Greensburg, Ind. Filed Sept. 12, 1901. Serial No. 73,512. (No model.)

Claim.—1. In a reef-cultivator, the combination with a shaft, traction-wheels on either end thereof, a plurality of intermediate wheels, projections carried by said wheels, a knife pivoted to each projection, a spring for projecting the knife laterally from the wheel, and means for retracting it.

2. In a reef-cultivator, the combination with a shaft, traction-wheels on either end thereof, a plurality of intermediate wheels, projections carried by said wheels, a knife pivoted to each projection, a spring for projecting the knife laterally from the wheel, and a cam-rib on the shaft for retracting the knives toward the wheel and out of engagement with the reef.

3. In a reef-cultivator, the combination with a frame, traction-wheels carried thereby, a shaft laterally disposed on said frame, a plurality of parallel wheels arranged on said shaft, a plurality of concentrically-arranged bifurcated projections carried by each wheel, a lever pivoted between each projection, a knife carried by each lever and arranged opposite the periphery of the wheel, the free ends of said levers being positioned near the shaft, a spring between the projections and shaft for projecting the knives laterally away from the wheel, and a cam-rib on the shaft for retracting the knives toward the wheel.

4. In a reef-cultivator, the combination with a shaft having traction-wheels thereon; of intermediate wheels on said shaft, and pivot-knives upon each intermediate wheel, said knives being adapted to be projected and retracted laterally in relation to their wheel.

5. In a reef-cultivator, the combination with a shaft and traction-wheels carried thereby; of intermediate wheels on said shaft, knives pivoted on said intermediate wheels and means for independently and consecutively projecting and retracting said knives laterally in relation to their wheels.

6. In a reef-cultivator, the combination with a shaft; of a wheel thereon, retractible knives pivoted to the sides of, and carried by, said wheel, and means for projecting the knives laterally from the wheel.

7. In a reef-cultivator, the combination with a shaft having traction-wheels thereon; of intermediate wheels on said shaft, a plurality of concentrically-arranged knives pivoted on the intermediate wheels, means on the shaft for retracting the knives toward their wheels, and means for consecutively and independently projecting the knives laterally from their wheels.

8. In a reef-cultivator, the combination with a non-rotatable shaft; of a wheel loosely mounted thereon and adapted to receive motion through

contact with the ground, pivoted knives carried by said wheel, resilient controlling means for projecting the knives laterally away from the wheel and a cam upon the shaft for retracting the knives.

9. In a beet-cultivator, the combination with a shaft; of a plurality of pivoted rotating knives arranged concentrically with relation to the shaft, means for successively and independently projecting the knives at right angles to the direction of travel of the cultivator, and means for retracting said knives during the rotation thereof.

10. In a beet-cultivator, the combination with a frame; of a crank-shaped axle thereon having traction-wheels at the ends thereof, intermediate wheels upon said axle adapted to be lowered into contact with the ground, a plurality of pivoted knives secured to the side of each intermediate wheel, resilient controlling means for projecting the knives laterally from the wheel, and fixed cams upon the axle for retracting said knives.

697,039. REFRIGERATING SYSTEM. WILLIAM F. SHERR, New York, N. Y., assignor to the Singer Automatic Ice Machine Co., Jersey City, N. J., Filed Nov. 16, 1900. Serial No. 24,614. (No model.)

Claim.—1. In a refrigerating system and in combination, a gas-compressor, a circulatory pipe system leading into said compressor, means for removing the heat of compression, an expansion-valve in said pipe system whereby expansion of the contained fluid is permitted and the portion of said pipe system beyond said valve converted into a refrigerating coil or chamber and means interposed between said compressor and said expansion-valve and connected with and operated by the reduced pressure in said refrigerating-coil for regulating the flow of fluid through said system, substantially as described.

2. In a refrigerating system and in combination, a gas-compressor, a circulatory pipe system leading into said compressor, means for removing the heat of compression, an expansion-valve in said pipe system whereby expansion of the contained fluid is permitted and the portion of said pipe system beyond said valve converted into a refrigerating coil or chamber, a fluid-controlling valve in said pipe system between said compressor and said expansion-valve and a tube connecting said refrigerating-coil with said fluid-controlling-valve whereby the flow of fluid through said system is automatically regulated by variations of pressure in said refrigerating-coil, substantially as described.

3. In a refrigerating system and in combination, a gas-compressor, a circulatory pipe system leading into said compressor, means for removing the heat of compression, an expansion-valve in said pipe system whereby expansion of the contained fluid is permitted and the portion of said pipe system beyond said valve converted into a refrigerating coil or chamber, a fluid-controlling valve in said pipe system between said compressor and said expansion-valve, a diaphragm operating said fluid-controlling valve and a tube connecting said refrigerating-coil with the diaphragm-chamber of said fluid-controlling valve whereby the flow of fluid through said system is automatically regulated by variations of pressure in said refrigerating-coil acting upon said diaphragm, substantially as described.

4. In a refrigerating system and in combination, a gas-compressor,

a cooling-jacket surrounding said compressor, a circulatory pipe system leading into said compressor, an expansion-valve in said pipe system whereby expansion of the contained fluid is permitted and the portion of said pipe system beyond said valve converted into a refrigerating coil or chamber and means automatically operated by variations of pressure in said refrigerating-coil for regulating the supply of water to said cooling-jacket, substantially as described.

5. In a refrigerating system and in combination a gas-compressor, a cooling-jacket surrounding said compressor, a condenser, a pipe leading from said cooling-jacket to said condenser, a circulatory pipe system leading into said compressor, an expansion valve in said pipe system whereby expansion of the contained fluid is permitted and the portion of said pipe system beyond said valve converted into a refrigerating coil or chamber and means automatically operated by variations of pressure in said refrigerating-coil for regulating the supply of water to said cooling-jacket and condenser, substantially as described.

6. In a refrigerating system and in combination, a gas-compressor, a cooling-jacket surrounding said compressor, a circulatory pipe system leading into said compressor, an expansion-valve in said pipe system whereby expansion of the contained fluid is permitted and the portion of said pipe system beyond said valve converted into a refrigerating coil or chamber, a feed-pipe leading to said cooling-jacket, an automatic valve in said feed-pipe and a tube connecting said refrigerating-coil with said valve whereby the supply of water to said cooling-jacket is automatically regulated by variations of pressure in said refrigerating-coil, substantially as described.

7. In a refrigerating system and in combination, a gas-compressor, a cooling-jacket surrounding said compressor, a condenser, a pipe leading from said cooling-jacket to said condenser, a circulatory pipe system leading into said compressor, an expansion-valve in said system whereby expansion of the contained fluid is permitted and the portion of said pipe system beyond said valve converted into a refrigerating coil or chamber, a feed-pipe leading to said cooling-jacket, an automatic valve in said feed-pipe and a tube connecting said refrigerating-coil with said valve whereby the supply of water to said cooling-jacket and condenser is automatically regulated by variations of pressure in said refrigerating-coil, substantially as described.

8. In a refrigerating system and in combination, a gas-compressor, a circulatory pipe system leading into said compressor, a cooling-jacket surrounding said compressor, an expansion-valve in said pipe system whereby expansion of the contained fluid is permitted and the portion of said pipe system beyond said valve is converted into a refrigerating coil or chamber, means interposed between said compressor and said expansion-valve for automatically regulating the flow of fluid through said system and means for automatically regulating the flow of water for cooling and condensing the refrigerating-gas, both said means being connected with and operated by variations of pressure in said refrigerating-coil, substantially as described.

9. In a refrigerating system and in combination, a gas-compressor, a circulatory pipe system leading into said compressor, a cooling-jacket surrounding said compressor, an expansion-valve in said pipe system whereby expansion of the contained fluid is permitted and the portion of said pipe system beyond said valve is converted into a refrigerating coil or chamber, an automatic valve interposed between said compressor and said expansion-valve for regulating the flow of fluid through said system and an automatic valve for regulating the flow of water for cooling and condensing the refrigerating-gas, both said valves being connected with and operated by variations of pressure in said refrigerating-coil, substantially as described.

10. In refrigerating apparatus the combination with a compartment of an expansion-chamber within said compartment, valve mechanism for controlling the entrance of fluid to said expansion-chamber, an exhaust-pipe leading from the expansion-chamber, a pump connected to said exhaust-pipe, a regulator also connected to said exhaust-pipe, a condenser, a tank in which said condenser is located, means for supplying water to said tank, a valve in the water-supply means and device controlled by the regulator for actuating said valve.

11. A refrigerating system comprising a gas-compressor, an expansion coil or chamber, a pipe adapted to convey refrigerating fluid to said expansion-coil, a pipe adapted to convey water to cool and condense the gas, valves in each of said pipes and an integral means acting simultaneously and equally upon said valves whereby the flow of refrigerating-gas and the flow of water may be stopped and started automatically and at substantially the same time.

12. A refrigerating system comprising a gas-compressor, an expansion coil or chamber, a pipe adapted to convey refrigerating fluid to said expansion-coil, a pipe adapted to convey water to cool and condense the gas, diaphragm-valves in each of said pipes the diaphragm-chambers of said valves being connected to the same portion of a pipe system and means acting simultaneously upon said valves through said pipe system

whereby the flow of refrigerating-gas and the flow of water may be stopped and started automatically and at substantially the same time.

13. A refrigerating system comprising a gas-compressor, an expansion coil or chamber, a pipe adapted to convey refrigerating fluid to said expansion-coil, a pipe adapted to convey water to cool and condense the gas, valves in each of said pipes operatively connected to a single fluid-container so as to be equally subject to variations of pressure therein and thermostatically-controlled means for varying the pressure in said container whereby the flow of refrigerating-gas and the flow of water may be stopped and started automatically and at substantially the same time.

14. A refrigerating system comprising a gas-compressor, an expansion coil or chamber, a pipe adapted to convey refrigerating fluid to said expansion-coil, a pipe adapted to convey water to cool and condense the gas, valves in each of said pipes and connected with said expansion-coil whereby a variation of pressure in said coil caused by the starting or stopping of said compressor acts to open or close said valves at substantially the same time.

15. A refrigerating system comprising a gas-compressor, a compartment, an expansion coil or chamber in said compartment, means operated by a thermostat in said compartment for starting and stopping said compressor, a pipe adapted to convey refrigerating fluid to said expansion-coil, a pipe adapted to convey water to cool and condense the gas, valves in each of said pipes and connected with said expansion-coil whereby a variation of pressure in said coil caused by the starting or stopping of said compressor acts to open or close said valves at substantially the same time.

697,080. COMBINATION GAS AND OIL BURNER. GEORGE A. SMITH, Indianapolis, Ind. Filed Mar. 22, 1901. Serial No. 32,461. (No model.)

Claim.—1. In a combination gas and oil burner, a plate, a distributing-chamber under said plate having a groove or indent in its outer wall near the plate, extending into the side of the top of the distributing-chamber, the walls of said chamber having a plurality of holes leading from the chamber into the groove or indent and said plate having a slot over the holes, a pipe supplying gas to the chamber, a deflector supported above the slotted plate, an oil cup or cups on the plate adjacent to the slot therein, said plate also having a flange extending upwardly along its rear edge to direct the heat and products of combustion and means for supplying volatilized hydrocarbon to said cup.

2. In a combination gas and oil burner, a plate, a distributing-chamber under said plate having an outside groove or indent adjacent to the plate, extending into the side of the top of the distributing-chamber, the walls of said chamber having a plurality of holes leading from the chamber into the groove, said plate having a slot immediately over the holes, a pipe supplying gas to the chamber, a deflector supported above the slotted plate, an oil cup or cups on the plate adjacent to the slot therein, said plate also having a flange along upper rear edge, a distributing and volatilizing chamber under the cups having communication therewith through suitable openings and a pipe supplying oil to said volatilizing-chamber.

697,081. FENCE-POST. CHARLES W. SUGG, Clarksville, Ohio. Filed Oct. 2, 1901. Serial No. 77,491. (No model.)

Claim.—A tubular post having oppositely-disposed lateral openings near its lower end and having inner guide-grooves leading from the top to the upper ends, only, of the said lateral openings, a driving-point detachably fitted to the lower end of the post, a rod insertible within the post and having a slot near its lower end, anchoring-spurs located within the said slot and having their upper ends overlapped and pivoted together and to the rod by the same pivot-fastening, the upper ends of the spurs

being made rounding to obtain a bearing against the upper end of the slot, and the points of the spurs normally projecting beyond the sides of the rod to enter and travel in the aforesaid guide-grooves and limited in their inward movement by a portion of the rod at the lower end of the slot, and a cap for closing the upper end of the post and the upper ends of the said guide-grooves, substantially as described.

697,082. TRUSS. THOMAS C. SPILLER, San Francisco, Cal. Filed Jan. 20, 1902. Serial No. 31,306. (No model.)

Claim.—A truss having a spring-metal band extending around the body and pressing against the back and front of the body to hold said band in position, a short strap flexible, joined at one end to one end of the band and at the other end carrying a pad for pressing against the body at the point desired and a strap connected to the other end of the band and also to the pad, substantially as described.

697,088. VEHICLE-TIRE. CHARLES STEEL, Readville, Pa., assignor to the Steel Double Cushion Tire Co., Akron, Ohio, a Corporation of New Jersey. Filed Oct. 25, 1900. Renewed Sept. 10, 1901. Serial No. 74,399. (No model.)

Claim.—1. In a vehicle-tire, the combination of a rim having a channeled portion, and a tire having only a main body portion which has a gradual taper upwardly, and which has its outer lower corners shaped so as to normally leave a space between said lower surfaces and the lower inner surface of the rim, said tire being also formed with a lower arched portion which extends into its main body portion, and a cushioning-aperture above the lower arched portion, and intermediate its tread and under side, whereby cushioning effects are secured between the tread and the intermediate cushion, and the lower arched cushion and the lower apertured corner-cushion, and between the intermediate cushion and the arched cushion, and the apertured corner-cushion, substantially as described.

2. In a vehicle-tire, the combination of a rim having a channelled portion, and a tire having a main body portion only which has a gradual taper upwardly, the said body portion being substantially triangular in vertical cross-section with rounded corners, the lower surface of said tire being shaped so as to normally leave cushioning-spaces between said lower surface and the lower inner surface of the rim, said tire being also formed with a lower arched portion extending into the triangular-shaped body portion, and with apertures for connecting-wires, substantially as described.

3. In a vehicle-tire, the combination of a rim having a channelled portion and a tire having its outer lower corners curved so as to normally leave a space between said curved portions and the inner lower surface of the rim, said tire being also corrugated on its under surface to form a series of cushions, and provided with a cushion intermediate its tread and its under side, whereby cushioning effects are secured between the tread and the intermediate cushion, and between the intermediate cushion and the corner-cushion, and the under cushions, substantially as described.

4. In a vehicle-tire, the combination of a rim having a channelled portion and a tire having only a main, cold body portion which has a gradual taper upwardly, and which has its outer lower corners shaped so as to normally leave spaces between said lower surface and the lower inner surface of the rim, said tire being also formed with a plurality of arched portions which extend into the main body portion thereof, substantially as described.

5. In a vehicle-tire, the combination of a rim having a channelled portion and a tire having a cold main body portion only, and which has a gradual taper upwardly, the entire body portion being substantially triangular in vertical cross-section, the said tire being formed with a lower arched cushion extending into the triangular-shaped body portion and with a central cushion, and with apertures for connecting-wires, the construction and arrangement being such that cushioning effects are secured between the tread of the tire and the central cushion, and the lower arched cushion, substantially as described.

897,084. STOVEPIPE-COLLAR. JAMES SCHMIDLER, Dubuque, Ia. Filed Oct. 20, 1901. Serial No. 20,447. (No model.)

Claim.—1. The combination with a stovepipe-collar, of a spring retaining device applied to the inner surface of the collar proper, said retaining device being in the form of a spring-strip the end portions of which are bent to provide flaring arms with unconfined extremities which engage the chimney-flue and oppositely-located and inwardly-projecting elbows, which clamp the pipe, substantially as and for the purpose described.

2. The combination with a stovepipe-collar, of a combined collar-retaining and stovepipe-clamping device, the same consisting of a spring-strip the body portion of which is bent in the form of a bow and secured throughout a portion of its length to the collar, the end portions of the strip being left free and bent to form elbows which project within the edge of the opening in the collar for engaging the stovepipe, and divergent arms adapted to bear against the flue at opposite points for retaining the collar in position.

3. The combination with a stovepipe-collar, of a combined collar-retaining and stovepipe-clamping device consisting of a strip of spring material secured to the inner surface of the collar and having its end portions bent to form spring retaining arms and elbows which project partially within the edge of the opening in the collar, the said elbows being flattened to form bling edges adapted to impinge against the stovepipe at opposite points.

897,085. SYSTEM OF ELECTRIC DISTRIBUTION. CHARLES F. SCHMIDLER, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Aug. 18, 1901. Serial No. 72,470. (No model.)

Claim.—1. The combination of direct-current mains, and a plurality of separate neutral conductors, each constituting with said mains a multiple-wire direct-current system of distribution.

2. The combination of direct-current mains, a plurality of neutral conductors, means for maintaining said conductors at a potential intermediate between that of said mains, and transmitting devices connected between said neutral conductors and said mains.

3. The combination of a dynamo-electric machine having a winding provided with a commutator, conductors connected to brushes on said commutator, means for deriving a plurality of points each having a potential neutral with respect to said winding, and conductors extending from said points.

4. The combination of a winding provided with a commutator, a plurality of compensators connected in multiple to each other and to points in said winding, and conductors leading from points in the windings of said compensators.

5. The combination of a winding provided with a commutator, means for deriving separate points each of neutral potential with respect to said winding, and conductors extending respectively from said points.

6. The combination of a winding provided with a commutator, windings connected with the first-mentioned winding and carrying alternating currents, and conductors adapted to carry direct current extending respectively from points in the last-mentioned windings.

897,086. BOTTLE-STOPPER. ARTHUR BRUNN, New York, N. Y. Filed Sept. 4, 1901. Serial No. 74,801. (No model.)

Claim.—1. A bottle-stopper consisting of an integral structure adapted to be forced into the neck of the bottle, comprising a plurality of concentric rings or bands united by internal flanges at alternate edges, the outer ring or band inclosing or surrounding the others.

2. A bottle-stopper consisting of an integral structure comprising a ring or band turned inward and downward at one edge to form a second ring or band which is half turned inward and upward at its opposite edge to form a third ring or band closed at its opposite edge, the structure being adapted to be forced into the neck of a bottle.

897,087. FOLDING CHICKEN-COOP. FRANK E. SCHMIDLER, St. Louis, Mo. Filed July 27, 1901. Serial No. 69,900. (No model.)

Claim.—1. The combination with the bottom, of the side and end sections hinged to said bottom, the cover-sections being hinged to the side sections, said cover-sections having depending staples arranged opposite each other, an arm pivoted to the bottom and carrying a strip at its outer end, said strip carrying bolts adapted to engage said staples for the purpose of locking the cover-sections together, substantially as shown and described.

2. The combination with the cover-section, having staples arranged at their opposing edges, said staples being adapted to register when the cover-sections are closed, an arm adapted to be pivoted to the bottom, the strip pivotally connected to the upper end of said arm, and the belt carried by the said strip and adapted for engagement with the staples, substantially as herein shown and described.

697,088. CAN TOP AND CAP. JAMES B. SHAW, Ohio, Cal. Filed June 28, 1901. Serial No. 69,978. (No model.)

Claim.—1. A can-top comprising a central opening surrounded by a depressed grooved or creased wall which occupies the lowest level of the under side of the top and has its inner edge upwardly bent, and a horizontal shoulder above the plane of said wall and completely surrounding the latter, and a cap having a horizontal peripheral flange to engage said shoulder and to be wholly disposed above the said depressed grooved or creased wall.

2. A can-top having a central opening therein with a depressed wall therearound forming the lowest portion of the top, the inner edge of the said depressed wall being struck upwardly, the top also having a horizontal shoulder extending completely around the same above the plane of the said wall, and a cap having an edge portion to bear upon the said shoulder.

3. A can-top comprising a central opening surrounded by a depressed grooved or creased wall which occupies the lowest level of the under side of the top and has its inner edge upwardly bent, and a horizontal shoulder above the plane of said wall and completely surrounding the latter, the said top also being formed with an upstanding bead located at the outer portion of said shoulder to prevent the latter from running over onto the top, beyond the said bead, and a cap having a horizontal peripheral flange to engage said shoulder and be disposed wholly above the plane of the depressed grooved or creased wall around the opening in the top.

697,089. HORSE-KITCHING DEVICE. ARTHUR W. SWANSON, Rockford, Ill. Filed May 4, 1901. Serial No. 64,707. (No model.)

Claim.—1. A horse-kitching device comprising two jaws pivoted together, a yoke pivoted to each jaw, a wheel supported by each yoke, a strap having its ends connected to the jaws, the end of the strap connected to one jaw passing around the wheel supported by the opposite jaw.

2. A horse-kitching device comprising two jaws pivoted to a plate, the plate having two holes, a swinging yoke supported by each jaw, a roller supported by each yoke, a strap having its ends connected with the jaws, the end of the strap connected with one jaw passing around the wheel supported by the opposite jaw, the strap passing through the holes in the plate.

697,040. JOURNAL-BOX. THOMAS H. STERNBERG, Wilmington, N. C. Filed Mar. 4, 1901. Serial No. 69,964. (No model.)

Claim.—1. The combination with a journal-box of a lid loosely pivoted at one end thereof, a belt pivoted in the box, and a spring rigidly secured by one end to the end of the belt and bearing at its free end upon the lid to press it upon its seat on the box, the lid, spring, and belt turning together when the lid is opened.

2. The combination with a journal-box of a lid loosely pivoted at one end thereof, a belt pivoted in the box, and a spring rigidly secured by one end to the end of the belt and bearing at its free end upon the lid to press it upon its seat on the box, the weight of the lid being supported by projections on the box and independently of the belt, the lid, spring, and belt turning together when the lid is opened.

3. The combination with a journal-box of a belt pivoted in the box, a spring secured at one end to the end of the belt, and a lid hinged between the spring and the box and pivoted about the same center as the spring, the spring having but one free end which bears upon the center of the lid to press it upon its seat upon the box, the lid, belt and spring being arranged to turn together and about the same center when the lid is opened.

4. The combination in a journal-box of a lid supported at two points one on each side of the opening in the box, and said lid pivoted at one side of the box, a belt pivoted in a lug on the same side of the box, and a spring rigidly secured to the end of the belt beyond the outer surface of the lid and bearing at its free end upon the lid to press it upon its seat on the box, the lid, belt and spring turning together when the lid is opened.

5. The combination with a journal-box of a lid the weight of which is supported at two points one on each side of the opening in the box, a belt pivoted in a lug on the side of the box, and a spring rigidly secured by one end to the end of the belt beyond the outer surface of the lid and bearing at its free end upon the lid to press it upon its seat on the box, the said lid being free to turn with the spring about the same center, and lateral displacement of the lid being prevented by the pivot of the spring.

6. The combination with a journal-box of a belt pivoted at one side of the opening in the box thereof, a spring rigidly secured by one end to the end of the belt, a lid bearing upon a seat surrounding the opening in the box and arranged to turn with the spring about the same center, the free end of the said spring bearing upon the center of the lid to press it upon its seat on the box and being connected with the lid that when the lid is opened the lid and spring will turn together.

7. The combination with a journal-box of a lid loosely pivoted at one end thereof, a belt pivoted in the box, and a spring rigidly secured by one end to the end of the belt and bearing at its free end upon the lid to press it upon its seat on the box, the said free end of the spring being connected with the lid that when the lid is opened the lid and spring will turn together.

8. The combination with a journal-box of a belt pivoted at one side of the opening in the box thereof, a spring rigidly secured by one end to the end of the belt beyond the plane of the face of the box, a lid bearing upon a seat surrounding the opening in the box and arranged to turn with the spring about the same center, the free end of the said spring bearing upon the center of the lid to press it upon its seat on the box and being connected with the lid that when the lid is opened the lid and spring will turn together, and the box being provided with an extension-seat to support the lid when it is open.

9. The combination in a journal-box of a lid thereof, and an independent U-shaped spring, having both legs turned in the same direction, one leg being longer than the other, the short leg attached to the box, and the free leg turned over the point of support of the attached leg, and bearing on the lid only at or about its center.

10. In a journal-box, the combination of a box having an opening on one side provided with a seat for a lid all around the opening, a lid pivoted to the box and supported by the box in a plane parallel with the plane of the seat on one side of its pivot only, that is to say, by the seat, the lid being opened by revolving around the pivot in or about the same plane as the seat, and a U-shaped spring having a short and a long leg supported by the box by its short leg only, having both legs turned in the same direction and having the long leg turned over the point of support, or attachment, of the short leg and resting upon the lid, at or about its center only, substantially as described.

11. The combination with a journal-box having an opening on one side, with a seat all around the opening, of a lid pivoted to the box on a

pivot perpendicular to the plane of the seat, said lid having a bearing on the seat and supported on the box in the plane of the seat, on the one side of the pivot only.

697,041. VARIABLE-MOTION MECHANISM. ALBERT E. TUBBS, Everett, Mass. Filed May 24, 1901. Serial No. 61,789. (No model.)

Claim.—1. A rotatable shaft, a pulley loosely mounted on the shaft but adapted to be connected to rotate therewith, a pinion secured to the shaft, a pinion loosely mounted on the shaft, means for preventing backward movement of the last-mentioned pinion, a plate loosely mounted on the shaft, a pinion mounted on said plate and in mesh with the pinion hereinbefore described, and a gear borne by the pulley and in mesh with the pinion on the plate.

2. A rotatable shaft, a pulley loosely mounted on the shaft but adapted to be connected to rotate therewith, a ratchet loosely mounted on the shaft, a pawl adapted to engage the ratchet, a pinion rigidly connected with the ratchet, a pinion secured to the shaft, a plate loosely mounted on the shaft, a pinion mounted on the plate and in engagement with the pinion hereinbefore mentioned, and a gear on the pulley adapted to engage the pinion on the plate.

3. A rotatable shaft, a pulley loosely mounted on the shaft but adapted to be connected to rotate therewith, said pulley having an internal gear, a ratchet loosely mounted on the shaft, a pawl to engage the ratchet, a pinion rigidly connected with the ratchet, a pinion secured to the shaft, said pinion having a different number of teeth, a plate loosely mounted on the shaft, and a pinion mounted on the plate and in mesh with said internal gear, and also with the pinion hereinbefore mentioned.

4. In a fast and slow motion mechanism, in combination, a rotatable shaft, a pulley loosely mounted on the shaft, a clutch-section splined to the shaft and adapted to be engaged with the pulley, a pinion loosely mounted on the shaft, means for preventing backward movement of said pinion, a pinion secured to the shaft, a plate loosely mounted on the shaft, a pinion in engagement with said pinion hereinbefore mentioned, and a gear on the pulley in engagement with the pinion on the plate.

697,042. CHEMOTHERAPY OF CHLORINE ALKALOIDS. RUDOLF TILKE, Frankfurt-on-the-Main, Germany, assignor to Vereinigte Chemische Werke AG, Frankfurt-on-the-Main, Germany. Original application filed Apr. 24, 1901. Serial No. 67,382. Divided and this application filed Feb. 12, 1902. Serial No. 59,784. (No specimens.)

Claim.—1. The herein-described new chlorine-alkaloid ether of the chlorine alkaloids, being difficultly soluble in water, readily soluble in alcohol, benzene, and ether, possessing basic properties and forming with inorganic and organic acids well-characterized salts, substantially as hereinbefore described.

2. The herein-described new chlorine-alkaloid ether of quinine, having most probably the formula:

being a tasteless white powder melting at 111° centigrade easily soluble in alcohol, ether and benzene, and difficultly soluble in water and glycerin, and forming well-characterized salts with inorganic and organic acids, substantially as described.

697,043. SEWED SIGNATURE. WILFRED C. TAYLOR, Chicago, Ill. assignor, by direct and mesne assignments, to Trovatin Machine Company, Chicago, Ill., a Corporation of Illinois. Filed May 24, 1900. Serial No. 17,577. (No model.)

Claim.—1. A book comprising a plurality of signatures connected at the back thereof by two threads and two lines of stitching, said threads being knotted together at one point between each pair of signatures, and alternately on each line of stitching, substantially as described.

2. A plurality of signatures attached together at their back edges by a plurality of threads on a plurality of lines of stitching, said threads being knotted together alternately on each line of stitching, the knots be-

tween each pair of signatures being arranged so as to effect the knots between the next adjoining pair of signatures, substantially as described.

3. A plurality of signatures sewed together by alternating knotted and unknotted stitches, the knots connecting each pair of signatures being so located as to effect knots connecting the next adjoining pair of signatures, substantially as described.

4. A series of signatures sewed together by a stitching comprising a plurality of threads knotted together between every alternate pair of signatures and along one line of stitching and knotted together between intervening pairs of signatures on the next line of stitching and so on repeatedly, whereby each pair of signatures is held together by a series of knotted and unknotted threads, the knots of adjoining series effecting each other, substantially as shown and described.

5. A series of signatures sewed together by stitching consisting of a loop of one thread passed inwardly through the back of one signature and outwardly through the back of the same signature at another point, a loop of a second thread knotted with the first loop at that point and passed inwardly through the back of the next signature and outwardly through that back at another place, and then knotted with a second loop of the first thread and so on repeatedly whereby there are knots between every alternate pair of signatures effecting knots between intervening pairs of signatures, substantially as shown and described.

6. A series of signatures sewed together by stitching, consisting of a loop of one thread passing inwardly through the back of one signature and outwardly through the back of the same signature at another point, a loop of another thread passing through the end of the first-mentioned loop outside of the signature, a second loop in the second thread passing through the first loop in the second thread and inwardly through the back of the next signature and outwardly through its back at another place, and another loop of the first thread passing through the last loop of the second thread and a second loop in the first thread passing through the partly-formed loop in said thread and through the back of the signature and so on repeatedly, substantially as shown and described.

697,044. TRANSVERSELY-DIVIDED BOOT OR SHOE LAST AND UNION THEREFOR. ARTHUR TYLER, JR., Brighton, Mass. Filed July 26, 1901. Serial No. 69,768. (No model.)

Claim.—1. The combination of the fore part and heel part of a boot or shoe last, or analogous device, with a flanged disk which is mounted in recesses in said parts, connects said parts and permits movement of one part in relation to the other part; and means for keeping said flanged disk in working position.

2. The combination of the fore part and heel part of a boot or shoe last, or analogous device, with a pair of flanged disks which are mounted in recesses in said parts, connect said parts and permit movement of one part in relation to the other part; and a separator inserted between said disks.

3. The combination of the fore part and heel part of a boot or shoe last, or analogous device, with a union which is mounted in recesses in said parts, connects said parts, and permits movement of one part in relation to the other part; said union comprising flat surfaces which contact with opposed fore part and heel part surfaces that are at right angles to transverse sections of the same, and each contact effecting a lateral pressure that resists said relative movements of the fore part and heel part, and tends to prevent accidental collapsing of the last, said union comprising a pair of flanged disks, and said recesses being formed with flange-receiving recesses, whereby the heel part and fore part are held in operative relation with each other.

4. A union for boot and shoe lasts, said union comprising a pair of flanged disks and a separator.

897,045. MATTRESS-FILLER. GEORGE W. WARREN, Phila-
delphia, Pa. Filed Mar. 28, 1901. Serial No. 58,181. (No model.)

Claim.—1. A mattress-filling machine comprising a supporting-frame, an adjustable roller mounted therein, a sliding gate, and means for simultaneously adjusting said roller and operating said gate, as set forth.

2. A mattress-filling machine comprising a frame, a roller mounted therein, means for adjusting said roller angularly, a conveyor comprising two removing-sheets, means for varying the width of said conveyor, and means for simultaneously operating said conveyor and rotating said roller, as set forth.

3. A mattress-filling machine comprising a supporting-frame, an adjustable roller mounted therein, means for adjusting the same, a conveyor, a sliding gate, and connections between said roller and said gate, whereby they are moved simultaneously, as set forth.

4. A mattress-filling machine comprising a supporting-frame, an adjustable roller mounted therein, means for adjusting the same, a conveyor, a sliding gate, connections between said roller and said gate, whereby they are moved simultaneously, and means for simultaneously operating said conveyor and rotating said roller, substantially as set forth.

5. A mattress-filling machine comprising a supporting-frame, an adjustable roller mounted therein, means for adjusting the same, a conveyor, a sliding gate, a lever pivoted in said frame and having connections with said roller, and connections between said lever and said sliding gate, substantially as set forth.

6. A mattress-filling machine comprising a supporting-frame, a shaft mounted therein and having radial arms, a roller mounted between said arms, a lever connected to said shaft, a conveyor, a sliding gate, and connections between said lever and said gate, substantially as set forth.

7. A mattress-filling machine comprising a supporting-frame, a shaft mounted therein and having radial arms, sprocket-wheels mounted loosely on said shaft, a roller mounted between said arms and carrying sprocket-wheels on each end, chains connecting the sprocket-wheels of said roller with those of said shaft, means for rotating said latter sprocket-wheel, a lever connected to said shaft, a conveyor, a sliding gate, and connections between said lever and said gate, substantially as set forth.

8. A mattress-filling machine comprising a supporting-frame, a conveyor mounted therein, removing-sheets arranged to be fed thereby, sprocket-chains arranged to vary the relative positions of said removing-sheets, a sliding gate mounted in said frame, means for operating the same and means for operating said conveyor, as set forth.

9. A mattress-filling machine comprising a supporting-frame, a conveyor mounted therein, removing-sheets arranged to be fed thereby, a rail connected to one of said removing-sheets, means for adjusting said rail, and means for operating said conveyor, substantially as set forth.

10. A mattress-filling machine comprising a supporting-frame, a conveyor mounted therein, removing-sheets arranged to be fed thereby, sprocket-wheels mounted in said frame, chains connecting said wheels, a rail connected to one of said removing-sheets and also to said chains, means for rotating said sprocket-wheel, and means for operating said conveyor, substantially as set forth.

11. A mattress-filling machine comprising a supporting-frame, a conveyor mounted therein, tick-supports one of which is adjustable with relation to the other, removing-sheets arranged to be fed by said conveyor, and means for simultaneously adjusting said tick-supports and said removing-sheets, as set forth.

12. A mattress-filling machine comprising a supporting-frame, a conveyor mounted therein, removing-sheets arranged to be fed thereby, a rail connected to one of said removing-sheets, tick-supports, one of which is connected to said rail, and means for adjusting said rail, substantially as set forth.

13. A mattress-filling machine comprising a supporting-frame, a roller mounted therein, means for adjusting said roller radially, a sliding gate, connections between said roller and said gate whereby they are both operated simultaneously, a conveyor, means for operating the same, removing-

sheets carried by said conveyor, and means for adjusting the width thereof, substantially as set forth.

14. A mattress-filling machine comprising a supporting-frame, a roller mounted therein, means for adjusting said roller radially, a sliding gate, connections between said roller and said gate whereby they are both operated simultaneously, a conveyor, means for operating the same, removing-sheets carried by said conveyor, a rail connected to one of said removing-sheets, tick-supports one of which is connected to said rail, and means for varying the position of said rail, substantially as set forth.

897,046. PUMP. ED. WARREN, Edwards, Kans. Filed Apr. 13, 1901. Serial No. 58,739. (No model.)

Claim.—In a pump-actuating mechanism, the combination with the pump barrel or stock, and upper and lower pistons in the barrel, of vertical side pieces provided with parallel vertical slots in their inner faces arranged with guideways between them, head-blocks slidingly disposed in said guideways, rods 14, 15, secured to and depending from each of said blocks, a vertically-rocking handle fulcrumed between the said side pieces and pivotally connected to the lower end of said rods 14, 15, and plunger-rods having their upper ends fastened to the sliding blocks and their lower ends secured to the upper and lower pistons, respectively.

897,047. CLOSED MEASURING-CAN. CHARLES E. WHEELER, Minneapolis, Minn. Filed July 5, 1901. Serial No. 67,138. (No model.)

Claim.—1. The combination with a can having perforations in its bottom and having a pivoted valve for opening and closing said perforations

tion, of a measuring-cup adapted to detachably telescope with and rotate with respect to said can, said cup having detachable connection with said valve, whereby said valve may be operated while said cup closes the end of said can and said cup is adapted to be removed with the measured load, substantially as described.

2. The combination with a can having perforations in its bottom, and having a pivoted valve for opening and closing said perforations, of a measuring-cup having an adjustable false bottom, which cup telescopes with and rotates with respect to said can and has detachable engagement with said valve, whereby the said valve may be operated, by rotary movement of said cup while in operative position, substantially as described.

697,048. LOCK-LIFTER FOR RAILWAY AUTOMATIC COUPLING. THOMAS WILSON, Paw Paw, Mich. Filed July 21, 1899. Renewed Sept. 17, 1900. Serial No. 20,344. (No model.)

Claim.—1. An unlocking device for car-couplers consisting of oppositely-arranged safety-hooks, and a compression-spring engaged therewith, with an adjustable arm extending into proximity to the corresponding hook for the purpose described.

2. An unlocking device for car-couplers consisting of oppositely-arranged safety-hooks, and a compression-spring engaged therewith, each of said safety-hooks constructed with metal turned back upon itself intermediate its ends, and a spring-arm for the purpose described.

3. An unlocking device for car-couplers consisting of oppositely-arranged safety-hooks, each provided with a spring-arm extending into proximity to the corresponding hook, and a compression-spring engaged at its opposite ends with said safety-hooks, for the purpose described.

4. An unlocking device for car-couplers consisting of oppositely-arranged safety-hooks, and a flat coiled compression-spring engaged therewith, substantially as described.

5. An unlocking device for car-couplers consisting of oppositely-arranged safety-hooks, and a compression-spring engaged therewith, each of said safety-hooks constructed of metal turned back upon its intermediate ends to form a hook portion at one end thereof, and a looped portion at the other end thereof, one extremity of said metal projecting from the opposite end thereof to form a spring-arm extending from the looped portion to the hooked portion of the safety-hook, for the purpose described.

6. An unlocking device for car-couplers consisting of oppositely-arranged safety-hooks and a flat coiled compression-spring engaged therewith, the ends of said spring being turned inward to engage the loops of said safety-hooks for the purpose set forth.

7. An unlocking device for car-couplers consisting of oppositely-arranged hooks having spring-arms terminating adjacent to the hooked ends thereof, a compression-spring engaged therewith and means extending transversely of the springs to engage the extremities of the spring with the corresponding ends of the hooks to secure the compression of the spring for the purpose described.

8. The combination with a vertical-hook car-coupler, having a knuckle hinged to swing laterally, of a rock-bar, a locking device and an unlocking device consisting of hooks having spring-arms terminating adjacent to the hooked ends thereof and a compression-spring, one end of one of said hooks engaged with the rock-shaft and the opposite end of the other hook engaged with the locking device for the purpose set forth.

9. The combination with the locking device of an automatic car-coupling and a rock-shaft, of a compression-spring, transversely-disposed device at the respective ends of the spring, hooks directly engaging said device, extending longitudinally of the spring and having their hooked ends projecting beyond the other ends of the spring, one of said hooks connected with the rock-shaft and another attached to the locking device.

697,049. HOSE-SUPPORTER. CLARA E. WHEELER, New York, N. Y. Filed Nov. 2, 1891. Serial No. 21,161. (No model.)

Claim.—1. A hose-supporter, comprising a band adapted to pass across the wearer's back and having curved portions formed to extend downwardly forward of the hips and in a backward or return direction below the latter, means for attachment to the hose supported by the ends of said band in a position at one side of the wearer's limbs, and an elastic band connected to the opposite sides of the first-mentioned band adapted to extend across or below the abdomen, for the purpose set forth.

2. A hose-supporter comprising a band adapted to pass across the wearer's back and being formed with a dip or downwardly-curved portion therein and also having curved portions formed to extend downwardly forward of the hips and in a backward or return direction below the latter, means for attachment to the hose supported by the ends of said band in a position at one side of the wearer's limbs, and a second band connected to the opposite side of the first-mentioned band adapted to extend across or below the abdomen, for the purpose set forth.

697,050. CUTTER-BAR. DAVID E. WHITE, Winchester, Kans. Filed Oct. 10, 1891. Serial No. 73,172. (No model.)

Claim.—1. The combination with a cutter-bar, of two sets of outer-blades, each member of one set having oppositely-directed lateral attaching-ears applied to the bar, the upper faces of the ears being below the upper faces of the blades, said blades being spaced at predetermined intervals to receive the members of the other set of outer-blades, the latter resting upon the opposite ears of adjacent blades and flush with the upper faces thereof.

2. A cutter-bar, having a pair of outer-blades which are provided with opposite laterally-projected ears applied to the bar and having their upper faces located below the upper faces of the blades, another blade applied flat against the opposite ears of the first-mentioned pair of blades, and fastenings pivoting said blades, the ears and the bar, the upper faces of all of the blades being flush.

3. A cutter-bar having two sets of outer-blades, each member of one set having its rear end portion folded upon the under side thereof and projected at opposite sides of the blade to form attaching-ears, and the members of the other set of blades being applied to the opposite ears of adjacent blades, the upper faces of all of the blades being flush, and fastenings pivoting the bar, the ears and the blades applied thereto.

4. As a new article of manufacture, a cutter-blade having its rear edge portion folded over upon the under side thereof and also projected at opposite edges of the blade to form attaching-ears.

5. As a new article of manufacture, a cutter-blade which is substantially triangular in shape and has its opposite side edges beveled to form cutting edges, the rear edge portion of the blade being folded over upon the under side thereof and also projected at opposite edges to form attaching-ears, each of the latter being provided with a perforation for the reception of a fastening, and the folded portion being provided with an intermediate perforation.

697,051. JUNCTION-BOX COUPLING. MORRIS F. WHITTON, Hingham, Mass. Filed Aug. 28, 1901. Serial No. 72,597. (No model.)

Claim.—1. The combination with a box having a hole through its wall, of a coupling member having a longitudinal hole through it and having a neck at one end formed with a lateral projection or flange at its extremity which projects through the hole in the wall and a locking device for securing said coupling member to the box which engages said projection or flange, substantially as described.

2. The combination with a box having a hole through its wall, of a coupling member having a longitudinal hole through it and having a neck at one end formed with a lateral projection or flange at its extremity which projects through the hole in the wall and a locking device adapted to be interposed between said projection or flange and the wall of the box for securing said coupling member to the box, substantially as described.

3. The combination with a box having a hole through its wall, of a coupling member having a longitudinal hole through it and having a neck at one end formed with an annular flange at its extremity which projects through the hole in the wall and a locking device adapted to be interposed between said annular flange and the wall of the box for securing said coupling member to the box, substantially as described.

4. The combination with a box having a hole through its wall, of a coupling member having a longitudinal hole through it and having a neck at one end formed with a lateral projection or flange at its extremity which projects through the hole in the wall and a yoke adapted to be interposed between said projection or flange and the wall of the box for securing said coupling member to the box, substantially as described.

5. The combination with a box having a hole through its wall, of a coupling member having a longitudinal hole through it and having a neck at one end formed with a lateral projection or flange at its extremity which projects through the hole in the wall, and a yoke having a lateral projection at its crown adapted to be interposed between said projection or flange and the wall of the box for securing said coupling member to the box, substantially as described.

6. The combination with a box having a hole through its wall, of a coupling member having a longitudinal hole through it consisting of a cylindrical body shouldered at one end to form a neck which is provided with a projection or flange at its extremity, said neck projecting through the hole in the wall and the shoulder abutting against the outer side of the wall, and a locking device interposed between the projection or flange and the inside of the wall for securing said coupling member to the box, substantially as described.

697,052. JUNCTION-BOX. MORRIS F. WHITTON, Hingham, Mass. Filed Aug. 31, 1901. Serial No. 72,598. (No model.)

Claim.—A junction-box having holes for the pipes and removable or penetrable pieces contained in said holes formed as caps having end walls and side walls and having flanges engaging the wall of the box by which they are retained in place, substantially as described.

697,053. BRAKE FOR PROPELLER-SHAFTS. GEORGE WHITNEY, New London, Conn. Filed Dec. 19, 1900. Renewed Jan. 29, 1902. Serial No. 91,042. (No model.)

Claim.—1. In a device for preventing racing of marine engines, a float subjected to variation in water-pressure near the propeller, valves controlled by said float governing means for applying a resistance to the rotation of the propeller.

2. In a device for preventing racing of marine engines, a float subjected to variation in water-pressure near the propeller, means electrically controlled by said float for applying a power resistance to the rotation of the propeller when the normal resistance is decreased.

3. In a device for preventing racing of marine engines, a float operable by variations in pressure near the propeller for controlling the application of resistance to the rotation of the propeller, which resistance shall be independent of the power of the float.

4. In a device for preventing racing of marine engines, a float operable by variations in pressure near the propeller for controlling the application of an adjustable resistance to the rotation of the propeller when the normal resistance is decreased.

5. In a device for preventing racing of marine engines, a float adjustable in sensitiveness operable by variations in water-pressure near the propeller for controlling the application of resistance to the rotation of the propeller.

6. In a device for preventing racing of marine engines, an adjustable float operable by variations in water-pressure near the propeller for electrically controlling the application of resistance to the rotation of the propeller.

7. In a device for preventing racing of marine engines, a float adjustable in position and operable by variation in the water-pressure and by springs, means controllable by the action of said float for applying resistance to the rotation of the engine-shaft, when the resistance is decreased.

8. A governor for a marine engine comprising a brake mechanism for the propeller-shaft and brake being actuated by a fluid-pressure and pressure being in turn governed by a float, the fluid-pressure being independent of the power of the float.

9. In a device for preventing racing of marine engines, a float actuated by the pressure of water beneath it, said float controlling by an electrically-operated valve when said pressure is decreased the application of a power-brake to prevent undue increase in speed of the engine.

10. A governor for marine engines comprising a p.s.ing means, a float, means for applying resistance to the said propelling means which may be independent of the power of said float said resistance being controlled by said float.

697,054. SELF-TIGHTENING KEY FOR PULLEYS. FRANK WIGGINS, Tacoma, Wash. Filed Mar. 2, 1901. Renewed Dec. 29, 1901. Serial No. 87,377. (No model.)

Claim.—In combination with a shaft and split pulley, one of the adjacent edges of the section of said pulley being recessed, the bottoms of the recesses being straight and inclined in relation to each other, the oppositely-disposed keys curved on their inner toothed faces, and straight on their opposite faces to correspond with the walls of said recesses, as set forth.

697,055. INNER TUBE FOR PNEUMATIC TIRES. FRANK A. WILSON, Erie, Pa. Filed Feb. 4, 1902. Serial No. 92,892. (No model.)

Claim.—In an inner tube for pneumatic tires, an end closure comprising the end portion thereof turned back into the tube, and one side of the interned portion of the tube cemented to the inner surface of the tube, and the adjacent face of said interned portion of the tube then cemented together, substantially as set forth.

697,056. RUBBER TIRE-SETTING MACHINE. JOHN E. WILLIAMS, Akron, Ohio. Filed Oct. 14, 1901. Serial No. 73,694. (No model.)

Claim.—1. In a machine for placing rubber tires on vehicle-wheels the combination of means to hold one end of the wire, means for holding back the rubber on the other end of said wire and means situated intermediate of said previously-mentioned means for drawing said wire taut.

2. The combination of two clamping-arms arranged substantially radial to the wheel to be fitted and means for drawing said wire taut situated intermediate said clamping-arms.

3. In a machine for placing rubber tires on vehicle-wheels consisting of a clamping-arm to hold one end of said wire, a second clamping-arm adapted when so desired to clamp said wire, a tightening device situated between said clamping-arms, substantially as shown and described.

4. The combination in a machine for placing rubber tires on vehicle-wheels consisting of two clamping-arms arranged substantially radial to the axis thereof, two separate tightening means situated between said clamping-arms to draw said wire taut independently of each other, substantially as shown and described.

5. The combination in a machine for placing rubber tires on vehicle-wheels consisting of two clamping-arms arranged substantially radial to the axis of said wheel and two tightening devices situated intermediate of said clamping-arms to be operated either singly or in conjunction with each other as desired, substantially as shown and described.

6. The combination in a machine for placing rubber tires on vehicle-wheels consisting of two clamping-arms arranged substantially radial to the axis of the wheel, means as a U-shaped cap for supporting said wheel during said operation, a g... is attached to said U-shaped cap to retain said cap constantly in one direction and means as winding-shafts situated intermediate said clamping-arms to tighten said wire, substantially as shown and described.

7. The combination in a machine for placing rubber tires on vehicle-wheels consisting of a pair of clamping-arms pivoted on bolts attached to the housing arranged to form fulcrums for said clamping-arms and means situated between said clamping-arms to draw said wire taut, substantially as shown and described.

8. The combination in a machine for placing rubber tires on vehicle-wheels consisting of a housing, vertical slot in said housing, a vertically sliding clamping device traveling in said slot, a pair of levers attached to said clamping device at one end severally attached to the upper end of rotating clamping-jaws arranged to grip the wire in placing said tire constructed to be placed radial to said wheel-axis by the vertical motion of said clamping device and said slot, substantially as shown and described.

9. The combination in a machine for placing rubber tires on vehicle-wheels consisting of a housing to support said device and an adjustable clamping device attached to travel in a vertical slot in said housing and

adjust the position of two clamping-arms, two clamping-arms adapted to grasp the wire used in placing said tire, and means as winding-shafts to draw said wire situated between said clamping-arms, substantially as shown and described.

10. The combination in a machine for placing rubber tires on vehicle-wheels consisting of two clamping-jaws radially adjustable, means as two winding-shafts situated in the housing supporting said clamping-jaws and means adapted to revolve said winding-shafts in unison or separately, substantially as shown and described.

11. In a machine for placing rubber tires on vehicle-wheels consisting of a housing suitably supported, a pair of winding-shafts situated in said housing intermediate said clamping-jaws and means to revolve said winding-shafts independently or in unison, as desired, substantially as shown and described.

12. In a machine for placing rubber tires on vehicle-wheels consisting of a housing suitably supported, two clamping-jaws mounted thereon and capable of radial adjustment, means as two winding-drums situated between said clamping-jaws to tighten said wires used in placing said tire and means as a crank-shaft bearing a tight pinion-gear to rotate said winding-shafts either independently or in unison, substantially as shown and described.

13. In a machine for placing rubber tires on vehicle-wheels consisting of a housing suitably supported, a pair of clamping-jaws radially adjustable, a pair of winding-shafts to tighten the wire used in placing said tire, a slot in the end of said shafts to start the rotation of said wires and permit their free removal therefrom, means such substantially as shown for rotating said winding-shafts either independently or in unison.

14. In a machine for placing rubber tires on vehicle-wheels consisting of a housing suitably supported, clamping-jaws radially adjustable mounted thereon, a pair of winding-shafts situated between said clamping-arms capable of longitudinal movement as the number of coils of wire thereon renders the same necessary and means for causing the revolution of said winding-shafts to rotate independently or in unison, substantially as shown and described.

15. In a machine for placing rubber tires on vehicle-wheels consisting of a housing suitably supported, a pair of clamping-arms mounted thereon radially adjustable, a pair of winding-drums situated between said clamping-arms arranged to draw taut the wire used in placing said tire, means as gear-wheels mounted on said winding-shafts to rotate said shafts, a pair of rocking pawls mounted on said housing adapted to permit the rotation of said gear-wheels and shafts in one direction and prevent it in the opposite direction, and means such substantially as shown for rotating said gears and shafts independently or in unison, substantially as shown and described.

16. The combination in a machine for placing rubber tires on vehicle-wheels consisting of a housing suitably supported, a pair of clamping-jaws mounted thereon radially adjustable, a pair of winding-shafts situated between said clamping-jaws, gear-wheels mounted on said winding-shafts to control the rotation thereof, said winding-shafts being capable of longitudinal motion, a plate mounted on a pin on said housing to retain said gears on said winding-shafts and means to rotate said gears independently of each other or in unison, substantially as shown and described.

697,057. REGULATION OF DYNAMO-ELECTRIC MACHINES. THOMAS W. WILLIAMS, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Dec. 4, 1900. Serial No. 28,619. (No model.)

Claim.—1. The combination of a source of alternating current, means for converting the alternating current into direct current, and automatic means for compensating for variation of voltage of the direct current occasioned by variation of frequency of the alternating current.

2. The combination of a prime-mover, an alternating-current generator driven thereby, a motor-generator arranged to receive energy from said alternating-current generator, and automatic means for compensating for variation of voltage of the generator element of said motor-generator occasioned by fluctuations in speed of the prime mover.

3. The combination of a prime mover, an alternating-current generator driven thereby, transmission-lines extending from said generator, a motor-generator set fed with current derived from said transmission-lines, and means for regulating the electromotive force of the generator element of the motor-generator set in accordance with variation of frequency of current in said transmission-lines.

4. The combination of alternating-current and direct-current mains leading respectively from the motor and generator of a motor-generator set, a regulating-generator operatively connected to said generator, and means responsive to the frequency of current in the alternating-current mains for driving said regulating-generator.

5. The combination of alternating-current and direct-current mains leading respectively from the motor and generator of a motor-generator

out, a regulating-generator operatively connected to said generator, and means responsive to the frequency of current in the alternating-current mains for controlling the speed of rotation of said regulating-generator.

697,058. HARROW-TOOTH FASTENING. GLENN T. WILLIAMS and JAMES PORTERSON, Fresno, Cal.; said Williams assignor to said Porterson. Filed Sept. 8, 1901. Serial No. 74,787. (No model.)

Claim.—1. In combination with a harrow-tooth, and a slotted carrying-bar for the same, a clip bearing against one face of the bar, and having an upper and a lower arm extending beyond the plane of the opposite face of the bar, the lower arm passing through the slotted bar, both arms being provided with holes to receive the teeth.

2. In combination with a harrow-tooth and a slotted carrying-bar for the same, a clip bearing against one face of the bar, and having an upper arm passing over the top of the bar, and a lower arm passing through the slotted bar, both arms being provided with holes to receive the teeth.

3. In combination with a harrow-tooth and a slotted carrying-bar for the same, a clip bearing against one face of the bar, and having an upper and a lower arm extending beyond the plane of the opposite face of the bar, the lower arm passing through the slotted bar, and a second clip bearing against the bar under the first clip, and having an upper and a lower arm extending beyond the plane of the opposite face of the bar, the upper arm of said second clip passing through the slotted bar, the arms of both clips being provided with holes to receive the teeth.

4. In combination with a harrow-tooth, and a slotted carrying-bar for the same, a clip bearing against the upper portion of one face of the bar, and having an upper arm passing over the top of the bar, and a lower arm passing through the slotted bar, and a second clip bearing against the lower portion of one face of the bar, and having an upper arm passing through the slotted bar, and a lower arm passing under the bar, the arms of both clips having holes, to receive the teeth.

697,059. CULTIVATOR. GLENN T. WILLIAMS and JAMES PORTERSON, Fresno, Cal.; said Williams assignor to said Porterson. Filed Sept. 20, 1901. Serial No. 75,001. (No model.)

Claim.—1. In a cultivator, the combination of an axle having a collar at its inner end, a cultivator attachment having a hub adapted to be mounted upon said axle, said hub having at one end a socket-flange adapted

to fit over the axle-collar, a composite coupling-flange adapted to be bolted to the socket-flange of said attachment and made of two sections one having an inner opening large enough to pass over the axle-collar and the other having an inner opening too small to pass over said collar, whereby engagement is made and broken with said axle-collar according as the smaller section is fitted in place or removed, and a suitable removable coupling engaging the axle-collar for holding said attachment on the axle, substantially as described.

2. In a cultivator, the combination of an axle having a collar at its inner end, a cultivator attachment having a hub adapted to be mounted upon said axle, said hub having at one end a socket-flange adapted to fit over the axle-collar, and at the other end a collar, a composite coupling-flange adapted to be bolted to the socket-flange of said attachment and made of two sections one having an inner opening large enough to pass over the axle-collar and the other having an inner opening too small to pass over said collar, whereby engagement is made and broken with said axle-collar according as the smaller section is fitted in place or removed, and a suitable removable coupling engaging the axle-collar for holding said attachment on the axle, consisting of a divided box having end sockets adapted to engage the axle-collar and the hub-collar.

3. In a cultivator, the combination of an axle having a collar at one end, a cultivator attachment having a hub adapted to be mounted upon said axle, said hub having at one end a socket-flange adapted to fit over the axle-collar, and a composite coupling-flange secured to the socket-flange and made of two sections, one having an inner opening adapted to pass over the axle-collar and the other having an extended portion adapted to project behind said axle-collar; substantially as described.

4. In a cultivator, the combination of an axle having a collar at its inner end, a cultivator attachment having a hub adapted to be mounted upon said axle, and provided with a collar on one end, and a divided coupling-box having end sockets adapted to engage the axle and hub collars.

5. In a cultivator, the combination of an axle having a collar at its inner end, a cultivator attachment having a hub adapted to be mounted upon said axle, and provided with a collar on one end, a divided coupling-box having end sockets adapted to engage the axle and hub collars when the attachment is in one position and means adapted to engage the axle-collar, for holding said attachment on the axle when the attachment is in reversed position; substantially as described.

6. In a cultivator, the combination with an axle having a collar, a reversible cultivator attachment adapted to be mounted on said axle, and means at the ends of said attachment adapted to engage the collar on the axle to secure the attachment in reversed positions on the axle; substantially as described.

697,060. HARNESS-SADDLE. MATTHEW WILSON, Garrison, Iowa. Filed Nov. 7, 1901. Serial No. 81,000. (No model.)

Claim.—In a saddle, the combination of a saddle-tree provided with upwardly-extending transversely-disposed end loops, and a yoke consisting of a top plate provided with side flanges and having longitudinal extensions or tongues projecting through the end loops and secured to the middle by the same, said tongues being arranged in the same plane as the adjacent portions of the said plate and formed by reducing the same, substantially as described.

697,061. SINGLE-TRIGGER MECHANISM FOR FIREARMS.
 GEORGE E. WILKINSON, Hartford, Conn., assignor to Remington Arms Company, Inc., N. Y., a Corporation of New York. Filed Feb. 15, 1897.
 Serial No. 698,371. (No model.)

Claim.—1. In combination in a firearm, a plural number of hammers, a rear aperture to each of said hammers, a coupler mounted on one of said hammers and having a lateral swinging movement to engage the under surface of the opposite rear and arranged to engage a cam on one of said hammers, the cam on said hammer to operate the coupler, and a trigger aperture to one of said hammers.

2. In combination in a firearm, a plural number of hammers, a rear aperture to each of said hammers, a movable coupler mounted on one of said hammers and adapted to engage the opposite rear, means for moving said coupler, and a trigger aperture to one of said hammers.

3. In combination in a firearm having a plural number of hammers, a rear, a coupler pivotally supported on the rear and having a cam arranged in the path of movement of one of the hammers whereby a lateral swinging movement of the coupler into the path of movement of the rear will operate the opposite rear from that on which the coupler is pivoted is produced, a projection from the coupler extending around to the opposite side of and embracing the rear-tail whereby simultaneous vertical reciprocation of the two is produced, and a trigger.

697,062. ROASTING-FURNACE. LEWIS T. WRIGHT, Kewick, Cal. Filed July 24, 1901. Serial No. 69,598. (No model.)

Claim.—1. In a roasting-furnace, the combination, with a series of floors, of a central hollow shaft, hollow arms carried thereon over the respective floors, an open-bottomed pipe inserted in said shaft, a second open-bottomed pipe in said shaft into which the first pipe discharges intermediate to said first pipe and shaft, open-ended pipes leading from the intermediate pipe into the hollow arms, and feed and exhaust pipes connected to the first pipe and hollow shaft, substantially as described.

2. In a roasting-furnace, the combination, with a series of floors, of a central hollow shaft, hollow arms carried thereon over the respective floors, an open-bottomed pipe in said hollow shaft, open-ended pipes leading from the said open-bottomed pipe into the hollow arms, a feed-pipe to the open-bottomed pipe, and an exhaust-pipe from the hollow shaft, substantially as described.

697,063. SOAP-BUNDLE MOWER. CLARENCE E. ALBERT, Rochester, N. Y., assignor of one-half to Harvey R. Carlton, Rochester, N. Y. Filed Jan. 2, 1902. Serial No. 81,044. (No model.)

Claim.—1. A bubble-blower consisting of a hollow body having a small eduction-aperture and a liquid-receptacle in the body having a small discharge-aperture arranged in proximity to the eduction-aperture in the body.

2. A bubble-blower consisting of a body having a small eduction-aperture and a liquid-receptacle in the body having a small discharge-aperture near that in the body and an air-passage extending around said discharge-aperture.

3. A bubble-blower consisting of a body having a chamber, an eduction-aperture at the end, and an air-passage, a liquid-receptacle arranged in the chamber having a discharge-passage arranged in proximity to the eduction-aperture in the body and separated from the walls of the chamber.

4. In a bubble-blower, the combination with a hollow body having

an air-passage, a chamber and an eduction-aperture at the end of the latter, of a removable liquid-receptacle in the chamber having a small discharge-aperture arranged in proximity to the eduction-aperture in the body.

5. In a bubble-blower, the combination with the body having the chamber provided with the eduction-aperture, and the air-passage leading to the chamber, of the removable liquid-receptacle in the chamber having the small discharge-aperture arranged in proximity to the eduction-aperture in the chamber and separated from the walls of the chamber to permit the passage of air around it.

6. In a bubble-blower, the combination with the body having the chamber provided with the eduction-aperture and the air-passage leading to the chamber, of the removable liquid-receptacle in the chamber having the small discharge-aperture and the stopper therein, of material such as sponge, said aperture being arranged in proximity to the aperture in the chamber.

7. In a bubble-blower, the combination with the body having the chamber and air-passage and a perforated cap at the end of the chamber, of the removable liquid-receptacle in the chamber having a small discharge-aperture arranged in proximity to the cap and separate from the walls of the chamber to permit the passage of air around it.

8. In a bubble-blower, the combination with the body having the chamber provided with an eduction-aperture, of a removable liquid-receptacle having the small discharge-aperture and arranged in the chamber and capable of longitudinal movement therein.

697,064. LACE-FASTENER. ARTHUR E. ANDREWS and BERNARD T. MORRISON, Harrisburg, Pa. Filed Aug. 10, 1901. Serial No. 71,588. (No model.)

Claim.—1. As a new article of manufacture, a shoe-lace fastener consisting of a metal strip doubled upon itself and adapted to fit over a shoe-top, one arm of the strip being longer than the other and bowed outwardly, and the other arm terminating opposite said bowed portion.

2. As a new article of manufacture, a shoe-lace fastener consisting of a metal strip doubled upon itself and adapted to fit over a shoe-top, one arm of the strip being longer than the other and bowed outwardly, and the shorter arm terminating opposite said bowed portion and having its end turned inwardly toward the longer arm.

3. The combination with a shoe-top of a shoe-lace fastener consisting of a metal strip doubled upon itself and having its bent portion fitting over the top of the shoe and its two arms extending downwardly on the inner and outer sides of the shoe-top respectively, the outer arm being longer than the inner arm and bowed outwardly, and the inner arm terminating opposite said bowed portion.

4. The combination with a shoe-top of a shoe-lace fastener consisting of a metal strip doubled upon itself and having its bent portion fitting over and bowed to the top of the shoe and its two arms extending downwardly on the inner and outer sides of the shoe-top respectively, the outer arm being longer than the inner arm and bowed outwardly and the inner arm terminating opposite said bowed portion and having its end turned inwardly toward the longer arm.

697,065. APPARATUS FOR THE TRANSMISSION OF SIGNALS. CLARENCE E. BRADY, Binghamton, N. Y., assignor to Star Electric Company, a Corporation of New York. Filed Apr. 6, 1900. Serial No. 694,494. (No model.)

Claim.—1. Signal-box, a selector controlled by said signal-box, a transmitter, an auxiliary circuit, a circuit-closer forming part of the transmitter and included in said circuit, and connections between the selector and transmitter as arranged so as to suitably vary the number and arrangement of the closures of the auxiliary circuit.

2. Signal-box, a suitable system of conductors connected with said signal-box, a selector connected to said conductors and arranged to respond to a change of connections between them, a transmitter to successively close an electric circuit, connections between the selector and transmitter as arranged so as to suitably vary the number and arrangement of the closures of the auxiliary circuit, constructed for operation substantially as shown and described, so that, when said transmitter is operated the closures produced thereby will form a combination previously chosen to designate the existing connections between the conductors connected with the signal-box during the production of each closure.

3. Signal-box, a suitable system of conductors connected with said signal-box, a selector connected to said conductors and comprising controlling-magnets arranged to respond to a change of connections between them, an auxiliary circuit, a transmitter constructed and arranged to produce impulses in said circuit, constructed for operation substantially as

shown and described, so that, the transmitter will be so governed by the selector that the impulses produced by the transmitter will form a distinctive combination previously chosen to characterize the individual conductor to which the selector-magnets are connected during the production of each impulse.

4. A general circuit, individual conductors, signal-boxes provided with means for diverting a portion of the general circuit through one of the individual conductors, a selector, magnets forming part of and controlling said selector, a series of separately-insulated contacts co-operating with the selector as to cause said magnets to be successively connected to each of the individual conductors, an auxiliary circuit, a transmitter, and connections between the selector and transmitter so arranged as to suitably vary the number and arrangement of the closures of the auxiliary circuit, constructed for operation substantially as shown and described, so that, the impulses produced by the transmitter will form a distinctive combination previously chosen to characterize the individual conductor to which the selector-magnets are connected during the production of each impulse.

5. A general circuit, individual conductors, signal-boxes provided with means for diverting a portion of the general circuit through one of the individual conductors, a selector, magnets forming part of and controlling said selector, a series of separately-insulated contacts co-operating with the selector as to cause said magnets to be successively connected to each of the individual conductors, an auxiliary circuit, a transmitter, and connections between the selector and transmitter so arranged as to suitably vary the number and arrangement of the closures of the auxiliary circuit, constructed for operation substantially as shown and described, so that, the impulses produced by the connections existing between the conductors communicating with the signal-boxes.

6. A general circuit, individual conductors, signal-boxes provided with means for diverting a portion of the general circuit through one of the individual conductors, a selector, magnets forming part of and controlling said selector, a series of separately-insulated contacts co-operating with the selector as to cause said magnets to be successively connected to each of the individual conductors, an auxiliary circuit, a transmitter, means controlled by the transmitter for closing the auxiliary circuit a number of times, and connections between the selector and transmitter so arranged as to suitably vary the number and arrangement of the closures of the auxiliary circuit.

7. A general circuit, individual conductors, signal-boxes provided with means for diverting a portion of the general circuit through one of the individual conductors, a selector, magnets forming part of and controlling said selector, a series of separately-insulated contacts co-operating with the selector as to cause said magnets to be successively connected to each of the individual conductors, an auxiliary circuit, suitably-grouped separately-insulated contacts co-operating with the selector, constructed for operation substantially as shown and described, so that, the

impulses produced by the transmitter will be so governed by the selector that the impulses produced by the transmitter will form a distinctive combination previously chosen to characterize the individual conductor to which the selector-magnets are connected during the production of each impulse.

8. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, means controlled by the other train for closing the auxiliary circuit a number of times, and means operated by the first train for suitably varying the number and arrangement of the closures of the auxiliary circuit.

9. A signal-causing mechanism, a movable part provided with a projection, glass or its equivalent arranged to so maintain the movable part as to restrain the signal-causing mechanism, a spring tending to disengage the movable part from the signal-causing mechanism whenever the glass is broken, and a suitably-supported tube containing the spring and movable part, all so constructed and arranged that if the glass or material be broken and the fracture is not sufficiently complete to permit the movable part to be disengaged from the signal-causing mechanism by the spring the pressure of the portion of the signal-causing mechanism against the projection will so revolve the movable part as to disengage the mechanism and projection.

10. A signal-causing station comprising; an electromagnet, an armature influenced thereby, an arm arranged to normally maintain the armature within the range of the attraction of the magnet and constructed and arranged to be withdrawn from the path of said armature whenever the armature is attracted by the magnet, a movable contact, a stationary contact against which said movable contact has a tendency to rest, an elastic contact so arranged with reference to the movable contact and contact-point that the movable contact will connect therewith whenever forced sufficiently far away from the stationary contact, a portion of the movable contact being placed within the path of said armature.

11. A signal-causing station comprising; an electromagnet, an armature influenced thereby and arranged to operate a circuit-changing device, an arm arranged to support said armature within the range of the attraction of the magnet at certain times and to disengage and be withdrawn from the path of the armature whenever it is attracted by the magnet, said circuit-changing device being constructed and arranged to maintain a certain electric circuit while the armature is being supported by the arm or being attracted by the magnet and to interrupt that circuit and establish another whenever the armature is neither supported by the arm or magnet.

12. A signal-causing station comprising; an electromagnet, an armature influenced thereby and arranged to operate a circuit-changing device, an arm arranged to support said armature within the range of the attraction of the magnet at certain times and to disengage and be withdrawn from the path of the armature whenever it is attracted by the magnet; said circuit-changing device being constructed and arranged to maintain a certain electric circuit while the armature is being supported by the arm or being attracted by the magnet and to interrupt that circuit and establish another whenever the armature is neither supported by the arm or magnet.

13. A normally restrained signal; causing mechanism in combination with an electromagnet, an armature influenced thereby and arranged to operate a circuit-changing device, an arm arranged to support said armature within the range of the attraction of the magnet at certain times and to disengage and be withdrawn from the path of the armature whenever it is attracted by the magnet; said circuit-changing device being constructed and arranged to maintain a certain electric circuit while the armature is being supported by the arm or being attracted by the magnet, and to interrupt that circuit and establish another whenever the armature is neither supported by the arm or magnet.

14. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector-arm operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, a second series of separately-insulated contacts, means controlled by the other train for successively connecting said contacts to one side of the auxiliary circuit, and means operated by the selector-arm for connecting distinctive groups of said contacts to the other side of the auxiliary circuit.

15. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector-arm operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, a second series

of separately-insulated contacts, means controlled by the other train for successively connecting said contacts to one side of the auxiliary circuit, suitably-grouped separately-insulated contacts connected with the second series of contacts, and means operated by the selector-arm for connecting distinctive groups of said contacts to the other side of the auxiliary circuit.

16. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector-arm operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, a second series of separately-insulated contacts, means controlled by the other train for successively connecting said contacts to one side of the auxiliary circuit, suitably-grouped separately-insulated contacts connected with the second series of contacts, means operated by the selector-arm for connecting distinctive groups of said contacts to the other side of the auxiliary circuit, and a switch arranged to release the train operating the selector-arm whenever the other train has arrived at a certain point in its operation.

17. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector-arm operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, a second series of separately-insulated contacts, means controlled by the other train for successively connecting said contacts to one side of the auxiliary circuit, suitably-grouped separately-insulated contacts connected with the second series of contacts, means operated by the selector-arm for connecting distinctive groups of said contacts to the other side of the auxiliary circuit, a shunt around the magnets controlling the train which operates the selector-arm, and a switch controlling said shunt and operated by the other train.

18. Signal-buses provided with means for diverting a portion of a general circuit through an individual conductor, a suitable system of conductors connected with said signal-buses, a selector connected with said conductors and arranged to respond to a change of connections between said conductors, a transmitter, an auxiliary circuit, a circuit-clear forming part of the transmitter and included in said circuit, suitably-grouped separately-insulated contacts cooperating with the selector and connected with the circuit-clear, constructed for operation substantially as shown and described, so that, the impulses produced in the auxiliary circuit at any time will be varied in number and arrangement by the connections existing between the conductors communicating with the signal-buses.

19. A signal-sending station comprising: three or more brushes arranged to have their free ends rest upon a revoluble part provided with conducting-strips arranged to successively connect said brushes in pairs, an electromagnet, an armature influenced thereby and arranged to operate a circuit-changing device, an arm arranged to support said armature within the range of the attraction of the magnet at certain times and to disengage and be withdrawn from the path of the armature whenever it is attracted by the magnet, said circuit-changing device being constructed and arranged to maintain a certain electric circuit while the armature is being supported by the arm or being attracted by the magnet and to interrupt that circuit and establish another whenever the armature is neither supported by the arm or magnet and said armature being constructed and arranged to be withdrawn from the range of the attraction of the magnet whenever it has been successively disengaged from the arm and released by the magnet.

20. Signal-buses provided with means for diverting a portion of a general circuit through an individual conductor, a suitable system of conductors connected with said signal-buses, a selector connected with said conductors and arranged to respond to a change of connections between said conductors, a transmitter, an auxiliary circuit, a circuit-clear forming part of the transmitter and included in said circuit, a series of separately-insulated contacts forming part of and cooperating with the selector and connected with the circuit-clear, constructed for operation substantially as shown and described, so that, the impulses produced in the auxiliary circuit at any time will be varied in number and arrangement by the connections existing between the conductors communicating with the signal-buses, a shunt between certain of the conductors which connect the selector with the signal-buses, and a mechanically-retarded relay controlling said shunt and operated by the auxiliary circuit, constructed for operation substantially as shown and described, so that, said relay will prevent the operation of the selector during the transmission of impulses in the auxiliary circuit.

21. Signal-buses provided with means for diverting a portion of a general circuit through an individual conductor, a suitable system of conductors connected with said signal-buses, a selector connected with said conductors and arranged to respond to a change of connections between them, a transmitter, magnets forming part of and arranged to restrain said transmitter at certain times, an auxiliary circuit including said magnets, and a mechanically-retarded relay connected to the selector and controlling the auxiliary circuit; constructed for operation substantially as shown and described, so that, the transmitter will not be released until a

predetermined time has elapsed after the selector has responded to a change of connections between the conductors connected therewith.

22. A magnetically-restrained normally wound motor, a pinion geared to said motor and revolving with a shaft, a gear fixed to said shaft, an arm mounted upon said shaft and arranged to revolve independently thereof, a pinion supported by said arm and engaging with the gear, an internal gear mounted upon said shaft to revolve independently thereof and engaging with said pinion, an escapement constructed and arranged to control the movement of the internal gear and a circuit-changing device operated by the arm when said arm is in a certain position.

23. A magnetically-restrained normally wound motor, a pinion geared to said motor and revolving a shaft, a revoluble arm mounted upon said shaft and moving independently thereof, a pinion supported by said arm and revolving therewith around the shaft and retaining on its own axis, a gear mounted upon and revolving with the shaft and engaging with said pinion, an internal gear so mounted upon said shaft that it may rotate independently thereof and surrounding the gear and engaging with the pinion, an escapement constructed and arranged to control the movements of the internal gear and a circuit-changing device operated by the arm when said arm is in a certain position.

24. Electromagnets, an armature influenced thereby, a revoluble part provided with a projection capable of engaging with a portion of said armature, a gear moving said revoluble part, a pinion engaging with said gear and with an internal gear, an arm influencing a circuit-changing device and operated by the movement of said pinion around the axis of the gear.

25. Electromagnets, an armature influenced thereby, a revoluble part provided with a projection capable of engaging with a portion of said armature, a gear moving with said revoluble part, an internal gear surrounding and moving independently of said gear, a pinion engaging with the gear and with the internal gear, an arm or lever supporting said pinion and arranged to derive a rotary motion from the movement of the pinion around the axis of the gear and a circuit-changing device influenced by the arm when said arm is in a certain position.

26. Electromagnets, an armature influenced thereby, a revoluble part provided with a projection capable of engaging with a portion of said armature, a gear moving with said revoluble part, an internal gear surrounding and moving independently of said gear, a pinion engaging with the gear and with the internal gear, an escapement arranged to retard the movement of the internal gear, an arm or lever supporting said pinion and arranged to derive a rotary motion from the movement of the pinion around the axis of the gear and a circuit-changing device influenced by the arm when said arm is in a certain position.

27. In a signal-selector; a magnet, an arm influenced thereby and carrying projections, a disk moving between said arm and one of the projections, said disk being provided with projections and indentations for influencing at certain times the position of said arm, and a revoluble part geared to said disk and provided with vanes or projections constructed and arranged to engage with a projection from the arm except when said arm is in a certain position.

28. A general circuit, a selector, magnets forming part of and controlling said selector and included in said circuit, signal-buses provided with means for diverting a portion of the general circuit through an individual conductor, individual conductors extending from the signal-buses to the selector, a switch forming part of the selector and so constructed that it may successively connect the individual conductors with the general circuit, a transmitter, an auxiliary circuit jointly controlled by the selector and said transmitter, a shunt around the selector in the general circuit, a mechanically-retarded relay controlling said shunt and operated by the auxiliary circuit, a relay included in the general circuit between the shunt and the signal-buses, and a shunt for the auxiliary circuit around the selector and transmitter controlled by said relay.

29. In a signal-selector; a magnet, an arm influenced thereby and carrying projections, a disk moving between said arm and one of the projections, said disk being provided with projections and indentations for influencing at certain times the position of said arm, a revoluble part geared to said disk and provided with vanes or projections constructed and arranged to engage with a projection from the arm except when said arm is in a certain position, a normally wound train operating the disk and controlled by said revoluble part, and a commutating device operated by each train and controlling a number of electric circuits.

30. A general circuit, a selector, magnets forming part of and controlling said selector and included in said circuit, signal-buses provided with means for diverting a portion of the general circuit through an individual conductor, individual conductors extending from the signal-buses to the selector, a switch forming part of the selector and so constructed that it may successively connect the individual conductors with the general circuit, a transmitter, an auxiliary circuit jointly controlled by the selector and said transmitter, a shunt around the selector in the general circuit, a mechanically-retarded relay controlling said shunt and operated by the auxiliary circuit, a relay included in the general circuit between the

shunt and signal-boxes, a shunt for the auxiliary circuit around the selector and transmitter controlled by said relay, and a mechanically-retarded relay included in the shunt for the auxiliary circuit around the selector and transmitter and so connected and arranged, that when the current is established in said shunt, said mechanically-retarded relay will immediately establish a connection between the general circuit and a conductor so connected to the switch operated by the selector, that the selector-magnets will arrest the operation of said selector when it has arrived at a point in its operation where it mechanically restrains the transmitter and interrupts the auxiliary circuit.

31. A transmitting device comprising: an arm influenced thereby, a lever pivoted upon said arm the free end of which is arranged to engage with and control a normally wound train, a disk provided with a suitable depression revolved by said train, a follower resting upon said disk and so connected with the lever that it may prevent the engagement of said lever with the train at certain times in spite of the action of the arm.

32. A general circuit, a selector, magnets forming part of and controlling said selector and included in said circuit, signal-boxes provided with means for diverting a portion of the general circuit through an individual conductor, individual conductors extending from the signal-boxes to the selector, a switch operated by the selector and so constructed that it may successively connect the individual conductors with the general circuit, a transmitter, an auxiliary circuit jointly controlled by the selector and said transmitter, a shunt around the selector in the general circuit, a mechanically retarded relay controlling said shunt and operated by the auxiliary circuit, a relay included in the general circuit between the shunt and signal-boxes, a shunt for the auxiliary circuit around the selector and transmitter controlled by said relay, a mechanically-retarded relay included in the shunt for the auxiliary circuit around the selector and transmitter and so connected and arranged that when the current is established in said shunt said mechanically-retarded relay will immediately establish a connection between the general circuit and a conductor so connected to the switch operated by the selector that the selector-magnets will arrest the operation of said selector when it has arrived at a point where it mechanically restrains the transmitter and interrupts the auxiliary circuit, and a shunt around the selector-magnets controlled by said mechanically-retarded relay, constructed for operation substantially as shown and described, so that, when the circuit by which said relay is controlled has not been established for a predetermined period of time said shunt will be completed around the magnets of the selector.

33. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, means controlled by the other train for closing the auxiliary circuit a number of times, means operated by the first train for suitably varying the number and arrangement of the closures of the auxiliary circuit, and a switch arranged to release the train operating the selector-arm whenever the other train has arrived at a certain point in its operation.

34. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, means controlled by the other train for closing the auxiliary circuit a number of times, means operated by the first train for suitably varying the number and arrangement of the closures of the auxiliary circuit, a shunt around the magnets controlling the train which operates the selector-arm, and a switch controlling said shunt and operated by the other train.

35. A selecting device comprising: a magnet, an arm influenced thereby and carrying projections, a disk moving between said arm and one of the projections said disk being provided with projections and indentations for influencing at certain times the position of said arm, a revolvable part geared to said disk and provided with vanes or projections constructed and arranged to engage with a projection from the arm except when said arm is in a certain position, a normally wound train operating the disk and controlled by said revolvable part and a commutating device operated by each train and controlling a number of electric circuits; and a transmitting device comprising electromagnets, an arm influenced thereby, a lever pivoted upon said arm the free end of which is arranged to engage with and control a normally wound train, a disk provided with a suitable depression revolved by said train, a follower resting upon said disk and so connected with the lever that it may prevent the engagement of said lever with the train at certain times in spite of the action of the arm.

36. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, means controlled by the other train for closing the auxiliary circuit a number of times,

means operated by the first train for suitably varying the number and arrangement of the closures of the auxiliary circuit, and means for releasing the train operating the selector-arm whenever the other train has arrived at a certain point in its operation.

37. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, means controlled by the other train for closing the auxiliary circuit a number of times, means operated by the first train for suitably varying the number and arrangement of the closures of the auxiliary circuit, a shunt for the general circuit, and a mechanically-retarded relay controlling said shunt and operated by the auxiliary circuit, so constructed that said relay will prevent the operation of the selector during the transmission of impulses in the auxiliary circuit.

38. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, means controlled by the other train for closing the auxiliary circuit a number of times, means operated by the first train for suitably varying the number and arrangement of the closures of the auxiliary circuit, a shunt for the general circuit, and a mechanically-retarded relay controlling said shunt and operated by the auxiliary circuit.

39. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, means controlled by the other train for closing the auxiliary circuit a number of times, means operated by the first train for suitably varying the number and arrangement of the closures of the auxiliary circuit, and a mechanically-retarded relay controlled by the general circuit and so controlling the second train that said train will not be released until a predetermined time has elapsed after the general circuit has been reestablished.

40. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, means controlled by the other train for closing the auxiliary circuit a number of times, means operated by the first train for suitably varying the number and arrangement of the closures of the auxiliary circuit, and a mechanically-retarded relay connected with the selector and so controlling the other train that said train will not be released until a predetermined time has elapsed after the selector has come to rest.

41. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, two magnetically-controlled trains, a selector operated by one of them to successively connect the other side of the general circuit to the contacts, an auxiliary circuit, means controlled by the other train for closing the auxiliary circuit a number of times, means operated by the first train for suitably varying the number and arrangement of the closures of the auxiliary circuit, means operated by the selector for interrupting the auxiliary circuit whenever the general circuit has been interrupted, and a mechanically-retarded relay controlled by the general circuit and so constructed and arranged that when the general circuit has been interrupted said relay will provide a shunt for the auxiliary circuit around the break produced by the selector and maintain said shunt until a predetermined period of time has elapsed after the general circuit has been reestablished.

42. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, a magnetically-controlled selector to successively connect the other side of the general circuit to the contacts, a magnetically-controlled transmitter, an auxiliary circuit jointly controlled by the selector and said transmitter, a shunt around the selector in the general circuit, and a mechanically-retarded relay controlling said shunt and operated by the auxiliary circuit.

43. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, a magnetically-controlled selector to successively connect the other side of the general circuit to the contacts, a magnetically-controlled transmitter, an auxiliary circuit jointly controlled by the selector and said transmitter, a shunt around the selector in the general circuit, a mechanically-retarded relay controlling said shunt and operated by the auxiliary circuit, a relay included in the general circuit outside of the shunt, and a shunt for the auxiliary circuit around the selector and transmitter controlled by said relay.

44. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, a magnetically-controlled selector to successively connect the other side of the general circuit to the contacts, a magnetically-controlled transmitter interlocking with the selector, an auxiliary circuit jointly controlled by the selector and said transmitter, a shunt around the selector in the general circuit, a mechanically-retarded relay

controlling said chest and operated by the auxiliary circuit, a relay included in the general circuit outside of the chest, a chest for the auxiliary circuit around the selector and transmitter controlled by said relay, and a mechanically-retarded relay included in the chest for the auxiliary circuit around the selector and transmitter, and so connected and arranged that when a current is established in said chest, said mechanically-retarded relay will immediately establish a connection between the general circuit and a separately-insulated contact co-operating with the selector, that the selector will be stopped when it has arrived at a point in its operation where it mechanically restrains the transmitter and interrupts the auxiliary circuit.

46. A general circuit, a series of separately-insulated contacts connected to one side of said circuit, a magnetically-controlled selector to successively connect the other side of the general circuit to the contacts, a magnetically-controlled transmitter interlocking with the selector, an auxiliary circuit jointly controlled by the selector and said transmitter, a chest around the selector in the general circuit, a mechanically-retarded relay controlling said chest and operated by the auxiliary circuit, a relay included in the general circuit outside of the chest, a chest for the auxiliary circuit around the selector and transmitter controlled by said relay, a mechanically-retarded relay included in the chest for the auxiliary circuit around the selector and transmitter, and so connected and arranged that, when a current is established in said chest, said mechanically-retarded relay will immediately establish a connection between the general circuit and a separately-insulated contact co-operating with the selector that the selector will be stopped when it has arrived at a point in its operation where it mechanically restrains the transmitter and interrupts the auxiliary circuit, and a circuit shunting the selector-magnets and so controlled by said mechanically-retarded relay that, when the general circuit has not been established for a predetermined period of time, the selector will be released.

697,066. WATCHMAN'S-CLOCK-KEY HOLDER. ALON RUTHER, Chicago, Ill. Filed Nov. 12, 1899. Serial No. 36,161. (No model.)

Claim.—1. In a device for the purpose described the combination of the key, the chest 1 having a ring 12 in one end thereof, the follower 10, a flexible connection between said follower and key for drawing said key into said ring, said key resting normally within said ring, a spring surrounding said flexible connection and bearing between said follower and ring and a knob having operative connection with said key and remaining normally outside of said chest, substantially as set forth.

2. In a device for the purpose described the combination of a chest, a yielding elastic connection in said chest, a key inserted in said chest and connected at its inner end to said elastic connection, a knob adapted to come against the outer end of said chest and an elongated link connecting said knob with said elastic connection at the inner end of said key, substantially as set forth.

3. In a device for the purpose described the combination of a key, a chest for containing said key having one end flattened, a bracket 5, fastening device passing through said bracket 5, said bracket having one member hooked together against and pivoted to said flattened end of the chest and covering said fastening device so as to prevent access to the latter, substantially as set forth.

4. In a device for the purpose described, the combination of a key, means connected with said key and having a flattened end, a bracket 5, fastening device passing through said bracket, said bracket having one member hooked together against and pivoted to said flattened end and covering said fastening device so as to prevent access to the latter, substantially as set forth.

697,067. SULKY HAY-RAKE. ARTHUR B. BLANK, LAMAR, Osh. Filed July 3, 1901. Serial No. 67,667. (No model.)

Claim.—1. In a sulky hay-rake, the combination with the machine-frame, of an angle-iron rake-head, rake-teeth secured thereto, rings on the angle-iron rake-head, and ring-yokes on the machine-frame in which the rings are adapted to turn a complete revolution, whereby the rake is rendered adaptable for turning a complete revolution.

2. In a sulky hay-rake, the combination with an open machine-frame, of a rake-head journaled therein, rake-teeth secured to the rake-head, a ring on the rake-head, and a bracing member secured to the forward portion of the frame and located in the open portion thereof having an antifriction-roller bearing on the ring.

3. In a sulky hay-rake, the combination with an angle-iron rake-head and rake-teeth secured thereto, of rings secured on the rake-head, a machine-frame having ring-yokes in which certain of the rings are journaled to turn a complete revolution, and a bracing member secured to the frame and provided with an antifriction-roller bearing on another of the rings.

chine-frame having ring-yokes in which certain of the rings are journaled to turn a complete revolution, and a bracing member secured to the frame and provided with an antifriction-roller bearing on another of the rings.

4. In a sulky hay-rake, the combination with a revolvable-mounted rake-head and spring rake-teeth connected thereto adapted for a complete and unrestricted revolution to dump the load, of a counterbalancing device positively connected to the rake-head and operatively connecting therewith at all times, said counterbalancing device being adapted to neutralize the desired portion of the natural gravitation of the rake-teeth and assist them to make the complete revolution and also to prevent the rake-teeth from falling heavily on the ground.

5. In a sulky hay-rake, the combination with a revolvable-mounted rake-head and spring rake-teeth connected thereto adapted for a complete and unrestricted revolution to dump the load, of weighted counterbalancing-arms rigidly connected to the rake-head which are adapted to neutralize the desired portion of the natural gravitation of the rake-teeth and assist them to make the complete revolution and also to prevent the rake-teeth from falling heavily on the ground.

6. In a sulky hay-rake, the combination with a revolvable-mounted rake-head and spring rake-teeth connected thereto adapted for a complete and unrestricted revolution to dump the load, of means for locking the rake-head in normal position, and means for manually imparting momentum to the rake head and teeth at the rake-head is being released, whereby the rotation of the rake-teeth past the position of unstable equilibrium is facilitated.

7. In a sulky hay-rake, the combination with a revolvable-mounted rake-head and spring rake-teeth connected thereto adapted for a complete and unrestricted revolution to dump the load, of a movable lock-lever adapted to lock the rake-head in normal position, a foot-lever for manipulating said lock-lever, and connections whereby when said lock-lever is manipulated by the foot-lever, it is adapted to assist the rotation of the rake-teeth past the position of unstable equilibrium on the unlatching thereof for their revolution.

8. In a sulky hay-rake, a locking and unlatching mechanism comprising the combination with a movable lock-lever, of a foot-lever pivoted thereto, means for locking said lever, a trip-lever having means for unlatching the locking mechanism for the first-named foot-lever, and a spring for returning the parts to normal position.

9. In a sulky hay-rake, a locking and unlatching mechanism comprising the combination with a movable lock-lever, of a foot-lever pivoted thereto, a notched lock-bar connected thereto, a lock-pin adapted to engage said notch, a trip-lever and trip-bar connected together and pivoted to the foot-lever, said trip-bar being adapted to disengage the lock-bar from the pin, and a spring for returning the parts to normal position.

10. In a sulky hay-rake, the combination with the rake or rake-head, rake-frame, and a lock-arm on the rake-head, of a longitudinally-movable rigid lock-lever whose rear end engages the lock-arm and means

for rigidly securing the front end of the lever, whereby the rake-head is rigidly locked when the rake-teeth are gathering the load.

697,068. SELF-LUBRICATING AXLE. MARTIN BARNER, South-land, Ohio. Filed Oct. 18, 1901. Serial No. 73,734. (No model.)

Claim.—In a self-lubricating axle, a tubular shaft having circumferential collar and a plug to close the rear end of the shaft to retain the lubricant therein, a split bearing comprising two longitudinal sections having grooved flanges at their inner ends to fit over the collar of the shaft and at their outer ends terminating in inwardly-extending arched flanges to form an opening to receive the lubricant when the flanges are together, and a suitable stopper to close said opening, the bearing-sections extending beyond the end of the shaft to form a chamber for the lubricant, substantially as and for the purpose set forth.

697,069. APPARATUS FOR CONSUMING SMOKE. LOUIS E. C. REINHARDT, Brooklyn, N. Y. Filed June 12, 1901. Serial No. 64,468. (No model.)

Claim.—1. In a smoke-consumer, the combination of a liquid-containing tank, means for forcing smoke through the liquid contained therein, and means to break up the gaseous globules and separate the solid particles therefrom and cause precipitation thereof, comprising a plurality of agitators having a combined axial and orbital movement.

2. In a smoke-consumer, the combination of a liquid-containing tank, a pipe connecting therewith including a pressure-blower for forcing smoke through the liquid in the tank, a plurality of horizontally-disposed baffle-plates dividing the tank into communicating chambers, and agitators arranged within the said chambers, said agitators having combined axial and orbital movements.

697,070. CAR-TRUCK. CLARENCE GILSON, Chicago, Ill. Filed Aug. 16, 1901. Serial No. 73,133. (No model.)

Claim.—1. In a car-truck, the combination of a frame, a pair of

horizontally-disposed platform-beams, a pair of shafts journaled in said frame under said beams, a pair of cones rigidly secured to each of said shafts and adapted to support said beams, suitable gearing connecting said shafts so that the cones may be operated simultaneously from one part of the truck.

2. In a car-truck, the combination of a frame, a pair of horizontally-disposed platform-beams, a pair of shafts journaled in said frame transversely of said beams, a pair of cones rigidly secured to each of said shafts and adapted to support said beams, suitable gearing connecting said shafts so that the cones may be operated simultaneously from one part of the truck.

3. In a car-truck, the combination of a frame, a pair of horizontally-disposed platform-beams, a pair of horizontal shafts journaled in said frame transversely of said beams, a pair of cones rigidly secured to each of said shafts and adapted to support said beams, a third shaft extending longitudinally of said beams and connected with each of said transverse shafts by a worm and wheel, and means for turning said longitudinal shaft and thereby operating said cones to raise or lower said beams.

697,071. SCREEN. GEORGE W. CHAM, Carbondale, Pa. Filed Feb. 9, 1901. Serial No. 65,995. (No model.)

Claim.—1. In a screen-surface, a plate of uniform thickness throughout, provided with integral, imperforate tumbles, substantially straight from end to end and intersecting each bounded by webs lying in the same plane but out of the plane of said tumbles, substantially as set forth.

2. In a screen-surface, a plate of substantially uniform thickness throughout, provided with transverse elongated interstices disposed in longitudinal series and having parallel side webs, and integral, imperforate tumbles between said series, said tumbles being substantially straight from end to end and arranged out of the plane of said webs, substantially as set forth.

3. In a screen-surface, a plate of uniform thickness throughout, provided with interstices arranged in longitudinal series, the imperforate material of said plate between each series being straight and continuously elevated above the webs bounding the said interstices, substantially as set forth.

4. In a screen-surface, a plate of uniform thickness throughout provided with interstices arranged in longitudinal series and having parallel side webs, the imperforate end webs of the interstices of each series being substantially straight and arranged continuously out of the plane of said side webs, substantially as set forth.

697,072. BEAR-BROW. ALFRED G. BAYNE, Lafayette, Ind. Filed Feb. 1, 1902. Serial No. 92,517. (No model.)

Claim.—1. A device of the class described provided with a plurality of rotating light-reflecting faces or mirrors, arranged at an angle to one another and adapted to throw light from one to the other, whereby the light is flashed in various directions and is deflected, substantially as and for the purpose described.

2. A device of the class described comprising a rotary wheel provided with a series of blades arranged to be acted on by the wind, whereby the wheel is rotated, said blades being arranged at angle to one another and being provided with opposite light-reflecting faces or mirrors, substantially as described.

3. A device of the class described comprising a rotary wheel having vertical blades adapted to be engaged by the wind and provided with

opposite light-reflecting faces or mirrors, and lighting devices located at opposite sides of the wheel, substantially as described.

4. A device of the class described comprising a rotary wheel having a plurality of light-reflecting faces or mirrors, and means for throwing light upon the wheel, whereby flashes of light will be thrown in various directions by the said wheel, substantially as described.

5. A device of the class described comprising a casing, a rotary wheel mounted in the casing and provided with a plurality of light-reflecting faces or mirrors, lamps located at opposite sides of the wheel, and tubular casings surrounding the lamps and provided with apertures facing the wheel, said tubular casing being opaque and forming shields for the lamps, substantially as described.

897,078. BICYCLE-GEAR. BERNARD M. DAVIS, DUNELT, N. Y.
Filed June 10, 1901. Serial No. 63,884. (No model.)

Claim.—1. In a velocipede, the combination, with two driving-shafts arranged parallel with each other, of connecting mechanism constraining the said shafts to revolve simultaneously, means for revolving the said shafts, similar toothed driving-wheels secured on the said shafts, an intermediate shaft arranged between the two said driving-shafts, a toothed pinion secured on the intermediate driving-shaft and gearing into the said wheels, and means for connecting the said intermediate shaft with one of the rear-wheels, substantially as set forth.

2. In a velocipede, the combination, with a frame provided with a forked portion, and two parallel driving-shafts journaled therein, one of the said driving-shafts being provided with cranks and treadles; of sprocket-wheels and toothed wheels secured on the said shafts outside the said forked portion, a drive-chain connecting the said sprocket-wheels, an intermediate shaft journaled in the frame between the two said shafts, a toothed pinion secured on the said intermediate shaft and gearing into the said toothed wheels, a balance-wheel secured on the intermediate shaft in the said forked portion, and means for connecting the said intermediate shaft with one of the rear-wheels, substantially as set forth.

3. The combination in a bicycle driving-gear, of a frame, a crank-shaft mounted therein, a gear and a sprocket-wheel mounted on said crank-shaft, a pinion-shaft, a pinion meshing with the crank-shaft gear, another shaft mounted in the frame, a gear and a sprocket-wheel mounted thereon said gear intermeshing with the gear on the pinion-shaft, a chain connecting said sprocket-wheels and driving them in unison, a balance-wheel and a bevel-gear on said pinion-shaft, a bevel-gear on the rear-wheel hub, and a shaft and bevel-gears thereon connecting the bevel-gear

on the pinion-shaft and the bevel-gear on the wheel-hub, substantially as and for the purpose set forth.

897,074. WOVEN-WIRE FENCING. JAMES H. DUNNIN, Cedar Rapids, Iowa. Filed Sept. 20, 1901. Serial No. 75,575. (No model.)

Claim.—1. A woven-wire fence fabric comprising running-wires and stay-wires connecting them together, the said stay-wires having their meeting ends coiled together, and said coiled meeting ends of said stay-wires being coiled around said running-wires, substantially as described.

2. A woven-wire fence fabric comprising running-wires and stay-wires connecting them together, the said stay-wires having their meeting ends first coiled together and finally coiled around the running-wires, substantially as described.

3. A woven-wire fence fabric comprising running-wires and stay-wires connecting them together, the said stay-wires having their meeting ends coiled and twisted together and then coiled around the running-wires, substantially as described.

4. A woven-wire fence fabric comprising running-wires having offset thereto, and stay-wires having their meeting ends coiled together and coiled around the said offset portions of said running-wires, substantially as described.

897,075. ROTATING-PISTON ENGINE. JONAS DOW, Philadelphia, Pa. Filed Dec. 20, 1900. Serial No. 61,465. (No model.)

Claim.—1. In a rotating-piston engine, in combination, a cylindrical shell or case inclosing and firmly holding in position annular cylinders formed in section and fitted together as described, a continuous main shaft passing through the common axis of said cylinders, disks carried by hubs on said shaft, one to each annular cylinder, piston-supporting arms projecting radially from the peripheries of the said disks, pistons carried by said arms and adapted for rotation through said cylinders, abutment-cylinders with self-contained seats rotating in bearings formed in or carried by the outside shell or case and furnished with ports for the passage of the pistons, gears whereby said abutment-cylinders and said piston-carrying disks are caused to be rotated synchronously, and valves for controlling the admission and exhaust of the actuating fluid to and from said cylinders.

2. In a compound rotating-piston engine, in combination, high and low pressure annular cylinders, having their axis of generation identical with that of a main shaft which is continuous through the whole series, placed side by side upon different planes, each cylinder having its center of gyration a circle and its transverse section also in the form of a circle, sectional two-part shells in which each of said cylinders is

formed which are furnished with radial and central braces and with ribs for firm holding in an outside case forming part of the central cylinder-casing and against one another, said outside case, a central and common shaft, disks, one for each cylinder, carried by said shaft carrying radial piston-supporting arms, pistons carried by said arms, cylindrical rotating abutments, furnished with integrally-constructed seats, for closing and opening the continuity of said annular cylinders at one radial point and with parts for the passage of the pistons, means for synchronously rotating said pistons and said abutments, and means for admitting the actuating fluid to and for exhausting it from said cylinders.

3. The combination is a rotating-piston engine, of annular high and low pressure cylinders placed concentrically around a common axis but upon different planes, each cylinder having the internal form of a ring of circular cross-section and formed by a shell supported and braced externally, the common axis of said cylinders being identical with that of a main shaft passing continuously through the center of a cylindrical outside case forming part of the casing of the central cylinders, said annular cylinders being formed in removable transverse sections, one fitting into another by slip-joints, to form steam-tight and continuous interiors, and with exterior braces and flanges by means of which they are firmly held in position within the outside case, said outside case divided through its transverse center through to a bearing upon the main shaft by an annular partition flanked by latitudinal braces or webs dividing the case-casing into two parts and separating the two annular cylinders contiguous to the center and to each other while interposing insulating-spaces between them, each of said contiguous annular cylinders having one transverse half formed in the said transverse partition of the outside case and integral with it, but its mating transverse half is formed in one of the said removable sections, circular disk-like pistons rotating within said cylinders, arms, which carry said pistons, fixed upon radially-carried disks, means for preventing free circulation of steam through one portion of said cylinders during its action upon said pistons, and means for controlling and conducting admission of steam to and its exhaust from said cylinders.

4. The combination with the annular cylinder and the main shaft of a rotating-piston engine of a disk carried by and at right angles to said shaft, one portion of said disk being extended to form a double-armed and inner braced piston-holder, a circular removable piston cut away to permit fitting within the holder and over its inner braced portion, a packing ring or rings adapted to be inserted in said piston and to pass around its periphery from one side of said cut-away portion to the other side thereof, and the ends of which are adapted to enter said holder one end upon one side, the other at the other side, and to form, in addition to a steam-tight joint between said cylinder and piston, means for securing said piston to said holder.

5. The combination is a compound rotating-piston engine, of annular cylinders placed side by side and having their centers of generation identical with that of a common and continuous main shaft, said cylinders being formed in outwardly-braced shells each shell being separable transversely through its center into two parts each part being adapted to be held in position by an outside case forming part of the middle cylinder and by interior bearings upon and about the main shaft, said cylinders having the form of circular annular rings and being separated by webbed inter-insulating-spaces, said outside case, said main shaft, disks carried by said shaft, one for each cylinder, said disks being furnished with projecting piston-holders, pistons carried by said holders, beveled split packing-rings, 24, 25, concentric with said cylinders, carried by the shells in which said cylinders are formed and adapted to engage the sides of the piston-carrying disks and adapted by their shape to be pressed in against the disks by the pressure of steam from the cylinders, a rotating abutment furnished with parts for the passage of the pistons, and means for conducting the actuating fluid to and away from said cylinders.

6. An engine-casing consisting of a central or main portion 6, furnished with extensions 12, sections 10 and sections 11 adapted to be held peripherally by the extensions 12, and heads 21 adapted to be bolted to the extensions 12; said sections 8, 10 and 11 having formed in them circular annular cylinders, said cylinders being formed one half in one section and the other half in the adjacent section, and said portion 6 having formed in it seats for a rotating abutment and a rotating valve.

7. In combination, an engine-casing and separable shells carrying two or more annular cylinders having their center of generation identical with that of a common and continuous main shaft, said cylinders being placed side by side and being formed one half in one shell and the other half in another shell, said shells being held firmly in place by the casing and two or more of said shells being carried axially inward to form bearings for said main shaft.

8. In a cylinder-casing, in combination, an exterior case containing, firmly held in position upon different planes, sectional braced shells having formed within them annular cylinders whose center of generation is identical with that of the main shaft of the engine, said cylinders being

formed half in one integral section and half in the contiguous section, one or more of said cylinder-carrying sections and the central integral part of the exterior case being confined inward and bored to form bearings for the main shaft.

9. In a rotating-piston engine, in combination, two or more sets of sections carrying annular cylinders placed side by side and concentric with a continuous main shaft, an outside case constructed integrally with the interior cylinders for holding said cylindrical shells, a central main shaft passing from end to end of said case, disks carried by said shaft, pistons carried by said disks, rotating abutments, with parts for the passage of the pistons, adapted to open and close one portion of the annular cylinders with each rotation of the pistons, and furnished at the outer ends with hubs one of which is adapted to carry a gear-wheel and the other to run in a bearing formed in the piston-casing, a fixed shaft or a sleeve upon which said abutment rotates, said gear-wheel upon said hub, a corresponding gear-wheel on the main shaft, and means for the admission and exhaust of steam to and from said cylinders.

10. The combination is a compound rotating engine, of a casing having formed therein annular cylinders generated from the same center, but upon different planes, a main shaft passing axially through said cylinders, disks having radial arms carried by said shaft, pistons carried by said arms, a rotating abutment carried in said casing adapted to engage at one part said disks and furnished with parts for the passage of the pistons, a shaft upon which said abutment rotates—gears carried by said main shaft and said abutment whereby they are caused to rotate synchronously, said abutment being in two parts and adapted to operate in connection with both the high and low pressure cylinders and being furnished upon its ends with hubs one of which is adapted to carry the gear-wheel and the other of which is adapted to run upon a bearing formed within the casing, and means for admitting steam to and for exhausting it from said cylinders.

11. A valve for a rotating engine comprising a stem furnished with an extended portion containing passages for conducting and distributing an actuating fluid, and a double cylindrical seat furnished between its inner and outer limits with passages each of which is furnished with a port adapted to connect with the passages in and through the valve and being themselves adapted to be connected with the inlet and exhaust ports of the engine cylinders; said passages in said extended portion of the valve being adapted, in one position of said stem and valve, to admit the propelling fluid to passages in said seat from whence it passes to the rear of the pistons in the engine-cylinders, and by a partial revolution of said stem and valve to passages in said seat from whence it passes to the front of said pistons.

12. The combination with the annular cylinders, the pistons and the rotating abutments of a compound rotating-piston engine, of a cylindrical valve having its seat and axis through the longitudinal center of the abutment, said seat having, in axial line with each other, an outer cylindrical portion having cut through it a port to admit the actuating fluid to the valve and registering with either of two ports leading to a passage through the valve and an inner portion with cylindrical bearing formed within two cylindrical walls, one separated from and contained within the other, the interspace being divided by partitions into sectional annular passages one of which is shut off from that portion of the seat which is connected with the steam-inlet to the engine and leading to the outer or admission part of the valve-seat, others being connected, separately, by means of passages, to each side of the abutment closing of the annular high-pressure cylinder and onto the exhaust-opening of the engine, said valve being capable of a partial rotation within its seat and having two portions corresponding with the two portions of the seat, namely, an outer portion for reception of the initial actuating fluid connected with an inner or distributing portion containing passages and ports cut in through its body registering with ports cut through the inner cylindrical limits of this portion of the seat which admit the actuating fluid to the said sectional annular distributing-passages to govern the forward movement of said pistons, and in exhaust, or when rotated, to register with the passages which govern the backward movement of said pistons, and in reverse, exhaust.

13. The combination with the cylinders and pistons of a rotating-piston engine, of a cylindrical valve-seat comprising a distributing portion and a cut-off portion in axial line with each other, said distributing portion being formed with sectional annular passages surrounding the seat through which seat ports are cut leading to said passages and to the steam and exhaust ports of the cylinders, a valve comprising a distributing portion and a cut-off portion in axial line with each other, said distributing portion being furnished with passages adapted in one position to register with the ports in said seat leading to those in the cylinder which govern the admission of actuating fluid to cause a forward movement of the pistons and when rotated to register with those governing a reversal of the pistons, and the extended, or cut-off portion, of which is furnished with a port registering with one of two ports in the cut-off portion of the valve both of which lead to a passage through the valve connecting to the distributing-passages, said port in said extended portion of said valve being

connected at the time the piston is passing through the abutment and the steam-ports are open to each other by an internal bearing-piece carried upon the inside of the rotating abutment and said bearing-piece.

14. A valve comprising a stationary part or seat and a rotatable cylindrical part, said stationary part consisting of an annular portion the inner bound of which surrounds and forms the seat for the distributing portion of the cylindrical valve; and which contains, separated by radial walls, passages furnished with ports connected with the distributing-passages through the cylindrical valve, also connected with the inlet and exhaust parts of a cylinder and being furnished at one end with a cylindrical projection or sleeve furnished with a part for the passage of the actuating fluid; the rotatable part of said valve being furnished with a passage through it connecting the distributing-section of said rotatable part and its parts with its inlet and out-off section and parts, said parts being adapted to register, one at a time, in the distributing portion to one of two ports leading to the cylinder of the engine, and in the inlet portion to a port through the inlet sleeve, and said cylindrical rotatable portion being further furnished with passages through the distributing-section adapted to conduct the actuating fluid from the passages leading from the high to the passage leading to the low pressure cylinder and from the low-pressure cylinder through the distributing portion to the exhaust, one position of said rotatable portion with its openings conducting the actuating fluid to the ports to cause a forward movement of the engine and another position to ports to cause a reversal of the movement.

15. The combination with the cylinders and rotating piston of a compound rotating-piston engine, of a cylindrical valve-seat comprising two portions in axial line with one another, namely, an outer portion for admission of steam to the valve and an inner portion with fluid passages and ports connected with a passage leading to the outer portion, a valve constructed in two parts in axial line with one another, that is an outer or out-off portion and an inner or distributing portion, said outer portion being furnished with two ports on different radii and connected with the valve, one of said ports registering with a port through the valve-seat for forward action of the piston and the other port adapted to register with the same port in the valve-seat for reverse action of the piston, said fluid-passages in the inner portion of the valve adapted to register with passages in the inner portion of the seat which leads to and from the cylinder of the engine.

16. The combination with a rotating-piston engine as described, of an abutment-cylinder having an internal hollow cylindrical portion rotating over a sleeve fixed in its axis between which and said hollow abutment is formed an annular steam-chamber having projecting into it from the body of the abutment a bearing-piece running in smooth contact upon the sleeve and adapted to periodically cut off the flow of actuating fluid from a port out through the sleeve to a valve within it during the passage of the piston through the ports in the periphery of the abutment-cylinder, said sleeve and said valve.

17. The combination with a rotating-piston engine as described of cylindrical valves having an outer or out-off portion in axial line and connecting with an inner or distributing portion, the outer portion having two parallel steam-ports connecting with an internal passage adapted to admit and gradually cut off the actuating fluid passing through a port in the valve-seat, one of said ports serving for a passage of the actuating fluid to drive the piston in one direction, the other for a passage of the fluid to drive them in the opposite direction, said internal passage in the valve being connected by an opening or openings to a cut-away portion of the opposing outer surface of the valve whereby a pressure of the actuating fluid against said cut-away portion may be obtained to balance against pressure through the open ports of said valve, and means whereby said valve may be partially rotated upon its axis.

18. The combination with a reversing rotating-piston engine as described, of three-way valves placed in the inlet and exhaust passages of the low-pressure cylinder by the side of the rotating abutment their axis parallel with its axis and near the admission and admission ports of the annular cylinder, axial stems upon said valves projecting beyond the abutment-seat, cranks carried by said stems, an arm or bar one end of which is connected to one crank and the other end of which is connected to the other crank, a cam formed upon the end of the abutment-cylinder or its accompanying gear and rotating with it, and a bell-crank one end of which is attached to said arm or bar and the other end of which is operated by said cam and which is fulcrumed to a fixed point, said parts being so disposed that said valves will cut off the flow of actuating fluid to and from the high-pressure cylinder during the passage of the low-pressure piston through the port in the abutment.

19. A cylindrical valve, arranged for partial rotation upon its own axis, having two portions in axial line with each other, one containing two central ports parallel with the axis and with each other connected with an internal passage through the valve and the other portion with distributing-passages constructed to register radially with ports through the seats of this portion of the valve, one to and one from the high-pressure

cylinder of a compound engine, one to and one from the low-pressure cylinder, and one to the exhaust from the engine, said partial rotation of said valve being adapted, through means of one or other of the two ports cut through the outside or out-off portion coming into registration with a port cut in the valve-seat of this portion, or such registration being changed to complete closing of said seat-part; to control the steam admitted to the engine from full admission to no admission, without disturbing the cycle or reversing the engine, the ports of the distributing portion of the valve being cut wider than those of the out-off portion, then, by continuing the rotation to reverse the position of the steam-passages and ports throughout the valve and consequently reverse the engine, at first without admission of steam through the port in the outer bearing, then inward through least admission to full admission.

697,076. SAND-SCREEN. SAMUEL W. DEW, Milled, Iowa. Filed Nov. 20, 1901. Serial No. 94,099. (No model.)

Claim.—In combination, a frame, legs at opposite ends of the frame, a screen mounted on the frame for transverse reciprocation, hangers supporting the delivery end of the screen and adapted to bear against the upper side of the lower legs, standards pivotally supporting the upper end of the screen, a transverse power-driven shaft mounted upon extensions of the frame, upper and lower bell-crank levers connected for simultaneous oscillation, links connecting corresponding arms of the bell-crank levers with the screen, and gearing between the upper bell-crank lever and the power-driven shaft, substantially as set forth.

697,077. ELECTRO-ARC LAMP. JOHN BUEHNER, Chicago, Ill. Filed Aug. 12, 1901. Serial No. 71,997. (No model.)

Claim.—1. A device for arc-lamps, consisting of a frame carrying a pivoted gripping-dog on one side, and a roller on the opposite side, to

combination with a stationary part, against which said roller bears and which is located between the roller and the opening in the frame, substantially as described.

2. A clutch for arc-lamps, consisting of the combination of a frame provided with tripping-lugs d^1 , a dog e pivoted thereto, a roller f carried by said frame, the standard c against which said roller bears, and a support against which the lugs d^1 are adapted to strike.

697,078. KNITTING-MACHINE. GEORGE E. ELLIS, Philadelphia, Pa. Filed June 21, 1901. Serial No. 66,309. (No model.)

Claim.—1. In a knitting-machine, the combination with the needles and mechanism for operating the same, of projecting fingers or detents adapted to pass between certain needles at certain intervals and hold the thread up while the needle is in advance of it in drawing said thread down thereby forming an enlarged or open mesh between closely-knitted meshes, and mechanism for operating certain detents during the knitting of one course and different detents during the knitting of other courses for the purpose of changing the alignment of the enlarged or open meshes, substantially as described.

2. In a knitting-machine, the combination with the needles and their operating mechanism, of detents arranged between the needles at predetermined points, a cam carried by the revolving head of the machine adjacent to the detents, and mechanism for holding said cam in the path of the detents on one or more revolutions of the head and then automatically releasing the same, for the purpose substantially as described.

3. In a knitting-machine, the combination with the needles and their operating mechanism, of detents arranged between the needles at predetermined points, a cam carried by the revolving head of the machine adjacent to the detents, and mechanism for holding said cam in the path of the detents on one revolution of the head and releasing the same on the next revolution for the purpose substantially as described.

4. The combination with the needles and their operating mechanism, of detents arranged in series between the needles at predetermined points, a series of cams carried by the revolving head of the machine, each of said cams adapted to engage a different series of detents, and mechanism for operating said cams, for the purpose described.

5. The combination with the needles and their operating mechanism, of detents arranged in series between the needles at predetermined points, a series of cams carried by the revolving head of the machine, each of said cams adapted to engage a different series of detents on each revolution of the head, and mechanism for operating said cams alternately, for the purpose described.

6. The combination with the needles and their operating mechanism, of detents arranged in series adapted to pass between needles at predetermined points, a series of cams carried by the revolving head of the machine, each of said cams adapted to engage a different series of detents, and mechanism for throwing the said cams into engagement with the detents upon certain revolutions of the head, for the purpose substantially as described.

7. The combination with the needles and their operating mechanism, of detents arranged in series adapted to pass between needles at predetermined points, a series of cams carried by the revolving head of the machine, each of said cams adapted to engage a different series of detents, and mechanism for throwing the said cams into engagement with the detents alternately upon each revolution of the head, for the purpose substantially as described.

8. The combination with the needles and their operating mechanism, a sinker-bar bed, a series of detents adapted to move radially in said bed

between the needles at certain intervals, a revolving cam-head, a movable carriage supported on said cam-head, a pivoted cam-plate carried by the carriage adjacent to the detents, mechanism for moving the cam-plate in the path of the detents at predetermined times and releasing the same, for the purpose substantially as described.

9. The combination with the needles and their operating mechanism, a sinker-bar bed, a series of detents adapted to move radially in said bed between the needles at certain intervals, a revolving cam-head, a movable carriage supported on said cam-head, a pivoted cam-plate carried by the carriage adjacent to the detents, mechanism for moving the cam-plate in the path of the detents during one revolution of the cam-head and releasing the same during the next revolution, for the purpose substantially as described.

10. The combination with the needles and their operating mechanism, a sinker-bar bed, a revolving cam-head for actuating the sinker-bar, a series of detents arranged between certain needles, a sliding carriage secured on the cam-ring, a pivoted cam-plate carried by the said carriage adjacent to the detents, a toothed wheel mounted on said carriage having its teeth adapted to engage the cam-plate and throw it in the path of the detents, and means for actuating the said toothed wheel so as to release the cam-plate at predetermined times, substantially as described.

11. The combination with the needles and their operating mechanism, a sinker-bar bed, a revolving cam-head for actuating the sinker-bar, a series of detents arranged between certain needles, a sliding carriage secured on the cam-ring, a pivoted cam-plate carried by the said carriage adjacent to the detents, a toothed wheel mounted on said carriage having its teeth adapted to engage the cam-plate and throw it in the path of the detents, and means for actuating the said toothed wheel so as to release the cam-plate on every other revolution of the cam-head, substantially as described.

12. The combination with the needles and their operating mechanism, a cam ring or head for operating the sinker-bar, a sinker-bar bed, a series of detents adapted to pass between certain needles, mechanism for actuating the said detents in advance of the sinker-bar, and means for rendering the detent-actuating mechanism inoperative, for the purpose described.

13. The combination with the needles and their operating mechanism, a cam ring or head for operating the sinker-bar, a sinker-bar bed, a series of detents adapted to pass between certain needles, mechanism for actuating the said detents in advance of the sinker-bar and means for automatically rendering the detent-actuating mechanism inoperative and again operative at predetermined times, for the purpose described.

14. The combination with the needles and their operating mechanism, of radially-disposed detents adapted to pass between certain needles in advance of the web-holder, mechanism for actuating said detents alternately, and means for rendering the detent-actuating mechanism inoperative and operative alternately during each revolution of the cam-head of the machine, for the purpose described.

15. The combination with the needles and their operating mechanism, a sinker-bar bed, a revolving cam-head for operating the sinker-bar, a series of detents arranged at intervals in the sinker-bar bed, a sliding carriage secured to the cam-head, a series of pivoted cam-plates mounted on said carriage adapted to engage certain of the detents, and means for automatically withdrawing the carriage to render the cam mechanism inoperative during a portion of each revolution of the cam-head and resetting the same during the remaining portion of said revolution, for the purpose described.

697,079. METALLIC WHEEL. GEORGE E. ELLIS, Philadelphia, Pa. Filed Apr. 18, 1901. Serial No. 66,378. (No model.)

Claim.—1. The combination of a wheel-felly formed with spoke-openings, said openings being inwardly tapered from their opposite ends, and tubular spokes tapered at their outer ends to fit the inner tapered ends of said openings, the extremities of the tapered spoke ends being flared or expanded to fit the outer tapered portions of said felly-openings, substantially as shown and described.

2. The combination of a wheel-felly formed with spoke-openings, each of said openings being inwardly tapered from opposite ends and having its smallest diameter at or about the center of the felly, tubular spokes tapered at their outer ends and fitting the inner tapered portions of the felly-openings, the extremities of the tapered spoke ends being flared or expanded to fit the outer tapered ends of said felly-openings, and rivets extending transversely through the tapered spoke ends and centrally through the felly, substantially as shown and described.

3. In a wheel, the combination of tubular metallic spokes having tapered inner and outer ends, a hub formed with inwardly-tapering depressions to receive the tapered inner ends of the spokes, and a felly formed with outwardly-tapering openings to receive the outer tapered ends of the spokes, substantially as shown and described.

4. A metallic hub having its bore formed with inwardly-extending shoulders, a wood filler adapted to be driven into the hub-bore and be confined by being impinged by said shoulders, the hub being formed with spoke depressions having inward effects, and spokes fitting the depressions and formed with effects complementary therewith, substantially as shown and described.

5. The combination of a hollow metallic fully, heads secured therein having tapering recesses, and spokes tapered complementarily with and secured in the heads, substantially as shown and described.

6. The combination of a hollow metallic fully, hollow heads secured therein, the head depressions being inwardly tapered from opposite sides of the head, and spokes tapered at the end to fit one portion of said tapered depressions, the extremities of the spokes being flared or expanded to fit the oppositely-tapered portions of said head depressions, substantially as shown and described.

7. The combination of a fully formed with spoke-receiving openings, said openings being inwardly tapered from opposite ends, and tapered spokes adapted to fit the inner tapered portions of said openings, the extremities of the spokes being flared or expanded to fit the outer tapered portions thereof, substantially as shown and described.

8. The combination of a hub formed with spoke depressions having annular effects, tubular spokes tapered at their opposite ends, the inner tapered ends of the spokes being formed with effects complementary with the hub-depression effects which they closely fit, a rim having spoke-receiving openings, said openings being inwardly tapered from opposite ends, the tapered outer ends of the spokes fitting the inner tapered portions of said depressions, and the spoke extremities expanded or flared to fit the outer tapered portions of the openings, substantially as shown and described.

697,080. GAS-LIGHTING APPARATUS. CARLOS FARRER, London, Germany. Filed Apr. 2, 1901. Serial No. 54,197. (No model.)

Claim.—1. The combination with a gas-burner, a gas-supply pipe, a cut-off valve interposed between said burner and pipe and means operated by increase of the gas-pressure in the supply-pipe to move the valve off its seat; of means operated inversely to the direction of flow of gas from the supply-pipe to decrease the volume of gas supplied to the burner, substantially as and for the purpose set forth.

2. The combination with a gas-burner, of a gas-supply pipe, a gas inlet and cut-off valve interposed between said pipe and burner and means operated by variations of the pressure to move said valve to and off its seat; of a regulating-valve moved inversely to the direction of flow of gas from the supply-pipe to decrease the volume of gas supplied to the burner, substantially as and for the purpose set forth.

3. The combination with a gas-burner, a gas-supply pipe, a gas inlet and cut-off valve interposed between said burner and pipe and means operated by variations of the pressure in the supply-pipe to move said valve to and off its seat; of a regulating-valve moved by the cut-off valve inversely to the direction of the flow of gas from the supply-pipe for de-

creasing the volume of gas supplied to the burner, substantially as and for the purpose set forth.

4. The combination with a gas-burner, a gas-supply pipe, a cut-off valve interposed between said burner and pipe, and a float connected to said valve and moved by the displacement of a liquid under the pressure of the gas from said supply-pipe; of a regulating-valve also moved by said float and operating to regulate the volume of gas supplied to the burner in accordance with the variations of the pressure of the gas on said liquid, for the purpose set forth.

5. The combination with a gas-burner, an igniter-burner, and a gas-supply pipe in communication with both burners; of a float-controlled cut-off valve for each of said burners, said floats moved by the displacement of the level of a liquid by variations of the pressure thereon of the gas from the supply-pipe, for the purpose set forth.

6. The combination with a gas-burner, an igniter-burner, and a gas-supply pipe in communication with both burners; of a float-controlled cut-off valve for each of said burners, said floats moved by the displacement of the level of a liquid by variations of the pressure thereon of the gas from the supply-pipe, and means for imparting a differential movement to said floats, for the purpose set forth.

7. In an automatic gas-lighting apparatus, the combination with a casing divided into concentric chambers, the inner chamber open at its lower end, the outer chamber in communication with the atmosphere at its upper end, a sealing liquid in said chambers the normal level of which is below said communication, a gas-supply pipe extending into the inner chamber above said normal level, a main burner and an igniter-burner both in communication with said inner chamber above the said normal level of the sealing liquid; of a float-controlled cut-off valve for each of said burners, and means for imparting to the floats a differential movement when the level of the sealing liquid drops below a normal level under an increase of the pressure in the inner chamber, for the purpose set forth.

8. In an automatic gas-lighting apparatus, the combination with a casing divided into concentric chambers, the inner chamber open at its lower end, the outer chamber in communication with the atmosphere at its upper end, a sealing liquid in said chambers the normal level of which is below said communication, a gas-supply pipe extending into the inner chamber above said normal level, a main burner and an igniter-burner both in communication with said inner chamber above the said normal level of the sealing liquid; of a float-controlled cut-off valve for each of said burners, and means for imparting to the floats a differential movement when the level of the sealing liquid drops below a normal level under an increase of the pressure in the inner chamber and when said level again rises to its normal level under a decrease of said pressure, for the purpose set forth.

9. In an automatic gas-lighting apparatus, the combination with a casing divided into two concentric chambers, the inner chamber open at its lower end, the outer chamber in communication with the atmosphere at its upper end, a sealing liquid in said chambers the normal level of which is below said communication, a gas-supply pipe extending into the inner chamber above said normal level, a main burner, and an igniter-burner

provided with a platinum-sponge igniter; of a float-controlled valve for each of said burners, means for limiting the movements of the floats in either direction and means for imparting to them a differential movement when the level of the liquid sinks below or returns to its normal level under variations of gas-pressure, for the purpose set forth.

10. In an automatic gas-lighting apparatus, the combination with a casing divided into two concentric chambers, the inner chamber open at its lower end, the outer chamber in communication with the atmosphere at its upper end, a sealing liquid in said chambers the normal level of which is below said communication, a gas-supply pipe extending into the inner chamber above said normal level, a main burner, and an igniter-burner provided with a platinum-sponge igniter; of a float-controlled valve for each of said burners, the float for the igniter-burner cut-off valve being immersed to a greater extent in the sealing liquid than the float for the main-burner valve, for the purpose set forth.

11. In an automatic gas-lighting apparatus, the combination with a casing divided into two concentric chambers, the inner chamber open at its lower end and the outer chamber in communication with the atmosphere at its upper end, a sealing liquid in said chambers the normal level of which is below said communication, a gas-supply pipe extending into the inner chamber above said normal level, a main burner and an igniter-burner both in communication with said inner chamber above the level of the liquid therein; of a double-cone float-controlled valve, controlling the inlet and outlet of the passage leading from the inner chamber to the main burner, a float-controlled cut-off valve for the igniter-burner, and means for imparting a differential movement to the floats when the level of the liquid falls below or returns to its normal level under variations of the pressure in the inner chamber, for the purpose set forth.

697,081. PARALLEL RAILWAY-RAIL BEARING. HANLEY I. GILBERT, Wethers, Kans. Filed Jan. 9, 1902. Serial No. 86,969. (No model.)

Claim.—1. The combination with a railway-rail, of a convex metal bearing, a rail-seat cast or rolled at the apex of said bearing and provided with orifices and slots forming connection with the inner ends of said orifices at their tops, the rail-seat shoulder adapted to clamp the outer flange of the rail and the bolts adapted to operate in said orifices and provided with nuts and threaded at their outer ends and having their inner ends bent to operate through the orifice-slots and clamp the inner rail-flange, the depressions in said bearings between the bolts to drain off water, the straps adapted to clamp the outer flanges of the rail-bearings, the rods having their lower ends adapted to form connection with the inner ends of said straps and clamp over the inner rail-bearing flanges, the turnbuckles to connect said rods and regulate the gage, and the plates provided with perforations to connect the rail-bearings, substantially as described and for the purpose specified.

2. The combination with two lines of convex railway-bearings set parallel, of metal straps set transversely underneath said bearings the outer ends being turned backward to clamp the outer flanges of the bearings, of a turnbuckle, of the rods whose inner ends make connection with said turnbuckle and whose outer ends are adapted to be rigidly fastened on the inner ends of said straps with extended upwardly-raised projections adapted to clamp over the inner flanges of the rail-bearings, substantially as described and for the purpose specified.

3. In a railway two parallel lines of rail-bearings and the seats thereon adapted to seat and clamp two parallel rails of a track, the flanges at the bases of said bearings, the turnbuckles, the metal straps set transversely underneath said bearings provided with turned ends to clamp the outer flanges of the bearings and the rods forming connection between said turnbuckles and straps and clamping down the inner flanges of the bearings, substantially as set forth.

4. The combination with convex railway-bearings adapted to be set parallel, of rail-seats set at the apex of said convexity and provided with orifices, bolts and shoulders with grooves for retaining the rails upon their seats, and transverse depressions in said bearings placed alternately with said bolts to drain the water off the track, substantially as described.

697,082. OIL-CUP. JAMES H. W. HANSEN, Hartford, Conn., assignor to the Winkley Company, Hartford, Conn., a Corporation of Connecticut. Filed June 15, 1901. Serial No. 84,987. (No model.)

Claim.—1. An oil-cup comprising a body portion having an annular outwardly-extending internally-supported cover, and a telescoping thimble mounted on the body below the cover to close against the cover.

2. A self-closing oil-cup, comprising a body portion having an annular outwardly-extending internally-supported cover, a telescoping thimble mounted on the body below the cover, to close against the cover, and a spring for resiliently holding the thimble to its cup-closing position.

3. In an oil-cup, the combination of an oil-receiving body, provided with an upwardly-extending stem having an annularly-extending head, forming a cover for the cup, and a telescoping thimble mounted upon the body to close against the cover.

4. A self-closing oil-cup, comprising an oil-receiving body portion, a cover comprising an annular head attached to the body by a reduced stem, a telescoping thimble mounted upon the body to close against the head, and a spring for resiliently holding the thimble in its closed position.

5. An oil-cup comprising an oil-receiving body portion, provided with an internally-supported annularly-extending head forming a cover for the cup, and a telescoping thimble mounted upon the body below the cover, having an annular shoulder forming a step for the opening movement of the thimble.

6. A self-closing oil-cup, comprising an oil-receiving body portion, having an internally-supported annularly-extending head forming a cover for the cup, a telescoping thimble mounted upon the body, provided with a shoulder extending annularly over the wall of the body of the cup, to form a step for the downward movement of the thimble, and to form a shoulder for a spring, and a spring for engaging with the said shoulder to resiliently hold the thimble in its cup-closing position.

7. The combination, in an oil-cup, of an internally-supported annular cover therefor, and a thimble resiliently closing against the cover, with a flaring joint to be wedged open by the nose of an oil-can.

8. The combination, in an oil-cup, of an annular cover, secured to the body of the cup by a reduced stem, a thimble closing against the cover and encircling the stem with an annular outwardly-flaring opening, for receiving the oil.

697,088. COLLAPSEABLE CORR-BAR. JOSEPH D. HANSEN, Birmingham, Ala. Filed Dec. 7, 1901. Serial No. 85,090. (No model.)

Claim.—1. In a corr-bar, the combination of a plurality of channelled castings forming the body of the bar, a radially-movable plate in each casting, levers pivotedly connected at adjacent points to both castings and plates, and means for shifting said levers, substantially as described.

2. In a corr-bar, the combination of the body, a series of radially-movable plates thereof, levers, interposed between the several plates and body, pivotedly connected both to the plates and body, and movable oppositely-acting cams engaging opposite ends of the levers, substantially as described.

3. In a corr-bar the combination of the body, the annular series of

radially-movable plates thereon, levers interposed between the plates and body and pivotally connected with both plates and body at adjacent points, movable oppositely-facing cams engaging opposite ends of the levers, and means for simultaneously shifting said cams, for the purpose and substantially as described.

4. In a core-bar the combination of an annular series of channelled castings forming the surface of the bar, a radially-movable plate in each casting forming the body of the bar, and cams and connections for simultaneously adjusting said movable plates, substantially as described.

5. In a core-bar the combination of an annular series of channelled castings forming the surface of the bar, a radially-movable plate in each casting, levers interposed between the plates and castings and pivotally connected to both at adjacent points, oppositely-facing cams engaging opposite ends of the levers, and means for simultaneously shifting said cams, substantially as described.

6. In a core-bar the combination of the body, a series of radially-movable plates on the exterior thereof and connected therewith, oppositely-disposed cams between the body and plates, levers pivoted to the plates and body and adapted to engage the opposite ends of the plates, and means for shifting the cams, substantially as described.

7. In a core-bar the combination of longitudinally-channelled castings, a radially-movable plate in each casting, and levers pivotally connected to the plates and castings; with longitudinally-movable cam-bars between the plates and castings having oppositely-facing cams engaging opposite ends of the levers, substantially as described.

8. In a core-bar the combination of an annular series of longitudinally-channelled castings, the radially-movable plates in said castings, and levers pivotally connected to the plates and castings; with longitudinally-movable oppositely-facing cams engaging opposite ends of the levers, and means for simultaneously shifting said cams, substantially as described.

9. In a core-bar the combination of the support, the annular series of externally-channelled castings attached thereto, the radially-movable plates fitted in said castings, the levers pivoted to the plates and castings, and pairs of oppositely-facing cams engaging the opposite ends of the levers; with cam-bars connecting and operating said cams, and the cap to which said cam-bars are attached, substantially as described.

10. In a core-bar the combination of the support, the series of longitudinally-channelled castings attached thereto, the radially-movable plates in said castings, and levers pivotally connected to the plates and castings at adjacent points; with longitudinally-movable cam-bars between the plates and castings, oppositely-facing cams on said bars engaging opposite ends of the levers, and means for simultaneously shifting said cam-bars, substantially as and for the purpose described.

11. In a core-bar the combination of the support, the annular series of channelled castings attached thereto, the radially-movable plates fitted in said castings, the levers pivoted to the inner sides of the plates and also pivoted to lugs on the castings, and pairs of oppositely-facing cams engaging the opposite ends of the levers; with cam-bars connecting and operating said cams, a movable cap on one end of the core to which said cam-bars are attached and whereby they may be simultaneously shifted, and eyebolts attached to said cap-piece, all substantially as and for the purpose set forth.

697,084. HYDRANT. WILLIAM HENDERSON, Los Angeles, Cal.
Filed Aug. 24, 1901. Serial No. 73,135. (No model.)

Claim.—In an irrigating-hydrant, a nozzle therefor composed of two circular chambers, disposed one above the other; the upper chamber having a centrally-disposed circular opening with sharp edges in the top thereof; and the lower chamber having a centrally-disposed circular threaded opening in the bottom thereof; an oblique passage connecting said two chambers, commencing at one side of the opening in the lower chamber, in combination with a stand-pipe, adapted to be screwed into the lower chamber to contact with the web separating the two chambers.

697,085. SMOKE-PREVENTER. JOHN E. HENARE, Denver, Colo.
Filed July 3, 1901. Serial No. 67,931. (No model.)

Claim.—1. The combination with a boiler, the fire-box thereof and a bridge-wall at the rear of the fire-box, of an arch fitted above the bridge-wall having an internal chamber, connections made between said chamber and the heat-passages below the arch, means for supplying air into the chamber within the arch, a second arch located at the rear of the bridge-wall having pycnoleth through, and a heating-chamber formed above said passages, with connections from the chambers into the passages, and means for supplying air into said chamber.

2. The combination in a boiler, the fire-box bridge-wall and rear combustion-chamber thereof, of a plurality of arches located beneath the boiler, one in rear of the other, a passage for the products of combustion between the bridge-wall and the first arch, a heating-chamber in the upper part of said arch and means for supplying air thereto, passages leading downwardly from said chamber, discharging air to mingle with the products of combustion in the space beneath the arch, a plurality of openings through the rearward arch with corresponding heating-chambers above each series, air-supply passages connecting with said heating-chambers and passages delivering air from the chambers into the heat-passages below.

3. A boiler-furnace including a plurality of bridge-walls located at different distances from the fire-box, an arch above each of said walls and forming between itself and the wall a passage for products of combustion, heating-chambers formed in the upper portions of the arches and passages leading from said chambers and discharging air to mingle with the products of combustion, and separate air-inlet passages connecting through openings in the rear walls of the arches.

4. A boiler-furnace including a grate, a rear combustion-chamber, a plurality of walls between said grate and chamber, an arch above each wall and forming between itself and the wall a passage for the products of combustion, one of said walls having contracted openings through it, heating chambers in the upper portions of the arches and passages leading from the chambers and discharging air into the smoke-passages to mingle with the products of combustion, and air-pipes having ends captured and located back of each wall and communicating with the heating-chambers therein.

5. A boiler-furnace having a grate, and a rear combustion-chamber, transverse walls between the grate and the rear end, arches above the walls and separated therefrom to form a passage for products of combustion, air-chambers within the arches and branches communicating with the passages through, pipes extending along the inner side walls of the rear chamber, and upward at the rear of the transverse walls, said pipes having connections with each of the air-chambers.

697,086. AUTOMATIC WATER-BALANCE. ALBERT HENARE, Escondido, Mexico. Filed Apr. 20, 1902. Serial No. 13,003. (No model.)

Claim.—The herein-described means to regulate the level of water in a trough, or receptacle, comprising the trough A, having connection

with the chamber C; the cylindrical chamber C, adapted to receive the cylindrical float B; the float B carrying rod G pivoted thereto, and pivotally connected to the lever E; the lever E, being pivotally mounted on the upright F, forming a fulcrum therefor, one end pivoted to the rod G, and means, substantially as shown, to regulate the elevation of said connection with said rod, and the other end pivoted to the rod J; the rod J, pivoted to the valve-lever K of the valve H; the valve H arranged to be opened and closed by the means shown and described; and the pipe D for carrying the fluid, substantially as shown and described.

697,087. WIRE BED-BOTTOM. JOHN HORT, San Francisco, Cal.
Filed May 17, 1901. Serial No. 69,067. (No model.)

Claim.—1. The combination in a bed-bottom of a rigid rectangular frame, two superposed elastic fabric, stretched between said frame and one of said fabric serving as a reinforce for the other, and a continuous yielding pad or mattress parallel with and interposed between the entire inner surfaces of the two fabric, and adapted to gradually transmit the pressure of the upper fabric to the lower one.

2. The combination in a bed-bottom, of a rigid rectangular frame composed of side and end bars, parallel elastic fabric stretched upon opposite sides of the frame as to leave a clear uninterrupted space between the fabric, one of said fabric having a different degree of flexibility than the other and serving as a reinforce for the latter, and as a means for counterbalancing the strain of the other fabric upon the end bars of the frame, and a pad extending parallel with the fabric and through the space between them, and adapted to gradually transmit to the lower fabric, substantially throughout its length, the pressure of the upper fabric.

697,088. SELF-FEEDER FOR THRUSHERS. HATHARD I. HOWE,
Stockton, Cal. Filed Dec. 26, 1900. Serial No. 41,114. (No model.)

Claim.—In a feeder of the class described, the combination with the casing, and the threshing-cylinder of a threshing-machine; of a draper arranged to receive grain and convey it to the cylinder, a transverse shaft 21 journaled in the casing, and disposed above the cylinder, and the pendant draper for regulating the feed of grain to the cylinder; the said draper comprising sprockets 16 on the shaft 21, side bars 18 having slots 19 receiving said shaft 21 whereby they are enabled to swing and move in the direction of their length on the same, a roller 17 journaled in the lower portion of the bars 18, chains passed around the sprockets 16 and roller 17, and means on said chains for engaging the grain.

697,088.

697,089. PRINTING-MACHINE. EDWIN J. JONES, Hensley, Ger.
Filed May 7, 1902. Serial No. 15,809. (No model.)

Claim.—1. In a printing-machine, the combination with a hollow cylinder having interiorly-threaded ends, of screw-plugs threaded in said ends, a bow, and journals mounted in bearings therein and threaded into the outer ends of the screw-plugs, substantially as described.

2. In a printing-machine, the combination with a hollow cylinder having interiorly-threaded ends, of screw-plugs threaded in said ends and having threaded openings to receive journals, said screw-plugs being also provided with disk-heads, and a design-roll held in place between said heads, substantially as described.

3. In a printing-machine, the combination with a hollow cylinder, of screw-plugs threaded in the ends thereof, journals threaded in said plugs, a bow having bearings for said journals, and projections radially dotted, and screws passing through the reservoir-shell and into the radial slots, substantially as described.

4. In a printing-machine, the combination with the design-roll and its supports, comprising disks *d'* and *d''* with the space between them, of the guide-roll comprising parts *a* and *a'* with slot *a'* between them, the steel sheet *a'* with wards *a'*, and the part provided with groove *g*, substantially as described.

697,090. THRESHOLD-GAGE. EDWIN O. KIM, Lawrence, Mass.
Filed Jan. 2, 1902. Serial No. 22,455. (No model.)

Claim.—1. A threshold-gage comprising an adjustable gage-body, jamb-face gages having pivotal connection therewith, rabbit-gages adapted for lateral and longitudinal adjustment with relation to the jamb-face gages, and jamb-side gages connected for lateral and longitudinal adjustment with two of the rabbit-gages.

2. A threshold-gage comprising a two-membered gage-body, each member being provided with a pair of lugs to interlock with the other member, and with a jamb-screw for holding the members at the desired adjustment, jamb-face gages pivotally connected with the gage-body, graduated rabbit-gages connected with the terminals of the jamb-face gages, and adapted for longitudinal and transverse adjustment with relation thereto, laterally and longitudinally adjustable jamb-side gages con-

ried by two of the rubber-gages, and legs or steps carried by the terminals of the jamb-flare gages.

697,091. STOVE. WILSON & P. KENTON, Burbank, Ohio. Filed June 14, 1901. Serial No. 64,000. (No model.)

Claim.—1. In a stove, a top, an annular pan-shaped smoke-chamber immediately below said top, a direct flue-opening in said chamber provided with a damper, an indirect flue-opening in said chamber opposite the first-named opening, a member J forming a passage to the indirect flue-opening, said chamber forming with the stove-top an annular flue, and having the center of the stove-top exposed directly to the heat of combustion.

2. In a combined cooking and baking stove, a top, an annular pan-shaped smoke-chamber immediately below said top, a direct flue-opening in said chamber provided with a damper, an indirect flue-opening in said chamber opposite the first-named opening, a member J forming a passage to the indirect flue-opening, said chamber forming with the stove-top an annular flue and having the center of the stove-top exposed directly to the heat of combustion, a casing connected to the exit-flue of the stove, an oven in said casing, and a smoke-pipe leading from the casing, whereby the greater part of the heat may be directed to the stove-top for cooking, or to the oven for baking.

697,092. ACCOUNT-FILE. Leo J. Kason, Grand Junction, Colo. Filed Apr. 12, 1901. Serial No. 64,000. (No model.)

Claim.—In an account-file, two covers bound together by an elastic fabric, said fabric forming also a back for the file, and a pair of telescoping pins mounted near the opposite edges of said fabric and adjacent to the covers.

697,093. VAPORIZER, MIXER, AND REGULATOR FOR OIL-BURNERS. GEORGE H. LARKIN, San Francisco, Cal. Filed July 26, 1901. Serial No. 70,900. (No model.)

Claim.—1. A hydrocarbon vaporizer and mixer, consisting of a chamber having tortuous passages formed therein, a discharge tube and jet connecting with one end of the passage, a valve disposed within the other end, said chamber having independent oil and steam inlet passages opening against the side of the valve, and said valve having a threaded portion intermediate of the oil and steam passages and a port opening into the interior coincident with the oil-inlet passage, an annular chamber exterior to the valve into which the steam is delivered, and a seat against which the front end of the valve is slidable.

2. A hydrocarbon vaporizing and mixing apparatus, consisting of a chamber having a tortuous passage therethrough with a discharge at one end, parallel steam and oil inlet pipes opening into the side of a valve-chamber and transverse to its axis, a hollow valve turnable in said chamber to advance or retreat, and having a lateral port opening into the hollow interior of the valve in line with the oil-inlet pipe, an annular chamber surrounding the valve into which the steam-pipe opens, a seat interposed between said chamber and the annular steam-discharge by which the flow is regulated.

3. In a hydrocarbon-oil vaporizer and mixer a vaporizing and mixing chamber, a valve-chamber located in one side thereof, oil and steam inlet pipes opening into the side of said chamber, screw-threads formed in said valve-chamber between the inlet-passages, said chamber having a smooth surface portion between the screw-threads and the oil-inlet pipe, a valve having corresponding threads fitting and turnable in said threaded portion, a stuffing-box at one end of the valve-chamber, a stem connected with the valve passing through said stuffing-box having a means at its outer end by which the valve is turnable, said valve having a port opening to the interior coincident with the oil-inlet, an annular chamber surrounding the valve opposite the steam-inlet and separated from the oil-inlet by the screw-threaded portion of the valve, and a seat against which the end of the valve is slidable simultaneously with the port being occluded by the said smooth surface portion of the chamber.

4. A hydrocarbon-oil vaporizing and mixing chamber, a valve-chamber having annular interior grooves, oil and steam inlet pipes opening into the valve-chamber at right angles with its axis and coincident with the grooves, a hollow cylindrical valve screw-threaded and turnable in corresponding threads between the oil and steam pipes whereby the latter are separated and the valve is opened or closed, a conical seat near the discharge end of the valve-chamber, a corresponding cone upon the valve cleasable against said seat, a cylindrical extension beyond the seat of smaller diameter and a corresponding cylindrical extension of the valve, and a chamber surrounding the valve in rear of said seat and connecting with the annular space around the front of the valve, said valve having a port opening into the interior of the valve in line with the oil-inlet and said valve-chamber having a portion intermediate of the inlet-pipes which occludes the port in unison with the seating of the valve.

5. A hydrocarbon vaporizing and mixing chamber, a valve-chamber with oil and steam inlet pipes opening into one side thereof, said chamber having annular interior grooves coincident with said inlet-pipes, a hollow valve screw-threaded and fitting corresponding threads between the inlet-pipes, said valve having a port opening to the interior coincident with the oil-inlet pipe, and said chamber having an annular chamber surrounding the valve in line with the steam-inlet, a conical seat and means for adjusting it within the discharge end of the valve-chamber, a cone on the valve cleasable against said seat, and a cylindrical extension of the seat and the valve in front of the seat, with an annular space for the discharge of steam between the two.

6. The combination of a hydrocarbon-oil vaporizing and mixing chamber, a cylindrical valve-chamber having oil and steam inlet passages opening into the side thereof and annular interior grooves coincident with said passages, an interior cylindrical sleeve fitting said chamber having openings corresponding with the grooves and the steam and oil inlet passages, screw-threads interior to the sleeve located between the oil and steam inlets, a hollow cylindrical valve having screw-threads to fit those of the case and means by which it may be rotated to advance or recede, said valve having a port opening into it in line with the oil-inlet, said sleeve having a chamber surrounding the valve in line with the steam-inlet, an independent seat, means for adjusting it in the discharge end of the sleeve, and a corresponding formation of the valve cleasable against the seat, said sleeve having an annular steam-discharge passage exterior to the seat and surrounding the oil-discharge in the end of the valve.

687,094. MACHINE FOR GRINDING CALENDER-ROLLS
JOSEPH LUTON, Manchester, Va. Filed Dec. 18, 1901. Serial No. 26,410
(No model.)

Claim.—1. In a machine of the class described, the combination of a shaft adapted to be adjustably mounted on the frame carrying the calender-rolls, a grinding-wheel on and adapted to travel from end to end of said shaft, a shaft provided with a screw-thread, a sleeve carried by said screw-threaded shaft, pulleys carried by said sleeve, and means for rotating said screw-threaded shaft in either direction and for rotating said sleeve-pulleys and said grinding-wheel.

2. In a machine of the class described, the combination of a shaft adapted to be adjustably mounted on the frame carrying the calender-rolls, a grinding-wheel on and adapted to travel from end to end of said shaft, a shaft provided with a screw-thread, a sleeve carried by said screw-

threaded shaft, pulleys carried by said sleeve, a shaft carrying a drum and pulleys, loose pulleys on the end of the screw-threaded shaft, bolts connecting said drum and said sleeve-pulleys and said drum-pulleys and said grinding-wheel and said drum-shaft pulleys and said loose pulleys, and means for making one of said loose pulleys fast.

3. In a machine of the class described, the combination of a shaft adapted to be adjustably mounted upon the frame carrying the calender-rolls, a grinding-wheel on and adapted to travel from end to end of said shaft, a shaft provided with a screw-thread and with loose pulleys, a clutch between the loose pulleys adapted to make one of such pulleys fast, a sleeve carried by said screw-threaded shaft, pulleys carried by said sleeve, and means for driving said screw-threaded shaft, the pulleys carried by the sleeve and grinding-wheel.

687,095. FEEDER FOR THRUSHING-MACHINES. THOMAS E. MARGREY, Fairport, Kans. Filed Apr. 27, 1901. Serial No. 27,508.
(No model.)

Claim.—In a feeder for thrashing-machines, the combination with a hopper, of a feeder-conveyor leading therefrom, a conveyor in the bottom of the said hopper discharging into said feeder-conveyor, auxiliary conveyors on the sides of said feeder-conveyor, and at an angle thereto, and a governor mechanism disposed above said feeder-conveyor and between said auxiliary conveyors, substantially as described.

687,096. GOVERNOR MECHANISM FOR THRUSHING-MACHINES. THOMAS E. MARGREY, Fairport, Kans. Filed May 21, 1901. Serial No. 27,505. (No model.)

Claim.—1. In a thrashing-machine feeder of the class described, the combination of a hopper, an inclined endless traveling feeder-conveyor disposed therein and extending outwardly therefrom, and a plurality of take-back mechanisms, operative above said feeder-conveyor, disposed one in advance of the other and supported at different elevations, the one nearer the discharge of the feeder-conveyor being lower and closer to said feeder-conveyor than the other, for the purpose set forth, substantially as described.

2. In combination with a thrashing-machine feeder having a hopper and an inclined endless traveling feeder-conveyor, a reversible shaft *d* having a series of cranks, take-fingers *g* pivotally connected respectively to the said cranks, link *h*, connecting the said take-fingers to a fixed point, a crank-shaft *f* having a series of cranks and disposed in rear of and at a higher plane than the crank *d*, take-fingers *i* pivotally connected respectively to the cranks of said shaft *f*, link *h*, connecting said take-fingers *i* to a fixed point and means to communicate power to said shaft *d*, *f*, substantially as described.

697,096.

697,097. AUTOMATIC VALVE FOR STEAM FIRE-ENGINE.
By ALVARADO MAYER, Detroit, Mich. Filed Nov. 29, 1901. Serial
No. 52,962. (No model.)

Claim.—1. A valve embodying a valve-case provided with a waterway therethrough having in combination therewith a valve opened by water-pressure acting above said waterway, an aperture leading through said valve to admit water-pressure thereupon to seat the valve, a stem within the case provided with a channel-opening through both ends thereof, an oscillatory spring closing device upon said stem actuated in one direction by water-pressure to open and close communication through said stem.

2. A valve embodying a valve-case provided with a lower and with an upper chamber communicating the one with the other a valve in the upper chamber controlling said communication, an aperture leading from the upper chamber, a stem in the lower chamber provided with a channel-opening through both ends thereof, a channel leading through said valve, to admit water upon the top of the valve, an oscillatory device upon said stem actuated by water-pressure to close communication through said stem, and means to return said wing to normal position and open communication through said stem.

3. A valve embodying a valve-case provided with a waterway therethrough having in combination therewith a valve opened by water-pressure acting above said waterway an aperture leading from the case above the valve-case, an aperture leading through said valve, a channel-stem and an oscillatory wing provided with a hub upon said stem, said stem provided with a diaphragm intermediate of the extremities of the channel therewithin, crilless above and below said diaphragm communicating with

the channel and leading through the side of the stem, the hub of the wing provided with a chamber to register with said crilless in the stem when the wing is in closed position and to cut off the communication of said channels when the wing is in open position.

4. In combination a valve-case provided with a waterway therethrough and with an aperture above the waterway, a relief-valve actuated by water-pressure to control communication of said waterway through said aperture, means to admit water-pressure above said valve, a stem provided with a waste-channel to carry off the water from above the valve, and an oscillatory self-closing wing provided with a hub upon said stem to control the passage of water through said channel, said wing actuated by water-pressure to close said channel.

5. In combination a valve-case provided with a waterway therethrough and with an aperture above the waterway, a relief-valve actuated by water-pressure to control communication of said waterway through said aperture, means to admit water-pressure above said valve, a stem provided with a waste-channel to carry off the water from above the valve, and an oscillatory self-closing wing provided with a hub upon said stem to control the passage of water through said channel, said wing actuated by water-pressure to close said channel, said wing arranged to swing by water-pressure out of normal position and into position behind said stem.

697,098. COMPUTING-SCALE. FRED E. HARTMAN, Portland, Oha. Filed Oct. 12, 1901. Serial No. 71,507. (No model.)

Claim.—1. In a computing-scale the combination of a knob, rod two pinions G G two racks F F a frame H rack L pinion M for the purpose specified substantially as described.

2. In a price-scale, in combination, a spring-balance, a disk rotated thereby, said disk having a circular scale of weight-marks and a series of scales of price-marks, an indicator adjustable to a desired scale of said series, means to adjust the disk to allow for tare, and a scale to indicate the amount of such tare.

3. In a price-scale, the combination with a balance, a disk rotated thereby, said disk having scales of weight and price-marks thereon, and indicators for said scales, of means to reverse the motion of the disk to allow for tare, and a supplementary scale and index actuated by said reversing means to indicate the tare.

697,099. PUMP FOR VEHICLES. RALPH L. MORRIS, Toledo, Ohio, assignor to American Hydraulic Company, Jersey City, N. J., and New York, N. Y., a Corporation of New Jersey. Filed Jan. 16, 1902. Serial No. 89,396. (No model.)

Claim.—1. The combination of a steering-post provided with a pump-barrel, a pump-piston therein, a steering-handle for actuating said steering-

ing-post and pump-piston, and stationary valve-controlled inlet and outlet pipes communicating with said pump-barrel, substantially as described.

2. The combination of a steering-post provided with a pump-barrel, a pump-piston therein, a steering-handle for actuating said steering-post and pump-piston, a stationary casing provided with a chamber communicating with the pump-barrel, and valve-controlled inlet and outlet pipes communicating with said chamber.

3. The combination of a steering-post provided with a pump-barrel, a pump-piston therein, a steering-handle for actuating said steering-post and pump-piston, a stationary casing provided with a chamber communicating with the pump-barrel, an inlet-pipe and an outlet-pipe communicating with said chamber, a valve in each of said pipes, and means for normally closing each of said valves, substantially as described.

4. The combination of a rotatable steering-post provided with a pump-barrel, a pump-piston therein, a steering-handle for actuating said steering-post and pump-piston, a stationary casing for the steering-post having valve-controlled inlet and outlet pipes therein, and means for maintaining communication between said pipes when the steering-post is rotated, substantially as described.

697,100. MECHANICAL MOVEMENT. FRANK McKEN, Lemota, Tex. Filed July 2, 1901. Serial No. 96,023. (No model.)

Claim.—1. A mechanical movement or power, consisting of a rotatable retaining-block, a crank on said block, means for rotating said block and with it said crank, an arm in successive engagement with portions of said crank by which the former is moved in one direction, and said arm adapted to move in an opposite direction at its disengagements from said portions of said crank; said parts being combined substantially as described.

2. A mechanical movement or power consisting of a retaining-block suitably journaled, a crank mounted on said block and provided with offsets, means for rotating said block and thereby said crank, an arm having a roller adapted to be engaged successively in each of said offsets during the rotation of said crank, thereby moving said arm in one direction, and said arm adapted to move in the opposite direction on the successive disengagements of said roller from said offsets; said parts being combined substantially as described.

3. In a mechanical movement, the combination of a shaft with a retaining-block secured thereto, a crank on said block rotatable therewith and provided with offsets, an arm having an end successively engaging said offsets during the rotation of said crank thereby moving said arm in one direction, and means adapted to be operated for disengaging the arm from the offsets and moving the same in the opposite direction; said parts being combined, substantially as described.

4. In a mechanical movement, the combination of a retaining-block with a crank loosely mounted thereon, means for rotating said block and thereby said crank, an arm with a roller adapted to be successively engaged by and be retained in offsets in said crank thereby moving said arm in one direction, and means including a flexible cord engaging the said arm for moving it in the opposite direction; said parts being combined substantially as described.

5. In a mechanical movement, the combination of a retaining-block and shaft suitably journaled, a crank loosely mounted on said block to rotate said shaft, and provided with offsets, an arm having a roller at one

end adapted to successively engage in said offsets on the rotation of said crank thereby moving said arm in one direction, a flexible cord having one end passing over a support and adapted for carrying a weight, and its other end secured to a fixed point, and a pulley secured to said arm and bearing on said cord; said parts being combined substantially as described.

6. In a mechanical movement the combination of standards with a retaining-block journaled thereon, means for rotating said block, a crank loosely secured on said block so as to be engaged thereby and rotated therewith, said crank having at regular intervals offsets therein, an arm having at one end a roller adapted to be successively engaged in said offsets and carrying at its other end a pulley, and a flexible cord having one end passing over a support and adapted for carrying a weight, and at its other end fastened to a fixed point, said pulley on said arm bearing on said cord between the supports of the latter, substantially as described.

7. A mechanical movement having a rotatable crank, an arm successively engaged at different portions of said crank to which is imparted a movement in one direction and said arm adapted to move in the opposite direction at its disengagements from said portions of the crank; said parts being combined substantially as described.

697,101. RAIL-SUPPORT. GEORGE H. GATMAN, McKeesport, Pa. Filed Oct. 12, 1901. Serial No. 79,396. (No model.)

Claim.—In a rail-joint, the combination with the rails, a base-plate formed of two sections, one of said sections having formed therein slots and guideways, on the under face thereof, and the other section carrying an integral fish-plate forming a chair portion, bolts and nuts secured in said locking fish-plates sliding in said slots and guideways, all parts being arranged and operating substantially as described.

697,102. EXTENSION-BEDSTEAD. WILLIAM E. PAGE, Kansas, Utah. Filed June 14, 1901. Serial No. 64,641. (No model.)

Claim.—1. An adjustable bedstead comprising ends including posts connected for movement toward and away from each other, side rails connected with the posts having eyes on their inner faces, slots having terminal hooks removably engaged with the eyes and a separable tie constructed and arranged for joint engagement with the rails and for individual engagement with the rails to hold the rails in different spaced relations.

2. An adjustable bedstead comprising side rails arranged for movement toward and away from each other, slots movably engaged with the side rails and adapted for interchangeable cross and spaced relations, eyes carried by one of the rails, hooks carried by the other rail, a two-part tie, each member having a hook at one end and an eye at the other end and adapted for engagement one with the eye of the other and for engagement with the hooks and eyes of side rails when disjoined, the eyes upon the side rails adapted to receive the hooks of the members of the tie when the latter are connected.

697,108. GARMENT-STRETCHER. EDITH PRINCE, Inventing.
Mass. Filed July 12, 1901. Serial No. 12,521. (No model.)

Claim.—1. A trousers-hanger comprising two bars connected to slide with relation to each other, one end of each bar being provided with a head for engaging the waistband of trousers, and prongs carried by the heads to enter and engage the legs of trousers to thereby enable the trousers to be suspended with the waistband either up or down.

2. A trousers-hanger provided with means to engage trousers at their waistband and with separate and independent means to engage the ends of the trousers-legs to thereby enable the trousers to be suspended at will with the waistband either up or down.

3. A trousers-hanger comprising two bars connected to slide one upon the other, means for holding the bars in adjusted relation, one end of each bar being provided with a head for engaging the waistband of trousers, and a plurality of prongs also carried at one end of each bar to enter different legs of trousers to enable the trousers to be suspended with the waistband either up or down.

4. A trousers-hanger provided with means to engage trousers at their waistband and with separate and independent means to engage the ends of the trousers-legs to thereby enable the trousers to be suspended at will with the waistband either up or down, the means for engaging the waistband having provisions for engaging buttons on said waistband.

697,104. BUYSIDE AND TRICYCLE. GEORGE A. E. FLETCHER.
Kata East, Victoria, Australia. Filed July 27, 1901. Serial No. 98,961.
(No model.)

Claim.—1. The combination of the frame, the steering-wheel, a hand-lever in rear of said wheel, a collar on the lower end thereof, a cross-bar pivoted behind said wheel, link connection between said collar and cross-bar, and connections between the said cross-bar and the steering-wheel shaft, whereby the latter is steered by and from said lever, substantially as described.

2. The combination of the frame, the front and rear wheels, a rock-shaft journaled in the frame, pedals on opposite ends of said shaft, and a lever rotatably connected to said shaft, a gear journaled on the frame in rear of the lever, a pinion for actuating said gear from said lever, means for driving the rear wheel from said gear, and connections for steering the front wheel from and by said lever, all substantially as and for the purpose described.

3. The combination of the frame, a steering-wheel, a rotary and reciprocating hand-lever in rear of said wheel, a collar on the lower end of said lever, a cross-bar pivoted behind said wheel, links connecting opposite sides of the collar with said cross-bar at opposite sides of its pivot, and rods connecting the outer ends of said cross-bar with opposite ends of the steering-wheel shaft, all substantially as described.

4. The combination of the frame and front and rear wheels, a rock-shaft journaled in the frame, a lever rotatably connected to said shaft having a collar on its lower end, and pedals on opposite ends of said

shaft, a gear journaled in rear of the lever, a pinion for actuating said gear from said lever, and means for driving the rear wheel from said gear; with an oscillating cross-bar in front of the rock-shaft, links connecting said bar to pins attached to opposite sides of the collar on said lever, and rods connecting the outer ends of said cross-bar to opposite ends of the steering-wheel shaft, all substantially as and for the purpose described.

697,105. CATTLE-STANCHION. OLIVER E. ROSSMAN, Farmville, Conn. Filed Mar. 20, 1899. Serial No. 711,007. (No model.)

Claim.—1. In combination with a pivoted neck-bar of a stanchion, a case secured to the neck-bar and having flanges located on opposite edges of said bar, means independent of the flanges for preventing movement of the case, a latch pivoted in the case, and a catch for engaging the latch.

2. In combination with a pivoted neck-bar of a stanchion, a latch-case secured to the neck-bar and having flanges located on opposite edges of the bar, a lip extending from one of said flanges into a groove in the bar, a latch pivoted to the casing and a catch for engaging the latch.

3. In combination in a loosely-suspended stanchion having top and bottom cross-bars and a rigid neck-bar connecting them, a neck-bar pivoted at one end to one of said cross-bars and having at the opposite end a shoulder engaging the upper surface of the cross-bar when the parts are engaged, whereby longitudinal strains are resisted, and means for temporarily securing the pivoted neck-bar to the upper cross-bar.

4. In a loosely-suspended stanchion, in combination, upper and lower cross-bars, a neck-bar pivoted to one of said cross-bars and adapted to be temporarily secured to the opposite cross-bar by means of a latch, the latch, and a neck-bar secured to said cross-bars and forming one member of a joint including a U-shaped bolt extending along opposite sides of the neck-bar into openings depthwise through the cross-bar, said neck-bar projecting into a mortise extending lengthwise along the inner face of the cross-bar, and means for holding the bolt in position.

5. In combination in a loosely-suspended stanchion having top and bottom cross-bars and connections between said bars including a pivoted neck-bar, a latch-case secured to the pivoted neck-bar and having a shoulder adapted to overlap the top of the top cross-bar whereby longitudinal strains are resisted, and means for temporarily securing the pivoted neck-bar to the upper cross-bar.

6. In a loosely-suspended stanchion in combination, upper and lower cross-bars, a neck-bar pivoted to one of said cross-bars and adapted to be temporarily secured to the opposite cross-bar, one of said cross-bars having two sets of openings depthwise through the cross-bar, the openings in a set being equally spaced with respect to an opening in the opposite set, and a neck-bar secured to said cross-bars and forming one member of a joint including a U-shaped bolt extending through the neck-bar and projecting along opposite edges, the branches being arranged to fit the openings through the cross-bar, whereby adjustment of the cross-bar and neck-bar with respect to each other is permitted and means for holding the bolt in position.

7. In a loosely-suspended stanchion, in combination, upper and lower cross-bars, a neck-bar pivoted to one of said cross-bars and adapted to be temporarily secured to the opposite cross-bar, and a neck-bar secured to said cross-bars and forming one member of a joint including a U-shaped bolt projecting through the neck-bar and extending along opposite sides thereof, the end of the neck-bar projecting into and fitting a mortise of a shape to prevent turning movement of said parts with respect to each other in the cross-bar and each end of the U-shaped bolt projecting through a hole depthwise through the cross-bar, and means for holding the bolt in position.

8. In a loosely-suspended stanchion, in combination, an upper cross-bar having a mortise in its under surface at one end, and a recess at its opposite end, a bottom cross-bar having a mortise at one end and a neck-bar pivoted at its opposite end, a latch-case secured to the pivoted neck-bar and having a latch adapted to engage a catch on the upper cross-bar, and the neck-bar adapted to engage and fit the mortise in said cross-bar, said mortise and bar being of a shape to prevent relative turning movement of the two parts and said bar forming one member of the joint between said parts, each joint including a U-shaped bolt projecting through the neck-bar and extending along opposite sides thereof and through openings depthwise through the cross-bar, and means for holding the bolt in position.

697,108. WINDOW-SCREEN. JOHN S. SUTHERLAND, Paterson, N. J.
Filed Aug. 14, 1901. Serial No. 72,988. (No model.)

Claim.—The combination of a mesh screen having an opening therein, a transparent plate arranged on one side of said screen at said opening, a frame arranged in said screen about said opening, said frame comprising two annular plates disposed on the respective sides of the screen, one of the plates resting against the outer surface of the transparent plate and formed with a continuous shoulder intermediate the edges of said plate and disposed at the edge of the said transparent plate, and means for securing said transparent plate to the frame and the frame to the screen, substantially as described.

697,107. AUTOMATIC MOTOR. GEORGE J. BLATTNER, Detroit, Mich.
Filed Apr. 12, 1901. Serial No. 55,925. (No model.)

Claim.—1. A motor embodying a rotatable base, a stem projecting upwardly therefrom, a cord engaged with the upper end of said stem, means to rotate said stem, and means to hold the stem from rotation.

2. A motor, embodying a rotatable base, a stem or post projecting upwardly from the base and movable longitudinally therein, a cord engaged with the upper end of the stem or post, and a crank-arm engaged with the lower end of said post, said crank-arm also engageable with the base to hold the stem from rotating.

3. A motor embodying a rotatable base, a cord connected with said base intermediate the extremities of the base, means to twist the cord, and a retarding-fan engaged with said base, said base extending laterally from said cord.

4. A motor embodying a rotatable base, a cord connected with said base intermediate the extremities of the base, means to twist the cord, and retarding-fans engaged with opposite extremities of said base, said base extending laterally from said cord.

5. A motor embodying a rotatable base, an elastic cord connected with said base intermediate of the extremities of the base, and a crank-handle arranged to twist said cord, said base extended laterally from said cord.

6. A motor embodying a rotatable base, provided intermediate its extremities with an upwardly-projecting stem or cord, a cord engaged with the upper end of said post, and means for twisting said cord, said post movable longitudinally through the base, said base extended laterally from said cord.

7. A motor embodying a rotatable base, a stem projecting upwardly therefrom, a cord engaged with the upper end of said stem, means to rotate said stem, and means to hold the stem from rotation, said base provided with means to retard its rotation.

697,108. CHANGERECEIVER. CURTIS V. SMITH, Baltimore, Ohio.
Filed Dec. 21, 1901. Serial No. 54,508. (No model.)

Claim.—1. A coin-receiver, comprising a plate having a series of prongs or fingers dividing the plate into coin-receiving grooves of a length sufficient to hold a number of coins, and a coin-receptacle arranged at the inner end of each of the grooves.

2. A coin-receiver comprising a plate having a series of prongs or fingers dividing said plate into coin-receiving grooves, the outer ends of the prongs or fingers being rounded or tapering to afford a widened entrance for the coins to the grooves.

3. A coin-receiver comprising a plate having a series of grooves of different width and of a length sufficient to hold a small number of coins in convenient position for making change, and a removable coin-receiver arranged at the inner end of and in communication with said grooves.

4. A coin-receiver comprising a grooved plate having downwardly-extending sockets at the termination of the grooves and adapted to receive openings in the table by which the plate is carried, and a series of removable coin-receptacles extending around and carried by said sockets.

5. A coin-receiver comprising a plate having a series of prongs of a length sufficient to hold a number of coins, the edges of said prongs being provided with guides for the edges of the coins, sockets depending from the inner portions of the grooves and in alignment therewith, holding-pins on said sockets, and slotted coin-receptacles supported in position by said pins, substantially as specified.

697,109. OIL-CUP. WILLIAM E. S. STONE, Hartford, Conn., assignor, by direct and means assignments, to the Whitley Company, a Corporation of Connecticut. Filed Apr. 22, 1900. Serial No. 14,310. (No model.)

Claim.—1. In an oil-cup, the combination of a thimble, provided with an oil-inlet and with a slot, a cover having a similar inlet, and mounted upon the thimble to oscillate far enough to bring the oil-inlet into and out of coincidence; and a spring located within the thimble and extending through the wall thereof to resiliently hold the cover with its inlet out of coincidence with that of the thimble.

2. In an oil-cup, the combination of a thimble, provided with an oil-inlet and with a slot, a cover having a similar inlet, and mounted upon the thimble to oscillate far enough to bring the oil-inlet into and out of coincidence, and a spring extending through the slot of the thimble to resiliently hold the cover with its inlet out of coincidence with that of the thimble, the slot and spring serving to prevent longitudinal movement of the cover and to limit the oscillatory movement thereof.

3. In an oil-cup, the combination of a cylindrical thimble provided with an oil-inlet and with a slot, a cylindrical cover having a similar inlet and mounted upon the thimble to oscillate far enough to bring its inlet into and out of coincidence with that of the thimble, and a torsional spring attached to and located within the thimble, and extending through the slot thereof to resiliently hold the cover at one end of its oscillatory movement with its oil-inlet out of coincidence with that of the thimble, the slot and spring serving to prevent longitudinal movement of the cover, and to limit the oscillatory movement thereof.

697,110. OIL-CUP. WILLIAM E. & STROSS, Hartford, Conn., assigners, by direct and mesne assignments, to the Whitley Company, a Corporation of Connecticut. Filed Apr. 26, 1900. Serial No. 14,511. (No model.)

Claim.—1. In an oil-cup, the combination of a thimble provided with an oil-receiving aperture at its side, a longitudinally-movable plunger within the thimble for opening and closing the aperture thereof, one of the said parts being provided with parts for conducting the oil past the plunger when the latter is in its aperture-opening position.

2. In an oil-cup, the combination of a thimble, provided with an oil-receiving aperture at its side and adapted to be attached to a bearing, and a longitudinally-movable plunger within the thimble for opening and closing the aperture thereof, the plunger being provided with parts for the passage of the oil.

3. In an oil-cup, the combination of a thimble provided with an oil-receiving aperture at its side, a push-down plunger within the thimble, for opening and closing the oil-receiving aperture, and having a reduced stem extending through the top of the thimble, means for yieldingly holding the plunger in its aperture-closing position, and parts communicating with the aperture when the plunger is pushed down, for the downward flow of the oil past the plunger.

4. In an oil-cup the combination of a thimble, provided with an oil-receiving aperture at its side, a longitudinally-movable plunger within the thimble, with its side closing the oil-receiving aperture, the plunger being provided with a reduced stem extending through the top of the thimble, and with a recess in the upper surface of the plunger, having ports leading therefrom for the passage of the oil past the plunger.

697,111. MEANS FOR COOLING MILK-CANS. SAMUEL C. SULLIVAN, Erie, Pa. Filed Aug. 2, 1901. Serial No. 71,206. (No model.)

Claim.—1. In a means for cooling milk-cans, the combination with a can having a contracted opening at the top and a top wall leading to said opening, of a removable ice-receptacle arranged on the top of the can, the bottom of said receptacle being provided with a series of openings within the area above the top wall of the can, whereby the water from the ice may pass from said openings onto the shoulder of the can.

2. In a means for cooling milk-cans, the combination with a can having a contracted opening at the top and a wall leading to said opening, of an ice-receptacle arranged on the top of the can and having a wall extending from the bottom thereof to a point below the top of the can, said

receptacle being provided with an opening from which the water from the ice passes onto said top wall of the can and then down the side of the can between the wall of the can and the extension.

3. In a means for cooling milk-cans, the combination of the can, A, having the top wall, a; the removable receptacle, B, arranged on top of the can, having the extension, E, extending from the removable receptacle B, down below the top of the side wall of the can; the bottom, b, of the removable receptacle being provided with the opening, b', and the cover, B', for closing the top of the removable receptacle, B.

697,112. FARM-WINDLASS AND WAGON-HOIST. THOMAS H. TAYLOR, Montgomery, Ala. Filed Jan. 2, 1902. Serial No. 22,126. (No model.)

Claim.—1. The combination with a wagon-body, of an equalizing-board attached to each end-board, and provided with a number of holes, a sling connected to each of said equalizing-boards, a lifting rope or cable extending from each sling over a suitable pulley, a windlass connected by rope or cable to both said lifting-ropes, and a swivel-grapple by which the windlass is clamped to the wagon-tongue.

2. The combination with a wagon-body, of equalizing-boards having a series of perforations, slings which can be attached to said boards, a windlass, and ropes from the windlass to the slings of the equalizing-boards.

3. The combination with suspension connections to a wagon-body, of a windlass and connected cable, a swiveled grapple on the windlass, the wagon-tongue passing through said grapple, means for winding the windlass, and means for holding the windlass-drum against backward movement, substantially as described.

4. In a farm-windlass, the frame or yoke having a swiveled grapple at its closed side, a bar near one of the end bars and a crank-shaft having its bearings in said bar and the end bar, a drum in the yoke, engaging pinions on the drum and crank-shaft outside the yoke, a cable on the drum, and a swiveled hook attached to said cable, all combined.

697,118. FERTILIZER-DISTRIBUTING ATTACHMENT FOR CULTIVATORS. SAMUEL TAMMAMILL, Jr., Augusta, Ga. Filed July 12, 1901. Serial No. 68,827. (No model.)

Claim.—1. In an attachment for cultivators, the combination with a beam, of a hopper secured on the beam and having a flanged lower end, a spout below the beam, a flange on the upper end of said spout secured to the flange at the bottom of the hopper, a distributor, links secured to the flange and pivotally supporting the distributor, and means for shaking the latter.

2. In an attachment for cultivators, the combination with a beam, of a hopper secured on the beam and having a flanged lower end, a spout below the beam, a flange on the upper end of said spout secured to the flange at the bottom of the hopper, a distributor, links secured to the flange and pivotally supporting the distributor, means in the spout for regulating the discharge of fertilizer and means for shaking the distributor.

3. In an attachment for cultivators, the combination with a beam,

of a hopper thereon, a shaking distributor below the hopper, a wheel revolvably supported on the beam and comprising two metal disks, fingers punched from the disks and alternately disposed around the same, and a yoke secured to the distributor and adapted to be alternately engaged by the teeth on the opposite sides of said wheel to shake the distributor.

697,114. BEARING-BRACKET FOR VERTICALLY-ADJUSTABLE SHADE-ROLLERS. CALVIN P. THOMAS, Grand Rapids, Mich. Filed Apr. 13, 1901. Serial No. 86,744. (No model.)

Claim.—1. In a window-shade-hanging apparatus, the combination with an upright guide, of a roller-bracket comprising opposite members, of which one member has opposite slidable connections with the guide, and an intermediate laterally-projected pin-act, and the other member has an intermediate slot through which the pin-act is projected, and a shade-roller having a spring-actuated pin-act in the seat and rigidly clamped between the members of the roller-bracket.

2. A shade-roller bracket comprising opposite reversely-bowed members, of which one has a longitudinal slot, and the other is a spring member having its intermediate portion projected through the slot from the convex side of the first-mentioned member, and also provided with opposite terminal guide-openings, the opening between the intermediate portions of the two members forming a pin-act-receiving seat.

697,115. CASTING-MOLD. EDWIN D. TUCKER, New York, N. Y., assigner, by direct and mesne assignments, to Robert Hoe and Charles W. Carpenter, (partners under name of R. Hoe and Company, of New York, N. Y.) Filed Mar. 13, 1904. Serial No. 674,364. (No model.)

Claim.—1. In a stereotype-plate-casting box, the combination with the body and cover of locking devices comprising separate locking members at each side of the box carried by one of said parts, cooperating locking means carried by the other part, said means including devices which separately engage the separate locking members, means independent of the locking devices for separating the cover from the bottom portion when the parts of the locking devices are disengaged, and a single instrumentality for operating the separating means and causing the disengagement of the locking devices, substantially as described.

2. In a stereotype-plate-casting box, the combination with the body of a cover pivoted thereto, locking devices comprising separate locking members at each side of the box carried by one of said parts, cooperating locking means carried by the other part, said means including devices which separately engage the separate locking members, means independent of the locking devices for separating the cover from the bottom portion when the parts of the locking devices are disengaged, and a single instrumentality for operating the separating means and causing the disengagement of the locking devices, substantially as described.

3. In a casting-box, the combination with the bottom portion, of a cover pivoted thereto, cooperating locking members between the cover and the bottom portion, one of said members having a reciprocating movement, releasing means for turning the cover slightly on its pivot to free it from the bottom portion after the cast has been made, and a single instrumentality for reciprocating the locking member and operating the releasing means, substantially as described.

4. In a casting-box, the combination with the bottom portion, of a cover pivoted thereto, cooperating locking members between the cover and the bottom portion, one of said members having a reciprocating movement, releasing means for turning the cover slightly on its pivot to free it from the bottom portion after the cast has been made, a shaft, and means whereby the operation of the shaft reciprocates the locking member and operates the releasing means, substantially as described.

5. In a casting-box, the combination with the bottom portion, of a cover pivoted thereto, a locking-bar carried on the cover, legs adjustably mounted on the bottom portion whereby wear may be compensated for, separating devices whereby the cover is slightly lifted from the bottom portion, and a single instrumentality for operating both the locking-bar and the separating devices, substantially as described.

6. The combination of the bottom portion of a mold, of a cover pivoted thereto, locking-bar C, a shaft, means operated by the shaft for moving the bar to and fro, and eccentric K mounted upon the shaft, for turning the cover slightly on its pivot and thus separating it from the bottom portion of the mold, whereby the two portions of the mold may be locked or separated by rotation of a single shaft, substantially as described.

7. The combination of the bottom portion and cover of a mold, means for locking them together, a shaft mounted upon the cover and adapted to operate the locking means, means for separating the cover from the bottom, also operated by the shaft, and means for fixing the shaft in a position intermediate between the position in which it causes the parts to be locked together and the position in which it causes them to be separated, substantially as described.

8. The combination of the bottom portion of a stereotype-mold and the cover thereof pivoted together, with the locking-bar C, a shaft, means operated by the shaft to draw the locking-bar into its locking position when rotated in one direction, eccentric mounted upon said shaft and adapted to force the cover from the bottom when the shaft is rotated in another direction, and means for holding the shaft in an intermediate position, substantially as described.

9. In a casting-box, the combination with the bottom portion of a cover pivoted thereto, cooperating locking members carried by the bottom and the cover, a shaft, a rack-and-pinion connection between one of the locking members and the shaft, cams on the shaft for separating the cover from the bottom portion, by turning it slightly on its pivot, and means for operating the shaft, substantially as described.

10. In a casting-box, the combination with the bottom portion, of a cover pivoted thereto, a sliding locking-bar carried by the cover, cooperating locking devices on the bottom portion, a shaft mounted in the cover, a rack-and-pinion connection between the bar and the shaft, cams on the shaft for separating the cover from the bottom portion by turning it slightly on its pivot, and means for rocking the shaft, substantially as described.

11. In a casting-box, the combination of a case, a core pivoted to said case and adapted to fit therein, means for lifting the core out of the case, locking devices adapted to secure the core in the case, and means operated by the actuation of said lifting devices for unlocking the core from the case, substantially as described.

12. In a casting-box, the combination of a case, a core pivoted thereto, locking mechanism adapted to lock the core and case together, core-lifting devices, and connecting mechanism between said locking mechanism and said core-lifting devices which operates to unlock the core when said lifting devices are actuated to lift the core, substantially as described.

697,116. DOUBLETREE-EVENER. LARSEN A. TURNER, Beaver Falls, Ind. Filed Jan. 28, 1902. Serial No. 91,005. (No model.)

Claim.—In combination with a doubtree having a centrally-disposed aperture, a bolt B having an eye B' at one end, and passing through said aperture, a head C to said bolt, a spring interposed between the doubtree and said head, bolts E mounted in apertures at the ends of said

doubletree and having eyes E to which singletrees are adapted to be connected, heads G separate from each other, on said bolts E, and springs interposed between the rear inclined edges of the doubletree and heads G, as shown and described.

697,117. POCKET-INHALER. HARRY J. VALENTINE, Hempstead, N. Y., assignor to William Vogel & Brothers, Borough of Brooklyn, New York, N. Y., a Firm. Filed Sept. 3, 1901. Serial No. 74,083. (No model.)

Claim.—In an inhaler, the combination with a casing, of a sliding cartridge; one of which has a projection, and the other being provided with a longitudinal groove to allow the cartridge to have a limited sliding movement and with an angular groove communicating with the longitudinal groove and opening at the edge of the member of the inhaler upon which the groove is provided to allow the cartridge to be removed.

697,118. FELLY FOR VEHICLE-WHEELS. CHARLES E. VAN HORN, Philadelphia, Pa. Filed Dec. 8, 1900. Renewed Mar. 5, 1902. Serial No. 61,841. (No model.)

Claim.—1. In a felly, parallel, longitudinally-extending tubular metal felly members each having the inner bracing-wall, outer side wall, and tire-receiving face between said walls.

2. In a felly, parallel, longitudinally-extending tubular metal felly members each having the inner bracing-wall, outer side wall, tire-receiving face between said walls, and tire-retaining flange.

3. In a felly, parallel, longitudinally-extending tubular metal felly members each having the inner bracing-wall, outer side wall, tire-receiving face between said walls, and spoke-sockets in said walls.

4. In a felly, the combination of parallel metal felly members having spoke-sockets, and spoke-tension socket-pieces having prongs confined in said spoke-sockets.

5. In a felly, the combination of tubular metal felly members having spoke-sockets, and spoke-tension socket-pieces having prongs confined in said spoke-sockets and clamping said members together.

6. In a felly, the corresponding tubular members each having one of its sides forming an inner bracing-wall.

7. In a felly, the corresponding tubular members formed with inner bracing-walls, and removable spoke-tension socket-pieces engaging said members.

8. In a felly, the corresponding tubular members formed with inner bracing-walls, and removable spoke-tension socket-pieces clamping said members against separation.

9. In a felly, the corresponding tubular members having corresponding sockets and inner bracing-walls having longitudinal flat sides, and spoke-tension socket-pieces in said sockets.

10. In a felly, the corresponding tubular members having corresponding sockets and inner bracing-walls having longitudinal flat sides, and removable spoke-tension socket-pieces fitting said sockets and engaging said bracing-walls to clamp said members together.

11. In a felly, the combination of corresponding tubular felly members having corresponding sockets and inner bracing-walls and removable spoke-tension socket-pieces having prongs entering said sockets and embracing said walls.

12. In a felly, the combination of corresponding tubular felly members having corresponding sockets and inner bracing-walls, and removable spoke-tension socket-pieces having heads fitting against said members and having prongs entering said sockets and embracing said bracing-walls.

697,119. CAM FOR STAMP-MILLS. JAMES C. H. VADNEY, Philadelphia, Mont. Filed Aug. 15, 1899. Renewed Sept. 26, 1901. Serial No. 78,532. (No model.)

Claim.—1. A device of the class described comprising a cam provided with dovetailed recesses, and a shoe having lugs or enlargements arranged on its inner face and detachably interlocked with the dovetailed recesses, substantially as described.

2. A device of the class described comprising a cam provided at its engaging face with a longitudinal groove having a series of tapering recesses with undercut edges, and a shoe detachably interlocked with the cam and provided at its inner face with a rib having tapering enlargements engaging the said recesses, substantially as described.

3. A device of the class described comprising a cam provided with a longitudinal groove having outwardly-tapered dovetailed recesses, and a shoe provided with a longitudinal rib arranged in said groove and having outwardly-tapered enlargements interlocking with the dovetailed recesses, substantially as described.

4. A device of the class described comprising a cam having a longitudinal groove provided with dovetailed recesses, a shoe having a rib arranged in the groove and provided with lugs or enlargements interlocked with the said recesses, and a pin or key of soft metal arranged within the inner end of the groove and engaging the shoe, substantially as described.

5. A device of the class described comprising a cam provided with a longitudinal groove having tapering recesses with undercut side walls and beveled transverse shoulders, a shoe provided with a rib having tapering legs provided with undercut side edges and beveled end edges, and a plug or key engaging the inner edge of the shoe, substantially as described.

697,120. JEWELER'S TOOL. ROYAL E. WARR, Hinn. Wash. Filed June 7, 1901. Serial No. 62,599. (No model.)

Claim.—1. A jeweler's tool comprising a tubular body open at both ends, and provided with a longitudinal slot therein, said tube having hollow bits formed on its opposite ends, an endwise-slidable stem mounted in said body and having terminal bits on its opposite ends, said stem being adapted to be projected at opposite ends of the body, a sliding sleeve mounted on said tubular body and adapted to cover said slot, and a pin connecting the sleeve and stem and working in said slot.

2. A tool of the character described, comprising a tubular open-ended body, having an intermediate longitudinal slot, and its opposite ends formed into hollow bits, an endwise-slidable stem mounted within the body, and having its opposite ends formed into terminal bits, the stem being constructed to be projected alternately at opposite ends of the body, an adjusting-sleeve slidably mounted upon the body and closing the slot, a pin connecting the sleeve and stem and working in the slot, and an intermediate-bowed spring located in the slot and in frictional engagement with the pin to hold the stem against accidental movement at its opposite limits.

3. A jeweler's tool comprising a tubular body open at both ends and having the internal diameter of one end decreased to form a marginal shoulder, said body having an intermediate slot therein, hollow bits formed on the opposite end of said tube, and provided with jewel-spanning sockets, an endwise-slidable stem mounted in said body having one end reduced to form a shoulder, said shoulder being adapted to abut against said marginal shoulder on the body and limit the movement of the stem in one direction, terminal bits disposed on the opposite ends of said stem, a sliding sleeve mounted on said tubular body and adapted to cover said slot, and a pin connecting the sleeve and stem and working in said slot.

697,121. REIN SUPPORT AND HOLDER. JAMES S. WAKEMFIELD, Mansum, Okla. Filed Dec. 30, 1901. Serial No. 57,994. (No model.)

Claim.—1. A rein-support comprising a frame outwardly bowed at its upper end and provided with a rein-guide, the rear portion of said support being adapted to extend within the dashboard of the vehicle, and a pair of adjustable clamps engaging with the lower and intermediate portions of said frame.

2. A rein-support comprising two parallel bars joined together at their lower ends, a rein-loop connecting the upper ends of said bars, a rein-holder disposed on said bars, and clamps for attaching said bars to the body of a vehicle.

3. A rein-support comprising a frame bowed outward at its upper portion and provided with a rein-loop at its upper end, a clamp adapted to engage the upper part of said frame near its bowed portion and clamp it to a dashboard, and another clamp adapted to engage the lower end of said frame and fasten it to a vehicle-body.

697,122. LIFE-GUARD. THOMAS E. C. WHELAN, Liverpool, England. Filed June 12, 1901. Serial No. 63,097. (No model.)

Claim.—1. A life-guard for vehicles, comprising a frame pivoted to the vehicle, a shaft journaled on the frame to the rear of its fulcrum, a spring-actuated lever carried by the shaft for engaging a projection on the vehicle, an arm depending from the shaft, and means extending to the

front of the frame for engaging said arm and releasing the lever when an obstruction is struck by the guard, substantially as described.

2. A life-guard for vehicles, comprising a frame pivoted to the vehicle, a shaft journaled on the rear end of the frame to the rear of the fulcrum-point thereof, a spring-actuated lever carried by said shaft for engaging a projection on the vehicle, an arm for rotating the said shaft, a yoke mounted in bearings on the frame and adapted to engage the said lever, and a roller upon the said yoke arranged in front of the frame, the structure being such that an object engaging the said roller will force it rearwardly and disengage the rear end of the frame from the vehicle, permitting the forward end of said frame to drop upon the ground or track, substantially as described.

697,123. MEANS FOR TRANSMITTING ELECTRICAL ENERGY. JONATHAN E. WOODWARD, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Sept. 20, 1901. Serial No. 73,738. (No model.)

Claim.—1. The combination of a source of alternating currents, lines extending therefrom, inductance-coils connected at intervals in said lines, and a compound-wound rotary converter supplied with current from said lines.

2. The combination of a source of alternating currents, transmitting-lines extending therefrom, a series of inductance-coils connected in each line, and a compound-wound rotary converter connected to the receiving end of the transmission-lines.

3. The combination of a source of alternating currents, transmitting-lines extending therefrom, inductance-coils located at intervals in said lines, and a source of leading current connected to the receiving end of the transmission-lines.

4. The combination of a source of alternating current, transmission-lines supplied thereby, inductance-coils connected at regular intervals in said lines, and a source of leading current such as a rotary converter supplied with current from the receiving end of the transmission-lines.

697,124. RAILWAY-COUPLING. ALBERT WYNN, Berlin, Germany. Filed May 11, 1901. Serial No. 60,099. (No model.)

Claim.—1. A coupling for railway-carriages and for trucks comprising in combination a cross-beam 2 mounted on and guided between the buffers, U-shaped blocks 1 suitably mounted on the end of the carriage or truck, an articulated plate 4 resting on the chain-wheels 5 to which it is also jointed, angle-irons 10 jointed to the chain on the chain-

wheel 5 and adapted to be moved by the hook 1 on the carriage or trucks colliding together and then to turn the chain-wheel 5 and lower the plate 4 into the hook 1, substantially as and for the purpose set forth.

2. A coupling for railway carriages and trucks comprising in combination a cross-beam 2 mounted on and guided between the buffers, a cross-beam 3 sliding in the cross-beam 2, U-shaped hooks 1 secured to the cross-beam 3, an articulated plate 4 resting on and jointed to the chain-wheel 5, chain 7 passing around the chain-wheel 5 and the pinion 16, angle-iron 10 jointed to the chain on the chain-wheel 5 and adapted to be moved by the hook 1 on the carriage or trucks colliding together and thus to turn the chain-wheel 5 and lower the plate 4 into the hook 1, substantially as and for the purpose set forth.

3. A coupling for railway carriages and trucks comprising in combination a cross-beam 2 mounted on and guided between the buffers, a cross-beam 3 sliding in the cross-beam 2, U-shaped hooks 1 secured to the cross-beam 3, an articulated plate 4, resting on and jointed to the chain-wheel 5, chain-wheel 5 supported on the hook 1, chain 7 passing around the chain-wheel 5 and the pinion 16, angle-iron 10 jointed to the chain on the chain-wheel 5 and adapted to be moved by the hook 1 on the carriage or trucks colliding together and thus to turn the chain-wheel 5 and lower the plate 4 into the hook 1, chain-wheel 20 mounted on a shaft 19 carried by the beam 2, a spring likewise mounted on the shaft 19 and adapted by means of the chain-wheel 20 and chain 21 to be wound up on the articulated plate 4 being lowered, a ratchet and pawl likewise mounted on the shaft 19, substantially as and for the purpose set forth.

4. A coupling for railway carriages and trucks comprising in combination a cross-beam 2 mounted on and guided between the buffers, a cross-beam 3 sliding in the cross-beam 2, U-shaped hooks 1 secured to the cross-beam 3, an articulated plate 4 resting on and jointed to the chain-wheel 5, chain-wheel 5 supported on the hook 1, chain 7 passing around the chain-wheel 5 and a pinion 16, angle-iron 10 jointed to the chain on the chain-wheel 5 and adapted to be moved by the hook 1 on the carriage or trucks colliding together and thus to turn the chain-wheel 5 and lower the plate 4 between the hooks 1, and means for raising the articulated plate and thus uncouple the carriage or trucks, substantially as set forth.

5. A coupling for railway carriages and trucks comprising in combination a cross-beam 2 mounted on and guided between the buffers, a cross-beam 3 sliding in the cross-beam 2, U-shaped hooks 1 secured to the cross-beam 3, chain-wheel 5 supported on the hook 1, an articulated plate 4 resting on and jointed to the chain-wheel 5, chain 7 passing around the chain-wheel 5 and the pinion 16, three angle-irons 10 jointed to chain 7 on the chain-wheel 5 and adapted to be moved by the ends 9 of the hook 1 on the carriage or trucks colliding together and thus to

turn the chain-wheel 5 and lower the plate 4 between the hook 1 a plate 13 underneath the beam 2 and a spring keeping said plate in its normal position, all substantially as and for the purpose set forth.

6. A coupling for railway carriages and trucks comprising in combination a cross-beam 2 mounted on and guided between the buffers, a cross-beam 3 sliding in the cross-beam 2, and adapted to be moved longitudinally relative to the beam 2, U-shaped hooks 1 secured to said beam 3, chain-wheel 5 supported on the hook 1, an articulated plate 4 resting on and jointed to the chain-wheel 5, chain 7 passing around each chain-wheel 5 and pinion 16, angle-irons 10 jointed to the chain 7 and adapted to be moved by the hook 1 on the carriage or trucks colliding together and thus to turn the chain-wheel 5 and lower the plate 4 between the hooks 1, means for raising the articulated plate and thus uncouple the carriage or trucks, and means for securing the hook and corresponding parts in either the left or right hand position, substantially as set forth.

7. A coupling for railway carriages and trucks comprising in combination a cross-beam 2 mounted on and guided between the buffers, a cross-beam 3 sliding in the cross-beam 2, U-shaped hooks 1 secured to the cross-beam 3, vertically-mounted rollers 14 on the hook 1, chain-wheel 5 supported on the hook 1, an articulated plate 4 resting on and jointed to the chain-wheel 5, chain 7 passing around each chain-wheel 5 and pinion 16, angle-irons 10 jointed to the chain 7 and adapted to be moved by the hook 1 on the carriage or trucks colliding together and thus to turn the chain-wheel 5 and lower the plate 4 between the hooks 1, means for raising the articulated plate and thus uncouple the carriage or trucks and means for securing the hook and corresponding parts in either the left or right hand position, substantially as set forth.

8. A coupling for railway carriages and trucks comprising in combination a cross-beam 2 mounted on and guided between the buffers, rails 20 secured to the buffers 20 and adapted to guide the cross-beam 2, a cross-beam 3 sliding in the cross-beam 2, U-shaped hooks 1 secured to said beam 3, chain-wheel 5 supported on the hook 1, an articulated plate 4 resting on and jointed to the chain-wheel 5, chain 7 passing around each chain-wheel 5 and pinion 16, angle-irons 10 jointed to the chain 7 and adapted to be moved by the hook 1 on the carriage or trucks colliding together and thus to turn the chain-wheel 5 and lower the plate 4 between the hooks 1, substantially as set forth.

9. A coupling for railway carriages and trucks, comprising in combination a cross-beam 2 mounted on and guided between the buffers, U-shaped hooks 1 suitably mounted on the end of the carriage or truck, disk or wheel 5 supported by the hook 1, an articulated plate 4, chain 21 secured to the articulated plate 4, pulleys or chain-wheels 20 over which the chain 21 pass and means adapted to rotate the chain-wheels 20, substantially as and for the purpose set forth.

10. A coupling for railway carriages and trucks comprising in combination a cross-beam 2 mounted on and guided between the buffers, a cross-beam 3 sliding in the hollow cross-beam 2, a spring for the cross-beam 3 against which the ends 9 of the hook 1 bear when the carriage or trucks are brought together, U-shaped hooks 1, suitably mounted on the end of the carriage or trucks, disk or wheel 5 supported by the hook 1, an articulated plate 4, chain 21 secured to the articulated plate 4, chain-wheel 20 over which the chain 21 pass, means adapted to rotate the chain-wheel 20 and means for raising the articulated plate and thus to uncouple the carriage or trucks, substantially as set forth.

697,125. CAR-VENTILATOR. EMANUEL ANDERSON, Danversville Mass., assignor to Amos L. Wood, Boston, Mass. Filed Sept. 20, 1901. Serial No. 78,596. (No model.)

Claim.—1. A ventilator of the kind described comprising an outlet-pipe provided at its end with a double-ended hood open from end to end and containing a drum composed of a frustoconical cylinder providing outlets for the gases and closed at each end by a pointed deflector.

2. A ventilator of the kind described comprising an outlet-pipe provided at its ends with a double-ended hood open from end to end and containing a drum provided peripherally with outlets for the gases, and said drum having at its opposite end conical deflectors, said deflectors projecting beyond the surface of said drum at their edges.

3. A ventilator of the kind described comprising an outlet-pipe provided at its end with a double-ended hood open from end to end and con-

training a drum having sides of firmness material permitting the escape of gases but preventing entrance of leaves, &c., and having its ends closed.

697,136. LOADING-TRAY FOR TRANSFERRING AMMUNITION. JULIUS BUCKER, Essen, Germany, assignor to Fried. Krupp, A. G., Essen, Germany. Filed Jan. 2, 1902. Serial No. 98,978. (No model.)

Claim.—1. A device for transferring ammunition from a receiving-point to the leading-axis of a gun, comprising a quadrangular structure swinging upon pivots located between the vertical planes of said receiving-point and leading-axis, one side of the quadrangle formed by the leading-tray, and said leading-tray moving in a vertical arc with its chord horizontal or approximately horizontal.

2. A leading-tray for transferring ammunition from the lift to the leading-axis of the gun, comprising a jointed quadrangular structure swinging upon horizontal axes, having one side formed by the leading-tray, the side of the quadrangle opposite the leading-tray being shiftable substantially as described to change the angle of the leading-tray and permit its return to receiving position prior to the withdrawal of the rammer.

3. A leading-tray for transferring ammunition from the lift to the leading-axis of the gun, comprising a jointed quadrangular structure swinging upon horizontal axes, having one side formed by the leading-tray, the side of the quadrangle opposite the leading-tray being shiftable substantially as described to change the angle of the leading-tray and permit its return to receiving position prior to the withdrawal of the rammer, and having a controlling-lever for shifting said side.

4. A leading-tray for transferring ammunition from the lift to the leading-axis of the gun, comprising a jointed quadrangular structure swinging upon horizontal axes, having one side formed by the leading-tray, the side of the quadrangle opposite the leading-tray being shiftable substantially as described to change the angle of the leading-tray and permit its return to receiving position prior to the withdrawal of the rammer, and having a controlling-lever for shifting said side, provided with means for locking it at the opposite ends of its throw.

5. A leading-tray for transferring ammunition from the lift to the leading-axis of the gun, comprising a jointed quadrangular structure swinging upon horizontal axes, located between the vertical planes of the lift and of the axis of the gun, having one side formed by the leading-tray, and suitable stops for limiting the throw of the leading-tray, engaging a part of the swinging structure near the axis upon which it swings.

6. A leading-tray for transferring ammunition from the lift to the leading-axis of the gun, comprising a jointed quadrangular structure swinging upon horizontal axes, located between the vertical planes of the ammunition-lift and of the leading-axis, having one side formed by the leading-tray, a motor located and connected with the structure adjacent to the axis upon which it swings, for swinging the quadrangle from side to side, and bringing the leading-tray from one position to another, and suitable stops for limiting the motion of said parts, engaging a part of the swinging structure adjacent to said axis.

7. An ammunition-conveyor for transferring ammunition laterally from the ammunition-lift to the leading-axis of the gun, comprising a quadrangular structure having one side formed by the leading-tray, swinging upon horizontal axes in a vertical arc having a substantially horizontal chord, an arm connected with one side of the quadrilateral structure near its axis, and a motor-cylinder and piston, one of which is pivotally connected to a fixed support and the other of which is connected to said projections.

8. An ammunition-conveyor comprising a rectangular structure having one side formed by a leading-tray, horizontal axes located between the vertical planes of the receiving-point and the leading-axis of the gun, and causing the tray to swing in a vertical arc with a substantially horizontal axis, stops located near said axes, and arms projecting from the

quadrangular structure near the axes, engaging said stops as the tray reaches the opposite limits of its movement.

9. An ammunition-conveyor comprising concentric horizontal shafts C and F, long arm E and angularly-disposed short arm f projecting from said shafts, link H, jointed to the short arm f, tray D jointed to arm E and link H, arm c projecting from shaft C, and motor K secured to a fixed support and connected with the arm c.

10. In an ammunition-conveyor, the combination of the concentric shafts C and F, arms E, E, projecting from the shaft C, arms f, g, projecting from the shaft F, links H, H, jointed to the arms f, g, and paralleling the arms E, E, and tray D having hinging connection with arms E, E, and links H, H.

11. In an ammunition-conveyor, the combination of the concentric shafts C and F, arms E, E, projecting from the shaft C, arms f, g, projecting from the shaft F, links H, H, jointed to the arms f, g, and paralleling the arms E, E, tray D having hinging connection with arms E, E, and links H, H, and stop-arms O, P, projecting from shaft C, stops R, R, impinged by said stop-arms at opposite ends of the tray's movement, and controlling-arm c also projecting from shaft C.

12. In an ammunition-conveyor, the combination of the concentric shafts C and F, arms E, E, projecting from shaft C, arms f, g, projecting from the shaft F, links H, H, jointed to the arms f, g, and paralleling the arms E, E, tray D having hinging connection with arms E, E, and links H, H, stop-arms O, P, projecting from shaft C, stops R, R, impinged by said stop-arms at opposite ends of the tray's movement, and controlling-arm c also projecting from shaft C.

13. In an ammunition-conveyor, the combination of the concentric shafts C and F, arms E, E, projecting from the shaft C, arms f, g, projecting from the shaft F, links H, H, jointed to the arms f, g, and paralleling the arms E, E, tray D having hinging connection with arms E, E, and links H, H, stop-arms O, P, projecting from shaft C, stops R, R, impinged by said stop-arms at opposite ends of the tray's movement, controlling-arm c, also projecting from shaft C, and motor-cylinder K pivoted to a fixed support and having its piston connected with arm c.

14. In an ammunition-conveyor, the combination of the concentric shafts C and F, arms E, E, projecting from the shaft C, arms f, g, projecting from the shaft F, links H, H, jointed to the arms f, g, and paralleling the arms E, E, tray D having hinging connection with arms E, E, and links H, H, and lever G connected with shaft F for changing the angle of arms f, g, relatively to arms E, E, and thereby tilting the tray.

697,137. CANDLE-HOLDER. CONRAD BOCHSOMMER, Long Island City, N. Y. Filed Apr. 10, 1900. Renewed Oct. 28, 1901. Serial No. 80,120. (No model.)

Claim.—An improved candle-holder for Christmas trees, comprising a conical piece formed with a recess upon its lower end for engaging around the branch of a tree, a flat piece pivotally fastened to the said tubular piece, a flange or jaw formed upon the upper end of said conical piece, a flange or jaw formed upon the said flat piece and adapted with the flange or jaw upon the said conical piece to hold a candle, a slot formed upon the said conical piece and adapted to admit the jaw or flange formed upon the said flat piece, and a spring having two projecting arms suitably mounted upon the device and adapted to normally keep the said jaws closed, substantially as described.

697,138. SUPPORT FOR STRAIN-TURNING WHEELS. JONAS A. BOWSER, Stockholm, Sweden, assignor to De Laval Steam Turbine Company, a Corporation of New Jersey. Filed Oct. 18, 1901. Serial No. 73,130. (No model.)

Claim.—1. The combination with a wheel having sockets on opposite sides thereof, of the supporting shaft-sections having enlarged end portions constructed to enter and fill said sockets, and means for rigidly connecting said shaft-sections to said wheel.

E. The combination with a wheel having sockets on opposite sides thereof of supporting shaft-sections having enlarged end portions F, G constructed to enter and fill said sockets, flanges H, I on said end portions, and bolts rigidly connecting said flanges to said wheel.

697,129. MEANS FOR ROASTING COFFEE. BENJAMIN BOTE, Pockham, England. Filed Feb. 14, 1901. Serial No. 29,202. (No model.)

Claim.—1. In a roasting drying or torrefying apparatus a closed drum mounted with capability of revolution means for heating the same, a closed cylinder arranged axially within the drum, a number of radially-disposed open-ended and flattened tapered tubes extending from the periphery of the drum to the axial cylinder for conducting the heat and products of combustion through the interior thereof, means for rotating the drum and a door for charging and discharging the same substantially as herein shown and described.

2. In a roasting drying or torrefying apparatus a closed drum mounted with capability of revolution, means for heating the same, a closed cylinder arranged axially within the drum, a number of radially-disposed open-ended flattened tapered tubes extending from the periphery of the drum to the axial cylinder for conducting the heat and products of combustion through the interior thereof said tubes being arranged in rows with the tubes of one row intermediate of those of the next row, means for rotating the drum and a door for charging and discharging the same substantially as herein shown and described.

3. In a roasting drying or torrefying apparatus a closed drum mounted with capability of revolution, means for heating the same, a closed cylinder arranged axially within the drum a number of radially-disposed open-ended flattened tapered tubes extending from the periphery of the drum to the axial cylinder for conducting the heat and products of combustion through the interior thereof said tubes being arranged in rows with the tubes of one row intermediate of those of the next row, a row of angularly-disposed deflecting-plates arranged in the place of one row of tubes, means for rotating the drum and a door for charging and discharging the same substantially as herein shown and described.

4. In a roasting drying or torrefying apparatus a closed drum mounted with capability of revolution, means for rotating the drum, a door for charging and discharging the same, a fire consisting of a number of Bunsen burners arranged beneath the drum and carried by a pipe mounted with capability of turning in bearings and at one end closed and at the other end formed as one part of a cock the other part being fixed to the supply-pipe the cock being so constructed that the rotation of the burners in one or the other direction opens or closes the gas-supply, means for turning the burners and a hinged deflecting-plate carried by the burner-pipe for tumbling over the burners in their turned-out position and directing the coffee discharged from the door of the drum into the required channel substantially as herein shown and described.

5. In a roasting drying or torrefying apparatus a closed drum mount-

ed with capability of revolution, means for rotating the drum, a door for charging and discharging the same means for heating the drum, a sampling-door on the periphery of the drum consisting of an eccentrically-mounted disk, a projection adapted to be brought into the path of the disk on one side of the axis of the disk to open it and a fixed projection adapted to engage the disk on the opposite side of said axis to close it and means for receiving the discharged sample substantially as herein shown and described.

6. In a roasting, drying or torrefying apparatus, the combination of a rotating drum, a burner-pipe rotatably mounted beneath the drum, burners upon the burner-pipe, means rotating the burner-pipe to throw the burners away from the drum, and means operated to cover the burner when the burner-pipe is rotated.

697,180. THILL-COUPLES. CHRISTOPHER C. BRADLEY, Syracuse, N. Y. Filed Feb. 2, 1902. Serial No. 22,574. (No model.)

Claim.—1. The combination of an axle, a clip straddling the same, a clip-plate arranged underneath the axle, a spring applied to one of the legs of said clip, screw-nuts applied to said leg above and below said spring, means for preventing the spring from turning on said leg, a coupling composed of a fixed and a movable jaw, and a connection between the spring and the movable jaw, substantially as set forth.

2. The combination of an axle, a clip straddling the same, a clip-plate, a spring applied to the rear leg of the clip and extending forwardly therefrom, screw-nuts applied to the rear leg of the clip above and below said spring, a coupling composed of a fixed and a movable jaw, and a connection between the spring and the movable jaw, substantially as set forth.

3. The combination of an axle, a clip straddling the same, a clip-plate, a spring applied to the rear leg of the clip and extending forwardly therefrom, screw-nuts applied to the rear leg of the clip above and below said spring, the latter being provided at its rear end with a lip projecting on the rear side of the upper nut, a coupling composed of a fixed and a movable jaw, and a connection between the spring and the movable jaw, substantially as set forth.

697,181. BRAN-PACKER. JOHN S. CARRISON, Evansville, Ind., assignor of two-thirds to Lighthouse Brothers, a Corporation of Indiana, and Helms Milling Company, both of Evansville, Ind. Filed Apr. 2, 1901. Serial No. 54,177. (No model.)

Claim.—1. In a packing-machine, the combination of a compressing-box, a trunk or tube suspended by chains or other flexible bands above said box and adapted to enter and be withdrawn therefrom, a plunger supported in position to enter the trunk or tube and means on the plunger to raise the trunk as the plunger descends by acting on its supporting-chains, substantially as set forth.

2. In a packing-machine, the combination of a compressing-box, a trunk or tube supported in position to enter the box, a plunger adapted to enter said trunk or tube and means carried by the plunger for withdrawing the trunk from the compression-box as the plunger moves toward it, substantially as set forth.

3. In combination, a packing-machine, a trunk or tube, chains for supporting the trunk or tube, a plunger adapted to enter and be withdrawn from the trunk or tube and means carried by the plunger for acting on the supporting-chains for raising the trunk as the plunger moves downwardly, substantially as set forth.

4. In a packing-machine, the combination of a trunk or tube for receiving the material to be packed, a compression-box, a receptacle to receive the material to be compressed, a plunger for compressing the material, and means for raising the receiving trunk or tube as the plunger descends to compress the material in the receptacle, substantially as described.

5. In a packing-machine, the combination of a trunk or tube for receiving the material to be packed, a plunger to compress the material, and means for withdrawing said trunk or tube before the plunger has completed its compression-stroke, substantially as described.

6. In a packing-machine, the combination of a trunk or tube for receiving the material to be packed, clamps near the lower end of the trunk for retaining thereon a suitable receptacle for the material, a com-

pressing-box placed to receive the end of the trunk with the receptacle attached, a plunger adapted to enter the trunk and compress the material therein into the sack, and means on the plunger for causing the withdrawal of the trunk from within the sack as the plunger descends, substantially as set forth.

7. In a packing-machine, the combination of a reciprocating trunk or tube for receiving the material to be packed and for temporarily holding a receptacle on its lower end, a compressing-box, a reciprocating plunger adapted to enter the trunk for compressing the material, and means reciprocating transversely to the trunk and plunger for placing a cloth between the plunger and trunk while the plunger is withdrawn from the trunk, whereby the cloth may be carried by the plunger into the receptacle and above the material therein, substantially as set forth.

8. In a packing-machine, in combination with the frame, a trunk or tube, a shaft carrying sprockets journaled to the front of the frame, a similar shaft and sprockets on the rear of frame equal gear-wheels in mesh with one another on the shafts, a chain attached to the trunk or tube on each side and passing over the sprocket-wheels on each shaft, means for rotating the shafts by hand and a friction device for holding the trunk in any position in which it may be placed, substantially as set forth.

9. In a packing-machine, the combination of the frame, a plunger for compressing the material to be packed, a shaft arranged in bearings on its upper end and in sliding boxes on the frame, a pulley fixed to the shaft on each side of the plunger, a shaft at the base of the machine with conical drums fixed thereon, a chain fastened to the top of the plunger for raising it and extending over pulleys down to and around one of the conical drums, and two chains connected to the remaining conical drums for drawing the plunger down and extending upwardly, to and around the pulleys on the shaft journaled on the plunger and an equalizing-bar pivoted to a part of the frame, and to which said chains are attached substantially as set forth.

10. In a packing-machine, the combination of the frame, a plunger for compressing the material supporting a shaft carrying pulleys, a chain attached to the plunger for raising it passing over guide-pulleys to a suitable winding mechanism other chains for drawing down the plunger attached to some fixed portion of the frame and extending upwardly and around the pulleys on said shaft to a winding mechanism, a reciprocating trunk in which said plunger moves, and means actuated from the plunger for elevating the trunk, substantially as set forth.

11. In a packing-machine, the combination of a frame, shafts carrying sprocket-wheels journaled in bearings on the frame, a trunk or tube, chains attached to said trunk or tube and passing over said sprocket-wheels, a plunger, a chain for raising the plunger, a shaft having pulleys journaled to the plunger, chains passing over the pulleys for drawing down the plunger, and means for operating the chains whereby the trunk or tube is raised when the shaft on the plunger is in its descent concentric the chain, substantially as described.

12. A trunk or tube supported by chains, each chain passing over wheels between which is a substantially horizontal stretch of chain in combination with a plunger adapted to be lowered or drawn into the trunk or tube, and means on the plunger for engaging said horizontal stretch of chain as it descends and raising the trunk, substantially as described.

13. The combination of a trunk or tube, chains for supporting the trunk, shafts having sprocket-wheels thereon, each of said chains passing over a sprocket-wheel on each shaft, means for acting on the chain between the sprockets for raising the tube and a friction device for holding said trunk in position when the means for raising it has been removed, substantially as described.

14. The combination of the frame, two horizontal shafts each carrying two sprockets journaled respectively on the front and rear sides of said frame, a trunk or tube intermediate the shafts but below them, chains attached to equalizing-bars on the front and rear of the trunk and passing over a sprocket-wheel on each shaft, and means for pressing down the stretch of chain between the sprockets, substantially as described.

15. The combination of the frame, a shaft carrying chain-wheels journaled one on the front and one on the rear of the machine, a trunk or tube, chains supporting the trunk or tube from the chain-wheels on the shaft, similar gear-wheels on the shafts meshing with each other, a hand-wheel on one shaft for turning the two shafts, and raising or lowering the trunk, and a friction device on either shaft to hold the trunk in any position in which it may be raised or lowered, substantially as described.

16. A compressor-box consisting of hinged leaves adapted to be opened and closed, wedge-blocks on the leaves, a band surrounding the compressor-box and rods attached to the band operated by a hand-lever for raising the band, closing and locking the leaves by forcing said band over the wedge-blocks, substantially as described.

17. A compressor-box consisting of hinged leaves, wedge-blocks on the leaves, a band adapted to be driven over the wedge-blocks for locking the leaves in closed position, and eccentric or cone pivoted to one or more leaves for forcing the band off the wedge-blocks, substantially as described.

18. In a packing-machine, the combination of a reciprocating trunk or tube for receiving the material to be packed, a reciprocating plunger adapted to enter the trunk for packing the same, clamp-carrying bars arranged to slide forward and backward across the machine near the mouth of the trunk or tube, clamps on the bars, means for opening the clamps to receive a piece of fabric, and means for operating the clamp-carrying bars to move the fabric across the trunk when the plunger is withdrawn from the trunk, substantially as described.

19. In a packing-machine, the combination of the frame, a reciprocating trunk or tube therein, clamp-carrying bars arranged to slide forward and backward across the machine on each side of said trunk near its mouth, clamps on the bars, means for opening the clamps at the front of the machine to receive a piece of fabric, means for operating the clamp-bars to draw the fabric across the trunk, a knife for cutting a piece of fabric of suitable size from a roll or strip after the fabric has been drawn across the mouth of the trunk, and means on the rear of the machine for opening the clamps to release the fabric, substantially as described.

20. In a packing machine, the combination of the frame, clamp-carrying bars supported on the frame and arranged to draw a piece of fabric across it, rollers mounted on pivoted arms adapted to press on the edges of the fabric, shoes on the pivoted arms and a pin on the clamp-carrying bar for acting on the shoes and raising the rollers from the fabric, substantially as described.

21. In a packing-machine, the combination of the frame, a shaft journaled therein, winding-drums on the shaft, a plunger, a chain on one drum for raising the plunger, a shaft on the plunger, an equalizing-bar, chains fixed at one end to said equalizing-bar and passing up to and over pulleys on the shaft journaled on the plunger and then down to winding-drums, and means for rotating the shaft in opposite directions, whereby the elevating-chain unwinds from its drum at proportionate speed to the winding of the chains on the other drums and vice versa, substantially as described.

22. In a packing-machine, the combination of a trunk for receiving the material to be packed and supporting on its lower end the receptacle for holding said material, a compressor-box into which the trunk and receptacle may enter, a plunger adapted to enter the trunk, compress the material and withdraw said trunk at the same operation, means for holding the bands with which the package is covered, and means for opening the compressor-box to remove the closed package, substantially as described.

23. The combination in a packing-machine of a compressor-box, a plunger adapted to enter therein, chains attached to cone-pulleys for drawing the plunger into the compressor-box, a chain attached to a cone-pulley for raising the plunger, worm-gearing for operating a shaft carrying the cone-pulleys, a reciprocating trunk into which the plunger enters, and means actuated from the plunger for elevating the trunk, substantially as described.

697,182. ELECTRIC CONTROLLER. FRANK E. CASE, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 16, 1900. Serial No. 28,711. (No model.)

Claim.—1. In combination, in an electric controller provided with a series of movable contacts mounted on a common support and a series of fixed contacts adapted to engage therewith, means for producing a magnetic field in a direction substantially at right angles to the direction of motion of the moving contacts and substantially perpendicular to the face along which contact is made, a blow-out chamber adjacent to each of said fixed contacts, said chamber having an opening adjacent to the contacts for the reception of the arc, and a closed wall opposite to said opening in the direction of travel of the arc.

2. In combination, in an electric controller provided with a series of movable contacts mounted on a common support and a series of fixed contacts adapted to engage therewith, means for producing a magnetic field in a direction substantially at right angles to the direction of motion of the moving contacts and substantially perpendicular to the face along which contact is made, an arcing-chamber including each set of contacts, and a blow-out chamber adjacent to each arcing-chamber, said blow-out chamber communicating with the arcing-chamber through an opening adjacent to the contacts and having a closed wall opposite to said opening.

3. In combination, in an electric controller, a rotatable cylinder provided with contacts, a plurality of fixed contacts adjacent thereto, means for producing a magnetic field in a direction substantially at right angles to the direction of motion of the moving contacts and substantially perpendicular to the face along which contact is made, and a chute structure comprising arcing-chambers including the contacts, and blow-out chambers adjacent thereto, each of said arcing-chambers having portions of the walls cut away to permit the rotation of the contacts and each of the blow-out chambers communicating with an arcing-chamber through an opening adjacent to the contacts and with the atmosphere at a point or points laterally displaced therefrom.

4. In combination, in a cylindrical controller, means for producing a magnetic field in a direction substantially at right angles to the direction of motion of the contacts and substantially perpendicular to the face along which contact is made, and a chute structure comprising blow-out chambers adjacent to each set of contacts, each of said blow-out chambers having an opening adjacent to the controller-contacts and a closed wall opposite thereto in the direction in which the arc tends to travel.

5. In combination in an electric switch, means for producing a magnetic field in a direction substantially at right angles to the direction of motion of the moving contacts, an arcing-chamber including the switch-contacts, and blow-out chambers on each side of said arcing-chamber, said blow-out chambers communicating with the arcing-chamber through openings adjacent to the contacts and having closed walls opposite to said openings in the direction of travel of the arc.

6. In combination in an electric switch, fixed and movable contacts, means for producing a magnetic field in a direction substantially at right angles to the direction of motion of the moving contacts, and blow-out chambers on each side of said contacts, each of said chambers being provided with an opening adjacent to the contacts for the reception of the arc, and having a closed wall opposite to said opening.

697,188. FOLDING LAWN-SWING. DAVID C. GIBBS, Elizabeth, Pa. Filed Oct. 12, 1901. Serial No. 79,190. (No model.)

Claim.—1. A swing comprising a frame having uprights, upper end braces pivotally connected to said uprights, auxiliary braces also pivoted to said uprights and to the ends of said first-named braces, suspending-bars pivotally connected to the opposite side portions of the frame, and swinging means connected to said suspending-bars.

2. A swing comprising a frame having uprights, folding braces connecting the uprights at the upper portion of opposite ends of the frame, jointed suspending-bars at the upper opposite side portions of the frame pivotally connected to the uprights, retaining-braces pivotally attached to the suspending-bars and uprights, and swinging means having levers terminally connected to the outer ends of the suspending-bars.

A swing comprising a frame having uprights, braces pivotally connected to said uprights, auxiliary braces also pivoted to said uprights and to the ends of said first-named braces, and provided with beveled ends adapted to bear on and engage the upper edge portions of the first-named braces, suspending-bars pivotally connected to the opposite side portions of the frame, and swinging means connected to said suspending-bars.

4. A swing comprising a frame having uprights, folding braces in sets at the upper end portions of the frame, jointed suspending-bars pivotally attached to the uprights at points between the points of attachment of said folding braces, and swinging devices attached to the suspending-bars.

5. A swing comprising uprights, the jointed suspending-bars arranged at opposite sides of the swing and composed of sections pivoted between their ends to the uprights and pivotally connected at their inner ends, said sections also having their inner portions interlocked, the braces extending from the uprights to the sections and connected with the latter between the said uprights, and swinging devices suspended from the outer ends of the sections, substantially as described.

6. A swing comprising a frame having uprights, upper end braces pivotally connected to the uprights and crossing each other, the points of crossing of the said braces being secured by pivots, a retaining means applied to the crossed pivoted portions of the said braces, auxiliary braces also pivoted to the uprights and to the upper ends of the first-named braces and having their inner ends angularly formed to bear on the upper edge portions of the latter braces, suspending devices also foldingly constructed and disposed on opposite sides of the frame, and a swinging means attached to said suspending devices.

7. A swing comprising a frame having uprights, folding braces at the upper end portions of the frame, jointed suspending-bars pivotally attached to the upper opposite sides of the frame, the one section of each bar having a stud to removably engage a notch in the other, retaining-braces having their lower ends pivotally attached to the uprights and their upper ends similarly connected to the sections of the suspending-bars on opposite sides of the joint of the latter, the upper portions of the retaining-braces being crossed, and swing means attached to said suspending-bars.

8. A swing comprising uprights, jointed suspending-bars composed of sections pivoted between their ends to the uprights and extending inward and outward therefrom, swing devices suspended from the outer portions of the sections, and braces connecting the inner portions of the sections with the uprights, substantially as described.

697,184. **BUILDING APPARATUS.** CHARLES E. DART, Hopkinton, Mass., assignor to Draper Company, Hopkinton, Mass., a Corporation of Maine. Filed Oct. 17, 1901. Serial No. 73,980. (No model.)

Claim.—1. In a building apparatus, a fixed stripper-plate, a cooperating spirally-threaded pattern, a rotatable and longitudinally-movable carrier therefor having a master-thread of the same pitch, a fixed nut cooperating with the master-thread, fixed bearings located above and below the master-thread and nut, and independent of the stripper-plate to support the carrier laterally and permit longitudinal movement thereof at right angles to the stripper-plate, and means to rotate the carrier, said means including a gear fast on the carrier, cooperation of the master-thread and nut effecting longitudinal movement of the carrier simultaneously with its relative movement, to thereby draw the pattern.

2. In a building apparatus, a fixed stripper-plate, a cooperating spirally-threaded hollow pattern, a rotatable and longitudinally-movable carrier therefor, a fixed tubular bearing for the carrier, to enter and steady the pattern when drawn, a master-thread and a cooperating nut, one being fixedly mounted independent of the stripper-plate, and the other attached to the carrier, to effect longitudinal movement of the latter when rotated, and means to rotate the carrier.

3. In a building apparatus, a fixed stripper-plate, a plurality of like cooperating spirally-threaded hollow patterns, a carrier for each pattern, fixed bearings through which the carriers move and which enter and guide the patterns when drawn, and means to rotate in unison the said carriers and simultaneously move them and their attached patterns longitudinally in correspondence with the pitch of the pattern-threads, to thereby draw the patterns.

4. In a building apparatus, a fixed stripper-plate, having a plurality of openings through said openings, a rotatable and longitudinally-movable carrier for and to which each pattern is secured, a fixed guide-plate having on its upper face tubular bearings through which the carriers freely move, a master-thread on each carrier of the pitch of the pattern-threads, a fixed nut depending from and secured to the guide-plate to cooperate with each master-thread, and means to rotate in unison the carriers, and to move longitudinally with them, longitudinal movement of said carrier being simultaneously effected by the master-threads and nuts, to draw the patterns.

5. In a building apparatus, a fixed stripper-plate, a plurality of like, spirally-threaded patterns to cooperate therewith, a rotatable and longitudinally-movable carrier for each pattern, two fixed bearings for each carrier, one near the pattern, and the other at or near the lower end of the carrier, a master-thread and a cooperating nut for each carrier, one being attached to the carrier and the other fixed, to effect longitudinal movement of the several carriers when rotated, said master-thread and nut being located between the bearings for each carrier, and means to rotate the carriers in unison, said means including a gear fast on each carrier, and a common rotating device in engagement with the several gears.

6. In a building apparatus, a fixed stripper-plate, a cooperating spirally-threaded pattern, a rotatable carrier therefor movable at right angles to the stripper-plate and having an attached sprocket-wheel, a master-thread on the carrier, having the pitch of the pattern-threads, a cooperating fixed nut, a rotatable actuator having an attached sprocket-wheel, a sprocket-chain connecting said sprocket-wheels, and means to move the actuator longitudinally in unison with the carrier, whereby rotation of the actuator will operate the carrier to draw the pattern.

7. In a building apparatus, a fixed stripper-plate, a plurality of rotatable carriers movable at right angles to the stripper-plate and each having an attached sprocket-wheel, a spirally-threaded pattern mounted on each carrier, means to move said carriers longitudinally in correspondence with the pitch of the pattern-threads when rotated, a rotatable and longitudinally-movable actuator having an attached sprocket-wheel, and an endless sprocket-chain connecting said sprocket-wheel with the sprocket-wheels of the several carriers, whereby rotation of the actuator imparts rotation to the carriers, to draw the patterns, the longitudinal movement of the actuator corresponding to the longitudinal movement of the carriers.

697,185. **ANTI-SLIPPING DEVICE.** DAVID M. DRABER, Jackson, Mich., assignor of one-half to Henry W. Scott, Jackson, Mich. Filed Mar. 7, 1901. Serial No. 50,254. (No model.)

Claim.—1. In an anti-slipping device, the combination with a section of a rubber heel, of a cup-shaped disk composed of resilient material, said disk divided by slots or lugs into wings and embedded and retained in said heel, so that the edge of said cup-shaped disk shall project below the surface of said heel, substantially as described.

2. In an anti-slipping device, the combination with a section of a rubber heel and a cup-shaped disk composed of resilient material, said disk divided by slots or lugs into wings, of a base mounted upon said disk and embedded and retained in said heel, so that the edge of said cup-shaped disk shall project below the surface of said heel, substantially as described.

3. In an anti-slipping device, the combination with a rubber heel of a cup-shaped disk composed of resilient material, said disk divided by slots or lugs into wings, and means for retaining said disk when embedded in said heel, so that the edge of said cup-shaped disk shall project below the surface of said heel, substantially as described.

697,186. **STEAM OR FLUID-PRESSURE ENGINE.** WILLIAM J. BENTLEY, Columbus, Ohio. Filed Aug. 19, 1901. Serial No. 79,067. (No model.)

Claim.—In a fluid-pressure engine, a stationary shaft containing longitudinal passages 2' and 3' and an exhaust-port 3' opening on one end of said shaft, cylinders hung to oscillate on said shaft, ports from the passages 2' and 3' for each of said cylinders, a shiftable valve 5 containing a single through-port 5' and a connected double-ported 5', said shiftable valve working on the end of said shaft and adapted to admit live pressure through the port 5' to either of the passages 2' and 3' and exhaust from the other through the valve-port 5' and shaft-port 3', substantially as described.

697,187. **LAWN-RAKE.** WILLIAM L. FENNER, Racine, Wis., assignor to L. E. Baker Manufacturing Company, Racine, Wis. Filed Aug. 16, 1900. Serial No. 58,930. (No model.)

Claim.—1. In a rake, in combination, a rake-head comprising two longitudinal bars, one of which bars has transverse depressions for receiving the rake-teeth; means for securing the bars together; and a rake-tooth for each of said depressions, which tooth has a notch formed in its rear side in which the other of said longitudinal bars of the rake-head is adapted to fit.

2. In a rake, in combination, a rake-head comprising two longitudinal bars, one of which bars has transverse depressions for receiving the rake-teeth; means for securing the bars together; and a rake-tooth of hollow construction for each of said depressions, which tooth is formed from a piece of sheet material bent to provide a convex face and a concave rear side of said tooth, and has notches formed in the edges at its concave rear side in which the other of said longitudinal bars of the rake-head is adapted to fit.

3. In a rake, in combination, a rake-head comprising two longitudinal bars, one of which bars has transverse depressions for receiving the rake-teeth; means for securing the bars together; and a rake tooth of hollow construction, for each of said depressions, which tooth is formed from a piece of sheet material bent to provide a convex face and a concave rear side of said tooth, the rear edges of said tooth being provided

with a projection for being embedded in one of the longitudinal bars of the rake-head.

4. In a rake, in combination, a rake-head comprising two longitudinal bars, one of which bars has transverse depressions for receiving the rake-teeth; means for securing the bars together; and a rake-tooth of hollow construction, for each of said depressions, which tooth is formed from a blank of sheet metal, having two notches cut in its opposite sides, and a projection in each of said notches, which blank is bent to provide a convex face and a concave rear side of said tooth.

5. As a new article of manufacture, a rake-tooth formed from a piece of sheet material bent on a line substantially parallel with the longitudinal axis of the tooth, to form a convex face and a concave rear side of said tooth, and having a notch in the rear side of the tooth near the middle thereof, and a projection in said notch.

6. As a new article of manufacture, a rake-tooth formed from a piece of sheet material bent on a line substantially parallel with the longitudinal axis of the tooth, to form a convex face and a concave rear side of said tooth, and having a squared portion near the middle thereof and notches cut in the edges at its concave rear side, which notches are opposite said squared portion.

7. As a new article of manufacture, a rake-tooth formed from a piece of sheet material bent on a line substantially parallel with the longitudinal axis of the tooth, to form a convex face and a concave rear side of said tooth, and having a portion near its middle of substantially rectangular form.

8. As a new article of manufacture, a rake-tooth formed from a piece of sheet material bent on a line substantially parallel with the longitudinal axis of the tooth, to form a convex face and a concave rear side of the tooth, its middle being substantially of rectangular form, having notches cut from its rear edges at said middle point, one end of said tooth being inclined forward from the line of its longitudinal axis.

9. As a new article of manufacture, a rake-tooth formed from a piece of sheet material bent on a line substantially parallel with the longitudinal axis of the tooth, to form a convex face and a concave rear side of said tooth, one end of said tooth being curved forward from its longitudinal axis, and being provided with a heel at the lower end of said curved portion, and with a rectangular middle portion, said tooth also having a notch in each of its rear edges coinciding with said rectangular portion, and a projection in each of said notches.

697,188. **PROCESS OF TREATING METALLIC SULFIDE.** ADOLPH GUNDEL, Antwerp, and HENRI E. L. FRIEZE, Paris, France. Filed Mar. 26, 1901. Serial No. 59,378. (No specimen.)

Claim.—The process for the conversion of sulfide into sulfates consisting in subjecting them to the action of oxidized air by holding them in suspension in a liquid in the presence of an acid and blowing a current of ozone into the liquid essentially as explained.

697,189. **WINDOW-STOP-ADJUSTING DEVICE.** WILLIAM F. GILBERT, New Britain, Conn., assignor to F. & P. Corbin, New Britain, Conn., a Corporation of Connecticut. Filed Mar. 5, 1901. Serial No. 58,798. (No model.)

Claim.—1. A window-stop-adjusting device comprising a thumb, a crown within said thumb and crown and thumb being integrally

united at the lower portion of said device, an enlarged opening in the top of said crown.

2. A window-stop-adjusting device comprising, a thumb, a crown within said thumb and crown and thumb being integrally united at the lower end of said device, an integral top on said crown, an enlarged opening therein.

3. In a window-stop-adjusting device, a thumb, a crown within said thumb and crown and thumb being integrally united at the lower end of said device the top of said crown being intermediate the length of said device and a slot in the top of said crown.

4. A window-stop-adjusting device comprising, a thumb, an annular flange at the upper edge thereof, a crown within said thumb and crown being united with said thumb at the lower edge of said device, a top on said crown, an elongated opening or slot in said crown.

697,140. **DEVICE FOR COMPENSATING FOR WEAR IN SHOES OF HYDRAULIC BRAKES.** ADOLPH GUNDEL, Paris, France. Filed Dec. 11, 1901. Serial No. 55,909. (No model.)

Claim.—An arrangement for automatically compensating for the wear in the shoes of hydraulic brakes, consisting of a cylinder 2 open at both ends, which is placed in the pipe communicating between the accumulator-reservoir and the brake-cylinder, or which may be formed as an extension upon the rear end of this latter, a movable diaphragm 4 through a central opening in which passes the rod 3 of a spring-valve 5 which normally closes the said opening and which is prolonged to the rear as a screwed rod upon which may be adjusted a regulating-nut 6, and a fixed perforated diaphragm 7, which when the brake is applied serves as a stop for the nut 6 and when the brake is taken off forms a stop for the movable diaphragm, so that the travel of the nut determines the return movement of the brake-piston, while the forward movement of the latter varies according to the state of wear of the brake-shoes, as the device readjusts automatically the required clearance between the brake-shoes and the discs, substantially as described.

697,141. **CASTING-BOX FOR STEREOTYPING.** SAMUEL G. Goss, Chicago, Ill., assignor to the Goss Printing Press Company, Chicago, Ill., a Corporation of Illinois. Filed Dec. 4, 1900. Serial No. 739,190. (No model.)

Claim.—1. In a casting-box, the combination of a case, a core pivoted to said case and adapted to fit thereto, locking mechanism adapted to lock the core in the case, means for throwing the locking device into engagement as soon as the core is brought to operative position in the case, core-lifting device, and gearing which operates to unlock the case when said lifting device are actuated to lift the core out of the case, substantially as described.

2. In a casting-box, the combination of a case, a core pivoted to said case and adapted to fit thereto, locking mechanism adapted to lock the core in the case, means for throwing the locking device into engagement as soon as the core is brought to operative position in the case, core-lifting device carried by the case, and gearing which operates to unlock the

core when said lifting device are actuated to lift the core out of the case, substantially as described.

3. In a casting-box, the combination of a case, a core pivoted to said case and adapted to fit therein, cam mechanism mounted on said core and adapted to engage said case for lifting the core out of the case, locking devices adapted to secure the core in the case, means for throwing the locking devices into engagement as soon as the core is brought to operative position in the case, and gearing actuated by the operation of said lifting mechanism for unlocking the core from the case, substantially as described.

4. In a casting-box, the combination of a pivoted-mounted case, a core pivoted to said case and adapted to fit therein, locking devices adapted to lock the core in the case, means acting independently of the movement of the case for throwing the locking devices into engagement as soon as the core is brought to operative position in the case, lifting devices carried by the core and adapted to engage the case for lifting the core out of the case, and gearing actuated by the operation of said lifting devices for unlocking said core, substantially as described.

5. In a casting-box, the combination of a case, a core pivoted thereto at one end and adapted to fit in said case, transverse shafts carried by said core, cams carried by one of said shafts and operating to raise the core out of the case, lugs carried by the other of said shafts, locking devices carried by the case and acting to engage said lugs to lock the core in the case, means connecting said shafts so that they will rotate simultaneously, and a lever for rotating said shafts, substantially as described.

6. In a casting-box, the combination with a case, of a core pivoted at one end and adapted to be fitted in said case, parallel transverse shafts carried by said core, cams carried by one of said shafts for raising the core out of the case, lugs carried by the other of said shafts, locking devices carried by the case and adapted to engage said lugs to lock the core in the case, means connecting said shafts whereby they will rotate simultaneously, and a lever for rotating said shafts, substantially as described.

7. In a casting-box, the combination with a case, of a core pivoted at one end and adapted to be fitted in said case, parallel transverse shafts carried by said core, cams carried by one of said shafts for raising the core out of the case, lugs carried by the other of said shafts, locking devices carried by the case and adapted to engage said lugs to lock the core in the case, and intermeshing gears carried by said shafts for rotating them simultaneously in opposite directions, substantially as described.

8. In a casting-box, the combination with a case, of a core pivoted at one end and adapted to be fitted in said case, parallel transverse shafts carried by said core, cams carried by one of said shafts for raising the core out of the case, segmental lugs carried by the other of said shafts, spring-latches carried by the case and adapted to engage said lugs to lock the core in the case, means connecting said shafts whereby they will rotate simultaneously, and a lever for rotating said shafts, substantially as described.

9. In a casting-box, the combination of a pivoted-mounted case, a core pivoted thereto at one end and adapted to fit therein, movable lugs carried by said core at opposite sides thereof, spring-latches carried by said case and adapted to engage said lugs to lock the core in the case, and means for moving said lugs out of engagement with said spring-latches to release the core from the case, substantially as described.

697,142. BUNDLE-CARRIER FOR HARVESTERS. HENRY GARR, Peoria, Ill., assignor to the Acme Harvester Company, Peoria, Ill., a Corporation of Illinois. Filed Apr. 26, 1901. Serial No. 57,572. (No model.)

Claim.—1. In a bundle-carrier for harvesters the combination with a rocking time-supporting bar, times pivotally mounted thereon, and adapted to fold substantially in line therewith, a time-folding bar, a pivoted lever, a connection between said lever and the time-supporting bar, and a flexible connection between the lever and the time-folding bar, and means for rocking said lever on its pivot whereby the time-supporting bar is rocked to lower the outer ends of the times into contact with the stubble before the folding of the times begins, substantially as described.

2. In a bundle-carrier the combination with a rocking time-supporting bar, times pivotally mounted thereon and adapted to be folded substantially in line therewith, a time-folding bar having crank connection with the several times, a pivoted bell-crank, a link pivotally connecting one arm of the bell-crank with the time-supporting bar, and a flexible connection between the other arm of the bell-crank and the time-folding bar, a crank-arm connected to the time-folding bar, and a spring connected to said crank-arm and tending to fold the times at the conclusion of the rocking movement of the time-supporting bar, substantially as described.

3. In a bundle-carrier the combination with a rocking time-supporting bar, of times pivotally mounted thereon and adapted to fold substantially in line therewith, crank-arms connected with said times, a time-fold-

ing bar connecting the several time-cranks, a bell-crank lever, a pivoted link connecting one arm of said lever and the time-supporting bar, and a flexible connection between the other arm of the bell-crank and the time-folding bar, means for rocking said lever upon its pivot, and the pivoted connections of the link being so disposed that the end thereof which is connected to the bell-crank is carried beyond a plane passing through the axis of the bell-crank and the point of connection to the time-folding bar when the times are extended, whereby to provide a lock, substantially as described.

4. In a bundle-carrier for self-binding harvesters, the combination with a supporting-frame, of a time-supporting bar mounted to rock upon said frame, times pivotally upon said bar and having cranks, a time-folding bar connecting the several cranks, a bell-crank lever pivoted to rock about the axis of one of the times and having one of its arms connected to the time-folding bar, a spring having one end connected at a fixed point and the other connected to one arm of the bell-crank, and the pivoted connections being so disposed that in folding the times one end of the spring is carried beyond a line passing through its fixed point of connection and the axis of the bell-crank, substantially as described.

5. In a bundle-carrier the combination with a rocking time-supporting bar and folding times carried thereby, of means for rocking the supporting-bar and shifting the folding-bar, said means comprising a bell-crank having arms extended from its pivot, one toward and the other away from the carrier, a link connecting the outer end of the arm extending away from the pivot with the time-supporting bar, and an adjustable stop for regulating the movement of said link, substantially as described.

697,143. FLUID POWER-TRANSMISSION MECHANISM. JOHN HARRIS, JR., Chicago, Ill. Filed May 2, 1901. Serial No. 59,601. (No model.)

Claim.—1. In fluid-transmission mechanism, the combination of a fluid-circulating device, a fluid-actuated motor, an interposed reversing-valve, a by-pass through which the fluid may pass idly, a speed-controlling valve at said by-pass, and interlocking means for said valves, substantially as and for the purpose set forth.

2. In fluid-transmission mechanism, the combination of a fluid-circulating device provided with a by-pass through which the fluid may pass idly, a speed-controlling valve at said by-pass, a reversing-valve, a fluid-actuated motor, fluid-passages connecting said fluid-circulating device, said valves and said motor, actuating-arms for said valves, and interlocking heads on said stems, the head on said reversing-valve stem being provided with two recesses corresponding to the direct and reverse position of said valve, and the head on said speed-controlling valve-stem being provided with a projection for entering either one of said recesses, according to the position of the reversing-valve, substantially as described.

3. In fluid-transmission mechanism, the combination of a fluid-circulating device, a fluid-actuated motor, an interposed reversing-valve, a speed-controlling by-pass valve, a head on the stem of said reversing-valve provided with recesses corresponding to the direct and reverse positions of the said valve, and an interlocking head on the stem of said speed-controlling valve, provided with a curved projection having its con-

ter of curvature lying in the axis of said last-named valve, said speed-controlling valve being disposed to close said by-pass when said heads are completely interlocked and to open said by-pass when said heads are disengaged from each other, substantially as described.

4. In fluid-transmission mechanism, the combination of a fluid-circulating pump provided with a by-pass, a fluid-actuated motor, an interposed reversing-valve, provided with an actuating-stem, a disk on said stem provided with a flange having recesses corresponding to the direct and reverse positions of said valve, a speed-controlling by-pass valve interposed between said pump and said reversing-valve and provided with an actuating-stem, and an actuating-arm for said stem provided with a curved projection to engage said flange or to enter one of said recesses, according to the position of the reversing-valve, said speed-controlling valve being disposed to close said by-pass when the parts are interlocked and to open the same when the parts are disengaged, substantially as described.

697,144. CIRCUIT-CONTROLLER. EDWARD E. HEWLEY, Rahway, N. J., assignor to General Electric Company, a Corporation of New York. Filed Sept. 9, 1901. Serial No. 74,713. (No model.)

Claim.—1. The combination with a circuit-breaker, of an electro-responsive device controlling the same responsive to different line conditions, connections for actuating the circuit-breaker under one line condition, and a signal operated by another line condition.

2. The combination with an automatic circuit-breaker, of tripping mechanism for operating the same upon a maximum overload, and a signal operated thereby upon a determinate load less than the maximum.

3. The combination with a circuit-breaker, of an electromagneto device for tripping the same, means for increasing the retractile force of the armature of said device after a determinate range of movement, and an auxiliary circuit controlled during each range of movement.

4. A circuit-controller comprising a magnet, a local circuit actuated by a determinate range of armature movement, a retractile force put in action after each range of movement, and another local circuit closed by a further range of armature movement.

5. A circuit-controller comprising an operating-coil, a movable core, a signal-circuit closed by a determinate range of core movement, a retractile spring normally disengaged but engaged by the core after a determinate range of movement, and a tripping-circuit for a circuit-breaker actuated by a further range of armature movement.

6. A circuit-controller comprising an operating-coil, a movable core, a slotted supporting-tube in alignment with the coil-axis, and a retractile agent engaged by an extension of the core through the slot.

7. A circuit-controller comprising an operating-coil, a movable core, a slotted supporting-tube in alignment with the coil-axis, an extension of

the core projecting through the slot, and a retractile agent engaged by the extension after a determinate range of core movement.

8. A circuit-controller comprising an operating-coil, a movable core, a tripping device operated by a full range of core movement, and a spring-depressed circuit-closer normally engaged by the core and released by a partial range of core movement.

9. A circuit-controller comprising an operating-coil, a movable core, an insulating tube for the latter in alignment with the coil-axis, a stop supporting the core within the grasp of the coil, a trip device for a circuit-breaker movably supported at the top of the coil, insulated-contacts for a local circuit on the bottom of the tube, and a spring-pressed bridge-piece to connect the contacts after the core has made a partial traverse.

10. The combination with a circuit-breaker, of an electro-responsive device controlling the same provided with differential coils, an indicator controlled by the coils upon a determinate strength of current-reversal, and means for tripping the circuit-breaker upon a determinate excess of current in either coil.

697,145. DASH-POT. WILLIAM A. NETTLE, Philadelphia, Pa., assignor to Edwin A. Moore, Philadelphia, Pa. Filed Sept. 24, 1901. Serial No. 75,354. (No model.)

Claim.—1. A dash-pot having a piston connected with a valve, a valve-actuating mechanism for moving the valve and the piston in one direction, means for applying a constant pressure to return the piston, and means for producing variable resistance to the return stroke of the piston.

2. A dash-pot having a piston, in combination with means for applying a constant pressure to one side of the piston, and means for producing variable resistance on the opposite side thereof.

3. A dash-pot having a cylinder provided with an opening in the wall thereof, and a revolvable jacket having an opening therein registering with the opening in the wall of the cylinder; in combination with a piston.

4. A dash-pot having a cylinder provided with a longitudinal slot in the wall thereof, and a revolvable jacket having an opening therein registering with said slot; in combination with a piston having a feather-key therein engaging said slot.

5. A dash-pot cylinder having longitudinal slots in the wall of the cylinder, and a revolvable jacket having openings therein registering with said slots; in combination with a piston having keys therein engaging said slots.

6. A dash-pot cylinder having longitudinal slots in the wall thereof the length of the travel of the piston, and a reversible jacket having a graduated opening registering with said slots; in combination with a piston having boys engaging the slots.

7. A dash-pot cylinder provided with a piston, and having induction-ports and valves in one head thereof, and an ejection-passage in the wall of the cylinder; in combination with means for regulating the discharge from the cylinder and producing variable resistance to the piston during its outstroke.

8. A dash-pot cylinder having a chamber at one end, means for supplying fluid to said chamber at a constant high pressure, and means for producing variable resistance in the dash-pot cylinder; in combination with a piston subject to said pressure and said resistance.

9. A pair of dash-pots adjacent and connected by the heads thereof, and a fluid-pressure chamber in the neck between the heads; in combination with a piston in each pot having a rod extending into said chamber.

697,146. TRIPOD OR STAND. CLARENCE W. HOWARD, Kirkwood, Ill. Filed Mar. 29, 1901. Serial No. 93,398. (No model.)

Claim.—1. A tripod or stand which consists of a head, legs, and means connecting the legs to the head consisting of spring members at the upper ends of the legs adapted to be sprung or bent inwardly to close the legs, and outwardly to spread the legs.

2. In a tripod or stand which consists of a head carrying a support for a photographic camera or other instrument, legs, and an additional support for said instrument, consisting of a rod adapted to be detachably secured at its upper end to said instrument, a clamping-sleeve secured to the lower end of said rod, and engaging one of the legs of the tripod, and a cam-lever pivoted to said sleeve and adapted to hold the same against movement.

3. In a tripod or stand which consists of a head carrying a support for a photographic camera or other instrument, legs, and an additional support for said instrument, consisting of a rod, a pin pivoted to the upper end of said rod, a sleeve removably holding said pin, and suitable means for securing said sleeve to the instrument; the lower end of said rod being secured to one of the legs of the tripod.

4. In a tripod or stand which consists of a head carrying a support for a photographic camera or other instrument, legs, and an additional support for said instrument, consisting of a rod, a pin pivoted to the upper end of said rod, a sleeve removably holding said pin, and suitable means for securing said sleeve to the instrument; a clamping-sleeve secured to the lower end of said rod, and engaging one of the legs of the tripod, and a cam-lever pivoted to said clamping-sleeve and adapted to hold the same against movement.

697,147. TRIPOD OR STAND. CLARENCE W. HOWARD, Kirkwood, Ill. Filed Aug. 9, 1901. Serial No. 71,698. (No model.)

Claim.—1. A tripod or stand consisting of a head, legs, and a device for bracing the legs when spread which consists of a rod or arm pivoted at one end to one of the legs and provided at its other end with a ring or sleeve loosely encircling one of the other legs and adapted to slide up and down thereon.

2. A tripod or stand consisting of a head, legs, and a device for bracing the legs when spread, which comprises a loose sleeve adapted to slide up and down on one of the legs, and a rod or arm pivoted at one end to said sleeve and at its other end to one of the other legs.

3. A tripod or stand consisting of a head, legs, and a device for bracing the legs when spread, which comprises a loose sleeve adapted to slide up and down on one of the legs, and rods or arms each pivoted at one end to the sleeve, one of the rods or arms pivoted at its other end to a second leg of the tripod, and the other arm or rod pivoted at its other end to the third leg of the tripod.

4. A tripod or stand consisting of a head, legs, and a device for bracing the legs when spread, which comprises a loose sleeve adapted to slide up and down on one of the legs, and rods or arms each pivoted at one end to the sleeve, one of the arms or rods pivoted at its other end to a second leg of the tripod and the other arm or rod pivoted at its other end to the third leg of the tripod, and also a rod or arm pivoted at each end to the second and third legs of the tripod, and having a hinge in its middle.

5. A tripod or stand comprising a head; legs G, H, I; the leg I having the extension rod or member U telescoped in said leg I and slidable longitudinally therein; and on said extension-rod near its lower end a member comprising the rings S and T, said rings adapted to tightly enclose or enclose the lower ends of the other legs G, H, when the legs are folded together and said extension-rod is pushed in, and adapted to release said legs G, H, when said extension-rod is drawn outward, substantially as and for the purpose described.

697,148. COIN-FREED APPARATUS FOR DELIVERING SWEETS OR OTHER ARTICLES. EDWARD A. JEFFREY, Mosley England. Filed Nov. 28, 1901. Serial No. 93,571. (No model.)

Claim.—1. In a coin-free article-delivery machine, the combination with a receptacle for holding a plurality of small articles, of a spoon for dipping up and removing a quantity of such articles, and coin-controlled mechanism for governing the action of said spoon, and means whereby universal movement may be imparted to said spoon for removing articles from any part of the receptacle, substantially as described.

2. In a coin-free article-delivery machine, the combination with a receptacle for holding a plurality of small articles in loose form, a cover for said receptacle, a horizontal operating-shaft, a spoon within the receptacle having a handle extending through the cover, a rocking connection between the spoon-handle and shaft, and coin-controlled means for governing the motion of said shaft, substantially as described.

697,149. SHIP'S ANCHOR. FRANK W. KENNEY, Providence, R.I. Filed Aug. 8, 1901. Serial No. 71,361. (No model.)

Claim.—1. The combination with an anchor-shank having a hook

casing provided with keyholes, of a stock having graduated wards and capable of movement longitudinally through said keyholes, a stop arranged within the path of rotary movement of one of said wards to limit the rotary movement of said stock in one direction, and a locking device adapted to engage one of the other wards and prevent its rotation in an opposite direction, substantially as set forth.

2. The combination with an anchor-shank provided with a lock-casing having aligning keyholes and an internal stop, of a stock provided with graduated wards and capable of sliding through said keyholes, two of said wards being located on the outer side of said lock-casing and one within said lock-casing, which latter one is adapted to engage the stock within the said casing and thereby limit the rotation in one direction of the stock, and a crank-lever journaled in bearings and provided with a toe adapted to engage one of the outer wards and prevent rotation of said stock in an opposite direction, said lever with its free end engaging said shank, substantially as set forth.

697,150. SHINE-PURRING MACHINE. WILLIAM R. LANTZ, Gloucester, Mass. Filed Dec. 26, 1900. Serial No. 41,004. (No model.)

Claim.—1. A double speed shine-purring machine, comprising in its construction a suitable frame, a shaft mounted in said frame, independently-operable wheels or drums mounted on said shaft, each wheel or drum having a deep substantially U-shaped rope-gripping groove which tapers slightly outward from the bottom to the top thereof, clearers for removing the rope from the grooves, the construction and arrangement being such that when the ends of the pure-line attached to a shine have been entered into the grooves of the wheels or drums, and said wheels or drums rotated, the rope will be gripped and held firmly in the bottom of the grooves without any auxiliary gripping means until it is removed by the clearers, substantially as described.

2. A double speed shine-purring machine comprising a suitable frame, a two-part shaft mounted in said frame, wheels or drums mounted on the two parts of said shaft, each wheel or drum having a groove, a crank-handle on each shaft, the grooves being of such shape and construction as to grip the ends of the pure-line, and draw in the same without auxiliary gripping means, and clearers for automatically removing the rope from the grooves, the construction also being such that one wheel or drum may be operated independently of or simultaneously with the other, substantially as described.

697,151. SHINE-PURRING MACHINE. WILLIAM R. LANTZ, Gloucester, Mass. Filed Dec. 26, 1900. Serial No. 41,005. (No model.)

Claim.—1. A shine-purring mechanism comprising a boat, supports in said boat arranged at a distance from each other, a pure-line threaded through a shine, each end of the said line entering the boat, a pure-line-handling mechanism engaging each end of the pure-line and located upon each of the said supports so that they may be conveniently operated without interfering with each other, and means for drawing the pure-lines close together where they pass over the edge of the boat, the said lines separating again within the boat and passing to the pure-line-handling mechanisms, substantially as described.

2. A mechanism for handling and passing a shine, comprising a boat, seats secured in the boat at suitable distances from each other, a winding-drum on each seat, mechanism for operating the said drums, a pure-line threaded through the shine and having its ends brought over the side of the boat, one being secured to each of said winding-drums, and means for mounting the pure-lines at a proper distance from each other as they pass over the edge of the boat, the structure being such that two gangs of men can be used in passing the shine without interfering with each other, substantially as described.

3. A shine-purring mechanism, comprising a boat, seats in said boat, a line-handling mechanism mounted on each seat, comprising a drum, a shaft for turning the same, a ratchet for preventing a reverse movement of the drum, means for holding the pure-lines in engagement with the peripheries of the drums so that the said lines will not become tangled or disengaged from the drums, a pure-line threaded through the shine and having its ends projecting into the boat, one end being secured to one drum, the other end to the other drum, a block-supporting frame in the said boat, pulleys carried by the said frame for drawing the pure-lines comparatively close together as they pass over the said boat and then permitting them to separate again and pass to each of said drums, the structure being such that separate gangs of men can be employed for drawing in the end of the pure-lines, the said gangs working in unison when desired or alternately, according as one side or the other of the shine needs to be passed, substantially as described.

697,152. CHURN. FREDERICK W. LIPPOLD, Louisville, Ky., assignor, by mesne assignments, of one-half to T. J. Landrum, Louisville, Ky. Filed June 20, 1901. Serial No. 60,212. (No model.)

Claim.—1. In a churn, the combination with a dasher-rod, and means for rotating the same, of a disk having a central hub with a transversely-elongated opening therethrough, and set-screws for securing the disk to the dasher-rod, by which said disk is disposed at an angle with respect to the rod, substantially as shown and described.

2. In a churn, the combination with the usual and rotary dasher-rod located therein, of a standard having a reduced upper end, a frame supported by the standard and having a socket to receive said reduced end, bearings in the frame for the driving-shaft, a vertical member on said

frame having a reduced upper end, and a casting slidable upon the reduced end of said vertical member and secured thereto by a set-screw, said casting forming a bearing for the upper end of the dasher-rod, together with a large gear-wheel on the driving-shaft having two sets of teeth, a pinion slidable upon the dasher-rod and a set-screw for holding the pinion in an adjusted position, substantially as shown and described.

697,158. VARIABLE-SPEED GEAR FOR MOTOR VEHICLES, CYCLES, OR THE LIKE. JAMES R. MADAY, Salisbury, England. Original application filed July 14, 1900, Serial No. 22,612. Divided and this application filed Mar. 15, 1901. Serial No. 51,338. (No model.)

Claim.—1. The improved variable-speed and reversing gear comprising the combination with the axle of two toothed rings oppositely-acting one-direction clutch mechanisms, connecting said rings and axle, a gear-wheel disposed between the toothed rings one-direction clutch mechanism between said gear-wheel and axle, a set of independent double spur-wheels on one side of the gear-wheel gearing with the said toothed ring on that side and an internally-toothed rim on the gear-wheel and another set of independent double spur-wheels on the other side of the gear-wheel gearing with the toothed ring on that side and an externally-toothed rim on the gear-wheel and means for entirely disengaging the clutch between the main gear-wheel and the axle, all substantially as set forth.

2. The improved variable-speed gear comprising the combination with an axle of a gear-wheel, two collars fixed to the axle on either side of said gear-wheel, one-direction clutch mechanism between said gear-wheel and one of the collars, means for withdrawing the clutch between the collar and gear-wheel so as to allow the latter to run free in both directions, a toothed rim on one side of the gear-wheel and a toothed rim on the other side of the gear-wheel, two sets of double spur-wheels, one on each side of said gear-wheel, the inner halves gearing respectively with the said toothed rims thereon, toothed rings disposed upon the fixed collars at each side of the gear-wheel and gearing with the outer halves of the said double spur-wheels suitable one-direction clutch mechanism between each toothed ring and its collar, the clutch mechanism on one side driving in the opposite direction to that on the other, and means for holding and releasing the side plates which carry the double spur-wheels when it is required to vary the gear all substantially as and for the purposes set forth.

3. The improved variable-speed gear comprising the combination with shaft M, collars NX and NY, toothed rings B and C and gear-wheel A having toothed rims a' a' of double spur-wheels OX OY, axles RX RY respectively for said double spur-wheels, plates respectively X' X' and Y' Y', supporting said axles RX RY, intermediate plates X' X' and Y' Y' having apertures a', studs ry connecting plates X' X' and Y' Y' between the double spur-wheels, the band brake plates supported by said plates X' X' and Y' Y' and the brake-bands engaging said brake-band plates for locking and unlocking same, all substantially as set forth.

697,154. STRAINER. EDWARD L. MASON, Ipswich, Mass. Filed Jan. 22, 1900. Serial No. 90,757. (No model.)

Claim.—1. A strainer composed of a body having an inlet end and a connected neck portion, and a screen removably seated within said body and comprising an upper and a lower ring, each containing a piece of reticulated material and rods connecting the rings, said body having provisions for engaging the said upper and lower rings for sustaining the screen therein.

2. A strainer comprising a conically-shaped body portion flanged near its larger end and having a neck connected to its opposite end, a screen comprising a plurality of rings spaced apart, each ring being provided with a reticulated fabric, rods connecting said rings, the upper and lower rings adapted to be seated upon the flanged portion and connected neck respectively to sustain the screen in position within the conical body.

697,155. NAILLESS HORSESHOE. JAMES W. HONER, Barron, Wis. Filed May 11, 1901. Serial No. 59,770. (No model.)

Claim.—1. A horseshoe formed with a rigid body-section extending from end to end thereof, and provided with a segmental clamping-flange having a pivoted section, and a detent for locking said pivoted flanged section directly to the body of said shoe, substantially as described.

2. A horseshoe, provided on its upper face with a segmental clamping-flange having a pivoted section, and a spring pawl-and-ratchet device for locking said pivoted flanged section in its closed position, substantially as described.

3. A horseshoe, provided on its upper face with a clamping-flange having a pivoted section, ratchet-teeth at the free end of said pivoted flange-section, a cooperating spring-detent on said shoe, and a dovetailed connection between said shoe and the intermediate portion of said pivoted flange-section, substantially as described.

4. A horseshoe, having a rigid body portion extending from end to end thereof provided on its upper face with the clamping-flange 2 and the pivoted flange-section 4, which clamping-flange is provided with teeth or teeth 12, and means for securing said pivoted flanged section in its closed position, substantially as described.

5. The combination with a horseshoe, of the clamping-flange 2 rigidly secured to the upper face thereof, the pivoted clamping-section 4 pivoted thereto at 8, and provided with the ratchet-teeth 8 and dovetailed ribs 6, which seats 6 work in dovetailed grooves 7 of said shoe, and the spring-detent 11 on said shoe provided with teeth 10 for engagement with the said ratchet-teeth 8, substantially as described.

697,156. COMBINED LOCK AND LATCH. LEVIN E. BULLOCK, Trappe, Md. Filed Aug. 27, 1901. Serial No. 73,672. (No model.)

Claim.—1. A combined lock and latch, comprising a latch having

an open middle portion, means for retracting and projecting the latch, a rotary key-operated locking-disk underlying the middle opening portion of the latch and provided with a raised rib or projection adapted upon the rotation of said disk to rest against the forward end of said open portion of the latch and prevent its retraction, and said disk having notches at opposite points in its periphery, one wall of each notch being beveled or rounded and the other being abrupt to form a shoulder to prevent further rotation of the disk, a retaining-dog comprising a spring-pressed apertured plate provided with a toe or lug to snap into and be forced out of said peripheral notches by the inclined walls thereof upon the rotation of the locking-disk, substantially as set forth.

2. A combined lock and latch, consisting in the divided cylindrical casing having recesses in its inner walls near its forward end, keyholes in rear thereof, bearings at the inner sides of the casing intersected by said keyholes and bearings at its rear end, a latch mounted in said casing and having a middle open portion, a forward shank and a yoke at its rear end, a knob-spring above mounted in the rear bearings to retract the latch, a spring on the shank to project the latch, a locking-disk having hubs turning in the middle bearings, a keyhole extending through the disk and its hubs to register with the casing-keyholes, and peripheral notches in its periphery and on a line at right angles to its keyhole, one wall of each notch being rounded or beveled and the other abrupt to form a shoulder to prevent further rotation of the disk, and a retaining-dog for the disk, comprising an apertured plate mounted on the shank in rear of the spring with its side edges in the forward recesses of the casing and provided with a toe or lug to snap into and be forced out of the said notches by the beveled walls thereof upon the rotation of the disk; and also having upper and lower guide-arms engaging the upper and lower walls of the lock-casing; substantially as described.

697,157. ELECTROLYTIC APPARATUS. FRANK McDONALD, Rumford Falls, Me. Filed May 20, 1901. Serial No. 61,116. (No model.)

Claim.—1. In an electrolytic apparatus, the combination of a metallic tank, spaced perforated metallic plates electrically connected with the tank and subdividing the tank to form anode and cathode compartments, asbestos diaphragms lining said plates, a layer of acid-proof cement covering the inner surface of the bottom and end walls of the tank between the diaphragms, a cover hermetically sealing the anode compartment, a cover sealing the cathode-compartment, positive electrodes carried by the cover to the anode-compartment, and negative connections to the plate and the tank, substantially as described.

2. In an electrolytic apparatus, the combination of a tank, the end walls of which are provided with recesses in their upper edges, spaced perforated plates subdividing the tank to form anode and cathode compartments and having their upper edges outwardly curved to form seats cooperating with said recesses, asbestos diaphragms lining the perforated plates, a cover in the anode-compartment supported by said plates and fitting down in the seat formed by said outwardly-curved edges of the plates and the recessed end walls of the tank, a filling of cement hermetically sealing said seat around the cover, positive electrodes carried by said cover, negative connections to the plate and tank and a cover sealing the cathode-compartment, substantially as described.

3. In an electrolytic apparatus, the combination of a tank, spaced perforated plates subdividing the interior of the tank into anode and cathode compartments, the end walls of the tank being recessed and the upper edges of the plates outwardly curved to form a groove or seat, asbestos diaphragms lining the perforated plates, a cover closing the anode-compartment and resting upon said plates within said seat, sealing material inserted within the seat around the cover and hermetically closing

the joints between said cover and plates and the end walls of the tank, positive electrodes carried by said cover, negative connections to the plate and tank, a second cover closing the cathode-compartment, a layer of acid-proof cement lining the bottom and end walls of the tank and covering the space between the edges of the asbestos diaphragms, chlorine and hydrogen pipes connected, respectively, with the anode and cathode compartments, overflow-pipes connected with the cathode-compartment, a feed-pipe connected with the anode-compartment, a gage also connected with said compartment for indicating the level of the fluid therein, a valve in the feed-pipe, a vessel communicating with the anode-compartment and a float in said vessel and connected with said valve, substantially as described.

697,158. ELECTRIC-CIRCUIT-REGULATING DEVICE. GEORGE P. McFARLAND, St. Louis, Mo., assignor of forty-nine one-hundredths to Oscar R. Fleckman and Richard F. Spencer, St. Louis, Mo. Filed Oct. 22, 1901. Serial No. 60,178. (No model.)

Claim.—1. In an apparatus of the character described, the combination with a constantly-rotating circuit-interrupter whose face is composed of insulation material and contact-making segments alternately arranged and formed tapering, said contact-making surfaces being connected to a source of supply, a brush cooperating with said segments for conducting off the derived current, means for adjusting the position of said brush with respect to said segments, whereby, the period of contact of the brush with the segments may be regulated, and yielding means for returning said brush to normal position out of contact with the live segments; substantially as described.

2. In an apparatus of the character described, the combination with a constantly-rotating circuit-interrupter in the form of a disk having tapered contact faces or segments, tapered insulation material between said contact-faces, a brush contacting with the side face of said disk, means for adjusting said brush toward and from the axis of rotation of said disk, and a spring for returning said brush to its normal position adjacent the center of said disk; substantially as described.

3. In an apparatus of the character described, the combination with a plurality of circuit-interrupting disks mounted on a common shaft and electrically connected therewith, each of said disks consisting of contact-strips and insulation between said contact-strips, brushes cooperating with said contact-strips, and means for adjusting said brushes toward and from the axis of rotation of said disks; substantially as described.

4. In an apparatus of the character described, the combination with a plurality of circuit-interrupting disks whose strips are electrically connected, of means for rotating said disks, brushes cooperating with said disks, and means for simultaneously adjusting said brushes toward and from the axis of rotation of their respective disks; substantially as described.

5. In an apparatus of the character described, the combination with a motor and its shaft, of a plurality of circuit-interrupting disks mounted on said shaft and rotating therewith, each disk having an insulation-ring in its center, and contact-strips radiating from said insulation-ring, sliding bars carrying brushes designed to contact with said radiating strips, and means for moving all of said bars simultaneously so that said brushes are adjusted toward and from the axis of rotation of the disks; substantially as described.

6. In an apparatus of the character described, the combination with an interrupting-disk containing an insulation-ring and conducting-strips, of a brush adapted to rest wholly upon said insulation-ring, means for moving said brush off of said insulation-ring and into contact with said strips, and a spring for returning said brush onto said insulation-ring; substantially as described.

7. In an apparatus of the character described, the combination with an interrupting-disk provided with a continuous contact-ring and a continuous insulation ring, oppositely-tapered contact and insulation strips between said continuous rings, a motor for rotating said disk, a brush, and means for moving said brush across the face of the disk from the insulation-ring in the continuous contact-ring and vice versa; substantially as described.

8. In an apparatus of the character described, the combination with a circuit-interrupter composed of a series of tapered contact-strips electrically connected together and with a source of supply, a continuous contact-ring adjacent to and connected with said strips, tapered insulation or

ranged between said contact-strips, a continuous insulation-ring adjacent said tapered strips of insulation, means constantly rotating said circuit-interrupter at a high speed, a brush designed to electrically contact with said tapered strips, and means for moving said brush over the face of said circuit-interrupter, whereby, the duration of contact between the brush and a conducting-strip may be controlled; substantially as described.

697,159. FLOOD-GATE. JOHN E. OULX, Windfall, Ind. Filed May 24, 1901. Serial No. 61,744. (No model.)

Claim.—1. The combination with cable-supporting posts, of a main cable secured thereto, an auxiliary cable connected to said supporting-posts, gates having supporting means suspended on the main cable, and means for twisting together the main and auxiliary cables at their middle portions, said means connecting said cables, as set forth.

2. The combination with the cable-supporting posts, of a main cable connected at its ends to said posts, an auxiliary cable also connected to said posts, gates suspended from the main cable, a tubular section through which the main cable passes, an extension on said tubular section through which the auxiliary cable passes, and a handle portion with stem and controlling-handle, said handle being adapted to be turned to twist together the cables, substantially as described.

697,160. WATER-COOLING TOWER. WILLIAM OETENDORFF, Union Hill, N. J. Filed Oct. 7, 1901. Serial No. 77,733. (No model.)

Claim.—The combination, with the supporting-framework of a water-cooling apparatus, of a plurality of spraying-pans arranged one above the other, and supported by said framework, each pan having its bottom provided on the under side with doubled portions forming inclined deflecting-flanges integral therewith, and also provided with perforations through said bottoms above the upper sides of said deflecting-flanges, and with wooden strips reinforcing the upper edges of said pans, and guard-nettings in the spaces between said pans and attached thereto by fastenings driven into said wooden reinforcing-strips, substantially as described.

697,161. CONTROLLING ELECTRIC LAMPS. EUSTACE OXLEY, Brooklyn, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Aug. 20, 1900. Serial No. 28,007. (No model.)

Claim.—1. An electric circuit containing a plurality of translating devices, and means controlled by current flowing through said translating devices for cutting out or in one or more of said translating devices independently of the others.

2. An electric circuit containing a plurality of translating devices, a switch controlling one or more of said devices independently of the rest, and means at a distant control-station for operating the switch by current feeding the translating devices.

3. An electric circuit containing a plurality of translating devices, a magnetically-operated switch controlling one or more of said devices independently of the rest and having its operating-coil in circuit with the translating devices, and means at a control-station to cut down current in the circuit to operate the switch.

4. A constant-current circuit, containing a plurality of translating devices connected in series relation, a switch for cutting in or out one or more of the devices independently of the rest, a switch-operating magnet in circuit with the translating devices, and means at a control-station for varying the current strength.

5. A constant-current circuit, containing a plurality of translating devices including one or more arc-lamps, a switch to cut in or out said lamps, a magnet in circuit controlling the switch, and means at a control-station for short-circuiting the generator.

6. A constant-current circuit, containing a plurality of translating devices including one or more arc-lamps, a magnetically-operated switch to cut in or out said lamps, and a switch at a control-station for making and breaking a short circuit for the generator.

697,162. WEIGHING-SCALE. ORANGE O. JENAS, Dayton, Ohio, assignor to Computing Scale Company, Dayton, Ohio, a Corporation of Ohio. Filed Nov. 11, 1907. Serial No. 604,167. (No model.)

Claim.—In an apparatus such as described, the combination with a subbase made in the form of a flat spider, vertically-adjustable feet arranged around the periphery of said spider and a peripheral track on its upper surface, of a scale-base having a flange extending down around

the periphery of said subbase, a series of antifriction-rollers arranged between the scale-base and a track on the subbase, a screw centrally connecting the subbase and scale-base and constituting a pivot about which the scale-base may travel and whereby the separation of the two is prevented, a series of notches on the subbase and a movable projection on the scale-base cooperating with said notches to hold said parts against accidental relative displacement.

697,163. ELECTRIC SWITCH. GEORGE E. FAIRBANKS, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed May 31, 1901. Serial No. 68,561. (No model.)

Claim.—1. An electric switch, which comprises a spindle having a relatively small non-circular portion, combined with a contact-piece having a non-circular perforation and mounted over the relatively small portion of the spindle, the perforation in said contact-piece being smaller than the larger portions of the spindle on opposite sides of its small portion, whereby the contact-piece is held on the spindle, and said perforation in the contact-piece being larger than said smaller portion of the spindle, whereby the contact-piece can have lost motion with respect to the spindle; said non-circular portion of the spindle and non-circular perforation in the contact-piece cooperating to enable the contact-piece to be rotated by the spindle.

2. An electric switch, which comprises a spindle having a portion of relatively small size, combined with a contact-piece mounted over said relatively small portion and having a perforation which is larger than said small portion, so that the contact-piece can have lost motion with respect to the spindle; said spindle being adapted to rotate said contact-piece.

3. An electric switch, which comprises a spindle having a portion of relatively small size intermediate its ends, combined with a contact-piece mounted at each relatively small portion, said contact-piece having a perforation which is larger than said small portion of the spindle and smaller than the adjacent opposite larger portions of the spindle, so that the contact-piece is retained at the small portion of the spindle and prevented from longitudinal movement; said spindle being adapted to rotate said contact-piece.

4. An electric switch, which comprises a spindle having a portion of relatively small size, and projections extending therefrom beyond the larger portions of the spindle, combined with a contact-piece mounted on said small portion of the spindle, and having a perforation which is larger than the smaller portion of the spindle, said projections serving to rotate the contact-piece when the spindle is rotated.

5. The combination with the rotatable spindle of an electric switch, said spindle having a relatively small portion intermediate its ends, of a contact-piece having a perforation, said contact-piece being held upon the small portion of the spindle by the larger parts of the spindle on opposite sides of the smaller portion, said parts being constructed and arranged so that said contact-piece is rotated by the spindle.

6. The combination with the rotatable spindle of an electric switch, said spindle having a relatively small portion, of a sheet-metal contact-piece having a perforation and held on the small portion of said spindle by the larger opposite adjacent portions, said parts being constructed and arranged so that said contact-piece is rotated by the spindle.

7. The method of manufacturing an electric switch, which consists in operating upon the rotatable switch-spindle to form a portion thereof of reduced size; placing a perforated contact-piece over said reduced portion; and finally swaging the contact-piece, so that it is held with lost motion on the spindle at the reduced portion thereof.

8. The method of manufacturing an electric switch, which consists in operating upon the rotatable switch-spindle to form a portion of reduced size; producing by punching a sheet-metal contact-piece having a non-circular perforation which is larger than the reduced portion of the switch-spindle, and swaging the contact-piece upon the reduced portion of the spindle so that the parts will have a lost-motion connection.

9. The combination with the rotatable spindle of an electric switch,

said spindle having a relatively small portion, of a contact-piece having a perforation held on the small portion of said spindle by the larger opposite adjacent portions.

697,164. ABDOMINAL SUPPORT. ISAAC E. PALMER, Middle town, Conn. Filed Jan. 31, 1902. Serial No. 2,415. (No model.)

Claim.—An abdominal support comprising a band arranged to pass around the body of the wearer above the hips and to extend at the front to the lower portion of the abdomen, the said band consisting of two half-sections substantially inelastic, means for removably closing the two sections at their front ends, means for adjusting the two sections toward and away from one another at their rear ends, tension or pressure straps leading from the opposite sides of the front of the lower portion of the belt, upwardly and rearwardly toward the hip portions of the band, tension or pressure straps leading from the opposite sides of the front of the upper portion of the band rearwardly and means for taking up and letting out said straps to adjust the lower and upper portions of the belt independently of the main adjustment of the belt-sections at the back, substantially as set forth.

697,165. LINK FOR CHAINS. ALEXANDER PALMER, Fairmont, W. Va., assignor to the Wagner-Palmer Manufacturing Company, Fairmont, W. Va., a Corporation of West Virginia. Filed Apr. 27, 1901. Serial No. 57,997. (No model.)

Claim.—1. A link or connecting element for chains or other structures comprising two separable side bars and two end bars, each end bar being integral with one end of one side bar and interlocked detachably with the opposite side bar, and the interlocking ends of the side bars being each provided with a recess into which the free end of an end bar fits, and means for connecting said opposite side bars together.

2. A link or connecting element comprising separable side bars, end bars, each rigidly attached at one end to a side bar and of a length to be inserted partly into the opposite side bar, and thereby positively engage with it, and means separate from the end bars for securing the side bars to the free inserted ends of the end bars, substantially as set forth.

3. A link or connecting element formed of separable side bars and end bars, each end bar being rigidly attached at one end to one side bar and having interlocking detachable engagement with the opposite side bar, and means independent of the end bars for uniting the opposite side bars, substantially as set forth.

4. A link or connecting element comprising side bars, tubular end bars each integral with one end of one side bar and seated in a depression in the opposite side bar but not extending therethrough, and means for securing the parts together, passing through the side bars and the end bars.

5. A link comprising side bars perforated for the passage of connecting-pins, and having recesses E formed in their inner faces, tubular end bars each rigidly secured at one end to a side bar and of a length to extend to the opposite side bar and enter a recess E, whereby the free end of the end bar has an interlocking engagement with a side bar, and connecting-pins, for uniting the opposite side bars, substantially as set forth.

6. A link comprising recessed side bars and cylindrical end bars of uniform diameter from end to end, each end bar being rigidly secured to one of the side bars and of a length to extend to the opposite side bar and arranged to be seated in a recess therein, and means for connecting the opposite side bars, substantially as set forth.

7. A link element comprising a side bar and a hollow or tubular end bar integral with one end of the side bar, the side bar having at its opposite end a recess extending but part way through the side bar and arranged to receive the end bar of a corresponding element, substantially as set forth.

8. A link comprising duplicate elements, each formed of a side bar perforated at its opposite ends for the passage of connecting-pins and having its inner face recessed, as at E, near one end, and a tubular or hollow end bar integral with the side bar and projecting laterally from the side bar near the end opposite the said recess, the end bars being of a length to extend to the opposite side bars and enter the recesses E, and connecting-pins for uniting the side bars, substantially as set forth.

697,166. FLY-WHEEL FOR HARVESTERS. GEORGE L. PHELPS and JOHN G. MORRIS, Chicago, Ill., assignors to the Plano Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed Sept. 23, 1901. Serial No. 78,194. (No model.)

Claim.—1. In a device of the class described, the combination with the fly-wheel, of the shaft upon which it is mounted to rotate, a differential friction member operatively interposed between said shaft and fly-wheel, and a single spring co-operating with said shaft, friction member and fly-wheel to hold them in the desired degree of frictional contact relative to each other; substantially as described.

2. In a device of the class described, the combination with the fly-wheel, and the shaft upon which it is mounted to rotate, of a differential friction member operatively interposed between said shaft and fly-wheel, a single spring co-operating with said shaft, friction member and fly-wheel, and means for adjusting the tension of said spring to obtain the desired degree of friction between said shaft and member, and between said member and fly-wheel; substantially as described.

3. In a device of the class described, the combination with the fly-wheel, of a shaft upon which it is mounted to rotate, a differential friction member operatively interposed between said shaft and fly-wheel, positive one-way clutch mechanism between said fly-wheel and friction member, and a single spring co-operating with said shaft, friction member and fly-wheel to hold them with the desired degree of frictional contact relative to each other; substantially as described.

4. In a device of the class described, the combination with the fly-wheel, of a shaft upon which it is mounted to rotate, a differential friction member operatively interposed between said shaft and fly-wheel, positive one-way clutch mechanism between said fly-wheel and friction member, a single spring co-operating with said shaft, friction member and fly-wheel, and means for adjusting the tension of said spring to obtain the desired

degree of friction between said shaft and friction member, and between said friction member and fly-wheel; substantially as described.

5. In a device of the class described, the combination with the fly-wheel, of a shaft upon which it is mounted to rotate, a differential friction member operatively interposed between said shaft and fly-wheel, and a single means for securing the desired degree of frictional contact between said shaft and friction member, and between said friction member and fly-wheel; substantially as described.

6. In a device of the class described, the combination with the fly-wheel, of a shaft upon which it is mounted to rotate, a differential friction member operatively interposed between said shaft and fly-wheel, positive one-way clutch mechanism between said fly-wheel and friction member, and a single means for securing the desired degree of frictional contact between said shaft and friction member, and between said friction member and fly-wheel; substantially as described.

7. In a device of the class described, the combination of the elongated bearing-sleeve, with the shaft mounted to rotate therein and having a friction-clutch surface thereon, means for rotating said shaft, a fly-wheel mounted to rotate relative to said shaft and having a friction-clutch surface thereon, a friction-clutch member interposed between said shaft and said fly-wheel and having two friction-clutch surfaces complementary to and co-operating with the friction-clutch surfaces on the shaft and wheel, and means for holding said surfaces with the desired degree of frictional contact; substantially as described.

8. In a device of the class described, the combination of the elongated bearing-sleeve, with the shaft mounted to rotate therein and having a friction-clutch surface thereon, means for rotating said shaft, a fly-wheel mounted to rotate relative to said shaft and having a friction-clutch surface thereon, a friction-clutch member interposed between said shaft and said fly-wheel and having two friction-clutch surfaces complementary to and co-operating with the friction-clutch surfaces on the shaft and wheel, and means for holding said surfaces with the desired degree of frictional contact, consisting of a spring interposed between said shaft and wheel; substantially as described.

9. In a device of the class described, the combination of the elongated bearing-sleeve, with the shaft mounted to rotate therein and having a friction-clutch surface thereon, means for rotating said shaft, a fly-wheel mounted to rotate relative to said shaft and having a friction-clutch surface thereon, a friction-clutch member interposed between said shaft and said fly-wheel and having two friction-clutch surfaces complementary to and co-operating with the friction-clutch surfaces on the shaft and wheel, a spring for holding said surfaces in contact, and means for adjusting the tension of said spring to obtain the desired degree of friction between said shaft and friction-clutch member, and between said friction-clutch member and fly-wheel; substantially as described.

10. In a device of the class described, the combination of the elongated bearing-sleeve, with the shaft mounted to rotate therein having a friction-clutch surface thereon, means for rotating said shaft, a fly-wheel mounted to rotate on said shaft and having a friction-clutch surface thereon, a friction-clutch member interposed between said shaft and said fly-wheel and having two friction-clutch surfaces complementary to and co-operating with the friction-clutch surfaces on the shaft and fly-wheel, positive one-way clutch mechanism between said fly-wheel and friction-clutch member, and means for holding said friction-clutch surfaces in contact; substantially as described.

11. In a device of the class described, the combination of the elongated bearing-sleeve, with the shaft mounted to rotate therein and having a friction-clutch surface thereon, means for rotating said shaft, a fly-wheel mounted to rotate on said shaft and having a friction-clutch surface thereon, a friction-clutch member interposed between said shaft and said fly-wheel and having two friction-clutch surfaces complementary to and co-operating with the friction-clutch surfaces on the shaft and wheel, positive one-way clutch mechanism between said fly-wheel and friction-clutch member, a spring for holding said friction-clutch surfaces in contact, and means for adjusting said spring to obtain the desired degree of frictional contact between said shaft and friction-clutch member, and between said friction-clutch member and fly-wheel; substantially as described.

12. In a device of the class described, the combination with the cup-shaped disk 26 having the annular bearing-surface 30 on its inner periphery, of the annulus 31 having the bearing-surface 33 on its periphery co-operating with the bearing-surface 30 and the additional annular bearing-surface 36 thereon, the fly-wheel having the annular bearing-surface 38 thereon complementary to and co-operating with the bearing-surface 36, supports for said disk, annulus and fly-wheel, and means for holding them in frictional contact with each other; substantially as and for the purpose described.

13. In a device of the class described, the combination with the cup-shaped disk 26 having the annular bearing-surface 30 on its inner periphery, of the annulus 31 having the bearing-surface 33 on its periphery, co-operating with the bearing-surface 30, and the additional annular bear-

ing-surfaces 28 thereon, the fly-wheel having the annular bearing-surfaces 29 thereon complementary to and cooperating with the bearing-surfaces 28, supports for said disk, annulus and fly-wheel, and a spring for holding them in frictional contact; substantially as and for the purpose described.

14. In a device of the class described, the combination with the cup-shaped disk 28 having the annular bearing-surfaces 29 on its inner periphery, of the annulus 31 having the bearing-surfaces 28 on its periphery cooperating with the bearing-surfaces 29 and the additional annular bearing-surfaces 36 thereon, the fly-wheel having the annular bearing-surfaces 29 thereon complementary to and cooperating with the bearing-surfaces 36, supports for said disk, annulus and fly-wheel, a spring for holding them in frictional contact, and means for adjusting the tension of said spring to obtain the desired degree of friction between said disk and annulus, and between said annulus and fly-wheel; substantially as described.

697,167. CULINARY CHOPPING-KNIFE. ELWOOD C. PHILLIPS, Chicago, Ill., assignor of one-fourth to Oscar A. Schell, Chicago, Ill. Filed Aug. 23, 1900. Serial No. 51,345. (No model.)

Claim.—A culinary chopping-knife, comprising a handle, and a cutting-blade having a segmental shape and formed with vertically-extending corrugations that taper away from the cutting edge of the blade and have a radial arrangement with relation to a common center, substantially as set forth.

697,168. KNOB-ATTACHING DEVICE. GEORGE E. FEMER, New Britain, Conn., assignor to P. & F. Curtis, New Britain, Conn., a Corporation of Connecticut. Filed Dec. 17, 1901. Serial No. 38,211. (No model.)

Claim.—1. In a device of the character described, a knob-spindle, a knob and a set-screw, openings in said knob for said spindle and set-screw, an independent contact-piece between the inner end of the screw and the knob-spindle and frictionally fitting the opening adapted to receive the screw.

2. In a knob-attaching device in combination, a knob, a shank thereon, a spindle-passageway therein extending longitudinally thereof, a transverse opening therein said opening being screw-threaded, a scalp or contact-piece slightly smaller than the largest diameter of said transverse opening, and a screw cooperating with said contact-piece and carried in said transverse opening.

3. In a knob-attaching device in combination, a knob, a shank thereon, a spindle-passageway therein extending longitudinally thereof, a transverse opening in said shank extending into said spindle-passageway, a flexible scalp or contact-piece carried in said opening and of slightly-less diameter than the largest diameter of said transverse opening, and a screw cooperating with said contact-piece and fitted in said transverse opening.

4. In a knob-attaching device, a knob, a shank, a longitudinal spindle-passageway, an opening extending transversely of the spindle-passageway, a contact-piece within said opening of slightly-less diameter than the diameter of said opening, a screw cooperating with said contact-piece to advance or retract the same.

5. In a knob-attaching device in combination, a knob, a shank, a longitudinal passageway through to receive the knob-spindle, an opening in the side of said shank extending into said spindle-passageway, a set-screw adapted to fit said opening, a scalp or contact-piece at the inner end of said set-screw said scalp being of less diameter than the diameter of said screw, and cup-shaped, substantially as and for the purpose described.

697,169. VIBRATOR FOR WARP STOP-MOTIONS. ALBERT K. FRATE, Winsterville, Mass., assignor to The White Machine Works, Incorporated, of Winsterville, Mass. Filed May 21, 1901. Serial No. 61,319. (No model.)

Claim.—1. A vibrator-blade for warp stop-motions for looms having teeth the vertical clamping edges of which are oblique to the plane of the blade, as described.

2. A guide-plate for warp stop-motions for looms, having two lines of teeth, the clamping edges of which are on a plane oblique to the guide-plate, as described.

3. In a vibrator feeder device for warp stop-motions for looms, a tooth having the clamping edge oblique to the plane of the teeth, as described.

4. In a warp stop-motion for looms, the combination with a guide-plate having two lines of teeth separated by a vibrator-blade having a line of teeth, the clamping edges of said teeth being oblique to the plane of the movement of the vibrator-blade, as described.

697,170. CENTRIFUGAL CREAMER. HERRARD RICE, London, England, and ARATULE BUNZ, Melsfeld, Germany. Filed Aug. 6, 1901. Serial No. 71,102. (No model.)

Claim.—1. In a centrifugal separating-machine, the combination of a rotating bowl and a central feed-sleeve provided with a series of areal plates having radial ribs connecting them at their upper ends with said sleeve, said plates also being inclined upwardly toward said sleeve and forming a divided liner having slots extending from base to top of the liner, and suitably connected together, substantially as set forth.

2. In a centrifugal separating-machine, the combination of a rotating bowl and a central feed-sleeve having a series of areal plates provided with radial ribs connecting them to said sleeve and inclined upwardly and toward said sleeve, and forming a divided liner having slots extending from the base to the top of the liner, said plates being connected upon opposite sides of said slots by short pieces, substantially as set forth.

3. In a centrifugal separating-machine, the combination of a rotating bowl and a central feed-sleeve having a series of areal plates inclined upwardly and toward said sleeve and having slots therebetween, also having radial ribs connecting the edges of said plates nearest the center of the bowl with the said central sleeve, forming a series of partially-closed cells, around said central sleeve, connected with the space outside of the liner-plates by said slots.

4. In a centrifugal separating-machine, the combination of a rotating bowl and a central feed-sleeve having a series of areal plates provided with radial ribs connecting them to said sleeve and inclined upwardly and toward said sleeve, said plates forming a divided liner with longitudinal slots between the edges of the plates, and radial wings attached to the exterior edges of said liner-plates, farthest from the center of the bowl.

5. In a centrifugal separating-machine, the combination of a rotating bowl and a central feed-sleeve having a series of horizontally-curved plates connected by radial ribs to said sleeve and inclined upwardly and horizontally toward said sleeve, said plates forming a divided liner with

longitudinal slots between the edges of the plates, and radial wings attached to the exterior surface of said plates.

6. In a centrifugal separating-machine, the combination of a rotating bowl, a central feed-sleeve having a series of horizontally-curved plates connected by radial ribs to said sleeve and inclined upwardly and toward said sleeve, said plates forming a divided liner with longitudinal slots between the edges of the plates, and a perforated cylindrical cover inclosing said liner-plates, open at its upper end and mounted on the lower edges of the plates, and separate outlets for the cream and milk.

7. In a centrifugal separating-machine, the combination of a rotating bowl and a central feed-sleeve having a series of horizontally-curved plates connected by radial ribs to said sleeve and inclined upwardly and toward said sleeve, said plates forming a divided liner, radial wings attached thereto, a perforated cylindrical cover inclosing said liner and forming, with said wings, partially-closed cells, said plates having between them longitudinal slots connecting the cells on the interior with those on the exterior of said liner.

8. In a centrifugal separating-machine, the combination of a rotating bowl, a central feed-sleeve having a series of horizontally-curved plates connected by radial ribs to said sleeve and inclined upwardly and toward said sleeve, said plates forming a divided liner, with longitudinal slots between the edges of the plates, radial wings attached to said plates, a corrugated cylindrical cover inclosing said plates and having perforations in the depressions and ridges of the corrugations, outlets at the top of the bowl for the cream, and pipes having their inlet at the top of the bowl and their outlet at the bottom of the bowl for the outflow of the skimmed milk.

697,171. COMPRESSED-AIR WATER-ELEVATOR. JAMES R. RICHES, Kingston, Okla., assignor of one-half to George W. Wilson, Kingston, Okla. Filed Dec. 2, 1901. Serial No. 84,861. (No model.)

Claim.—1. The combination with a water vessel, of an air-pipe connected therewith, a liquid-discharge extending from the lower portion of the vessel, an escape-pipe extending from the upper portion of the vessel, an inlet-valve having a stem extending upwardly therefrom, and an escape-valve movable simultaneously with said inlet-valve and adapted to reciprocate upon said stem to close said escape-pipe before the seating of the inlet-valve; substantially as specified.

2. The combination with a water vessel, of an air-pipe connected therewith, a liquid-discharge extending from the lower portion of said vessel, an escape-pipe extending from the upper portion of said vessel, an inlet-valve having a stem extending upwardly therefrom, an escape-valve movably mounted upon said stem, a vent-pipe communicating with said escape-pipe above the escape-valve, and means for automatically opening and closing said vent-pipe; substantially as specified.

3. The combination with a water vessel, of an air-pipe connected therewith, a liquid-discharge extending from the lower portion of said vessel, an escape-pipe extending from the upper portion of said vessel, an inlet-valve having a stem extending upwardly therefrom, an escape-valve movably mounted upon said stem, a vent-pipe communicating with said

escape-pipe above the escape-valve, means for automatically opening and closing said vent-pipe, an inlet-cock for said air-pipe, and a connection between said cock and valve-stem for automatically operating the former; substantially as specified.

4. The combination with a water vessel, of an air-pipe communicating therewith, a liquid-discharge extending from the lower portion thereof, an air-escape valve in the upper portion, an inlet-valve adapted to automatically operate said escape-valve, and a vent adapted to permit the escape of air from the vessel before the opening of the inlet and escape valves; substantially as specified.

5. The combination with a water vessel, of an air-pipe communicating therewith, a discharge-pipe extending from the lower portion thereof, an escape-pipe communicating with the top of said vessel and provided with a valve-chamber therein, an inlet-valve at the lower portion of said vessel, a valve-stem extending upward from said valve, and an escape-valve carried by said stem and adapted to seat before the seating of the inlet-valve; substantially as specified.

6. The combination with a water vessel, of an air-pipe communicating therewith, a discharge-pipe extending from the lower portion thereof, an escape-pipe communicating with the top of said vessel and provided with a valve-chamber therein, an inlet-valve at the lower portion of said vessel, a valve-stem extending upward from said valve, an escape-valve carried by said stem and adapted to seat before the seating of the inlet-valve, a stop-nut on said stem to limit the downward movement of said escape-valve, and an adjustable spring for retaining said escape-valve in yielding contact with said nut; substantially as specified.

7. The combination with a water vessel, of an air-pipe communicating therewith, a discharge-pipe extending from the lower portion thereof, an escape-pipe communicating with the top of said vessel and provided with a valve-chamber therein, an inlet-valve at the lower portion of said vessel, a valve-stem extending upward from said valve, an escape-valve carried by said stem and adapted to seat before the seating of the inlet-valve, a stop-nut on said stem to limit the downward movement of said escape-valve, an adjustable spring for retaining said escape-valve in yielding contact with said nut, a stop-cock upon said air-pipe, and an operating-rod for said cock adjustably connected to said valve-stem; substantially as specified.

8. The combination with a water vessel, of an air-pipe communicating therewith, a discharge-pipe extending from the lower portion thereof, an escape-pipe communicating with the top of said vessel and provided with a valve-chamber therein, an inlet-valve at the lower portion of said vessel, a valve-stem extending upward from said valve, an escape-valve carried by said stem and adapted to seat before the seating of the inlet-valve, a stop-nut on said stem to limit the downward movement of said escape-valve, an adjustable spring for retaining said escape-valve in yielding contact with said nut, a vent-cock upon said air-pipe, an operating-rod for said cock adjustably connected to said valve-stem, a vent-pipe extending from said valve-chamber into said vessel and provided with a stop-cock thereon, and a float for closing said vent-cock; substantially as specified.

9. The combination with a water vessel, of an air-pipe communicating therewith, a discharge-pipe extending from the lower portion thereof, an escape-pipe communicating with the top of said vessel and provided with a valve-chamber therein, an inlet-valve at the lower portion of said vessel, a valve-stem extending upward from said valve, an escape-valve carried by said stem and adapted to seat before the seating of the inlet-valve, a stop-nut on said stem to limit the downward movement of said escape-valve, an adjustable spring for retaining said escape-valve in yielding contact with said nut, a stop-cock upon said air-pipe, an operating-rod for said cock adjustably connected to said valve-stem, a vent-pipe extending from said valve-chamber into said vessel and provided with a vent-cock thereon, a float for closing said vent-cock, and a connecting-neck between said vessel and valve-chamber having its upper end forming a valve-seat for the escape-valve; substantially as specified.

10. The combination with a water vessel, of an air-pipe communicating therewith, a discharge-pipe extending from the lower portion thereof, an escape-pipe communicating with the top of said vessel and provided with a valve-chamber therein, an inlet-valve at the lower portion of said vessel, a valve-stem extending upward from said valve, an escape-valve carried by said stem and adapted to seat before the seating of the inlet-valve, a stop-nut on said stem to limit the downward movement of said escape-valve, an adjustable spring for retaining said escape-valve in yielding contact with said nut, a stop-cock upon said air-pipe, an operating-rod for said cock adjustably connected to said valve-stem, a vent-pipe extending from said valve-chamber into said vessel and provided with a vent-cock thereon, a float for closing said vent-cock, a connecting-neck between said vessel and valve-chamber having its upper end forming a valve-seat for the escape-valve, a suitable guide within said neck for said valve-stem, a stop and guide within the vessel for the lower end of said valve-stem, and an automatically-operated valve for preventing the return of water from said discharge-pipe; substantially as specified.

697,172. HORSESHOE. JOHN RILEY, New York, N. Y. Filed Nov. 16, 1901. Serial No. 22,519. (No model.)

Claim.—1. A horseshoe, comprising a metal frame, having slots and holes therethrough; depending tapered pillars, riveted through the holes in the frame, and projecting above the upper face thereof; an elastic material completely surrounding the frame and engaging the depending and projecting portions of the pillars and binding the portions above and below the frame with integral binders passing through the slots.

2. In a horseshoe, the combination of a metal frame, having clips at the heel and toe, and a yielding material completely surrounding the frame and embodying a tread portion located between the clips.

3. In a horseshoe, the combination of a metal frame, having at the toe a clip or calk depending therefrom, the front of which is in a plane substantially transverse to the plane of the frame; a toe-clip above said calk, having its front face in the same plane as the front of the calk; and rubber completely surrounding said frame and clips.

4. A horseshoe, comprising a metal portion having openings therethrough, tapered pillars attached by their small ends to the metal portion, an elastic material entirely surrounding said metal portion and pillars, bonds integral with and uniting the elastic material on the upper and lower sides of the metal portion, and passing through the openings in the metal portion.

5. A horseshoe, comprising a metal portion, having upwardly-projecting stays, an elastic material secured upon its upper portion and surrounding the stays.

6. A horseshoe, provided with a metal portion, having upwardly-projecting stays and slots; and a hoof-pad applied to such upper portion enveloping the stays and entering the slots.

697,173. WEB-GUIDE FOR PRINTING-MACHINES. OSCAR ROSSER, New York, N. Y., assignor to Robert Hoe, New York, N. Y. Filed June 1, 1901. Serial No. 62,730. (No model.)

Claim.—1. The combination with a web-guide having shoulders which underlie the margins of the web, of a guard loosely mounted thereon serving to hold the web away from the guide, substantially as described.

2. The combination with a web-guide having shoulders which underlie the margins of the web, of a disk loosely mounted thereon serving to hold the web away from the guide, substantially as described.

3. The combination with a web-guide having shoulders which underlie the margins of the web, of a serrated disk loosely mounted thereon serving to hold the web away from the guide, substantially as described.

4. The combination with a web-guide having shoulders which underlie the margins of the web, of a plurality of disks loosely mounted thereon, said disks serving to hold the web away from the guide, substantially as described.

5. The combination with a web-guide having shoulders which underlie the margins of the web, of a plurality of serrated disks loosely mounted thereon, said disks serving to hold the web away from the guide, substantially as described.

6. The combination with a roll forming a web-guide, of a guard loosely mounted thereon serving to hold the web away from the guide, substantially as described.

7. The combination with a roll forming a web-guide, of a plurality of disks loosely mounted thereon, said disks serving to hold the web away from the roll, substantially as described.

8. The combination with a roll forming a web-guide, of a plurality of serrated disks loosely mounted thereon, said disks serving to hold the web away from the roll, substantially as described.

9. The combination with a shouldered roll forming a web-guide, of a guard loosely mounted on the roll between the shoulders serving to hold the web away from the roll, substantially as described.

10. The combination with a shouldered roll forming a web-guide, of a plurality of disks loosely mounted thereon between the shoulders serving to hold the web away from the roll, substantially as described.

11. The combination with a shouldered roll forming a web-guide, of a plurality of serrated disks loosely mounted on the roll between the shoulders, said disks serving to hold the web away from the roll, substantially as described.

697,174. DEVICE FOR PREVENTING SMEARING. OSCAR ROSSER, New York, N. Y., assignor to Robert Hoe, New York, N. Y. Filed June 1, 1901. Serial No. 62,731. (No model.)

Claim.—1. The combination with a plurality of stationary web-guides, of a plurality of shields interposed between the web and the guides, and means for driving the shields, substantially as described.

2. The combination with a plurality of stationary web-guides arranged to change the direction of movement of the web, of a plurality of shields, one for each guide, interposed between the web and the guides, and means for driving the shields, substantially as described.

3. The combination with a plurality of stationary web-guides, of a plurality of endless shields, one for each guide interposed between the web and the guides, and means for driving the shields, substantially as described.

4. The combination with a plurality of stationary web-guides, arranged to change the direction of movement of the web, of a plurality of endless belts, one for each guide, interposed between the web and the guides, and means for driving the belts, substantially as described.

5. The combination with a stationary web-guide provided with means for preventing parts of the web from coming in contact with the guide, of a shield co-operating with said means, and means for driving the shield, substantially as described.

6. The combination with a stationary guide-bar having parts or ribs operating to prevent certain parts of the web or sheet from coming in contact with the body of the bar, of a shield interposed between said raised parts, and means for driving the shield, substantially as described.

7. The combination with a stationary guide-bar provided with raised parts or ribs operating to prevent certain parts of the web from coming in contact with the guide-bar, an endless belt passing around said guide-bar, and means for driving the belt, substantially as described.

8. The combination with a plurality of stationary guides, each guide being provided with raised parts operating to prevent certain parts of the web from coming in contact with the guide, of a plurality of belts, one for each guide interposed between the web and the guides, and means for driving the belts, substantially as described.

9. The combination with a turner-bar having spirally-arranged ribs operating to prevent certain parts of a passing web from coming into contact with the bar, of a belt interposed between the bar and the web, and means for driving the belt, substantially as described.

10. The combination with a plurality of turner-bars having spirally-

arranged ribs thereon, of a shield co-operating therewith, and means for driving the shield, substantially as described.

11. The combination with a plurality of turner-bars having spirally-arranged ribs thereon, of a shield comprising a plurality of belts, one for each bar, and means for driving the belts, substantially as described.

12. In a printing-machine, the combination with means for forwarding two webs, of a turner-bar, one for each web, said bars having spirally-arranged ribs thereon, a plurality of endless belts, one for each bar, a shaft around which the belts pass, means for driving the shaft, and suitably-arranged guides whereby one run of the belts is interposed between the turner-bars and the web passing thereover, substantially as described.

697,175. MECHANISM FOR UTILIZING THE POWER OF ENGINES OR MOTORS. HENRY W. SCHLOMANN, New York, N. Y.; Minnie Schloemann executrix of said Henry W. Schloemann, deceased. Filed July 26, 1901. Serial No. 68,703. (No model.)

Claim.—1. The combination of a main fly-wheel, its shaft and an auxiliary balance-wheel mounted on a shaft separate from the main fly-wheel shaft, but driven directly from it at a higher speed, substantially as and for the purpose set forth.

2. The combination of a main fly-wheel, its shaft and an auxiliary balance-wheel mounted on a shaft separate from the main fly-wheel shaft, between said fly-wheel shaft and its load, and driven directly from the driving-shaft but at a higher rate of speed, substantially as and for the purpose set forth.

3. The combination substantially as hereinbefore set forth of a prime motor, its driving-shaft, a fly-wheel thereon, an auxiliary balance-wheel having a preponderance of weight in its periphery and mounted on an independent or separate shaft and means for driving said auxiliary balance-wheel at a rate of speed higher than that of the fly-wheel.

4. The combination substantially as hereinbefore set forth of a prime motor, its driving-shaft, a fly-wheel thereon, an independent or separate shaft, a motor or generator driven therefrom, an auxiliary balance-wheel mounted thereon, and means for driving the auxiliary balance-wheel at a rate of speed higher than that of the fly-wheel.

697,176. ANALAMATING-MACHINE. EDWARD C. SCOTT, Columbus, Ohio. Filed June 23, 1901. Serial No. 68,500. (No model.)

Claim.—In an amalgamating-machine, the combination with a casing having an inlet-opening at one end and outlet-opening at the other, of an amalgamating-body rotatably supported within said casing and adapted to run in a body of mercury contained within the casing, of a pipe-section leading outward from the body of mercury, a mercury reservoir or holder, means for raising said holder to a higher level than said pipe-section and lowering the same to a level below that of said pipe-section and

a flexible connection between said outlet-pipe and reservoir, substantially as specified.

697,177. ANALAMATING-MACHINE. EDWARD C. SCOTT, Columbus, Ohio. Filed Aug. 23, 1901. Serial No. 71,977. (No model.)

Claim.—In an amalgamator, the combination with a casing having inlet and outlet openings, said casing adapted to contain a body of mercury in the lower portion thereof and rotatably mounted independently-arranged ore-pulp conductors within said casing, said conductors being so arranged as to insure one of their ends being retained at a higher plane than the opposite end during their passage through the lower arc of their revolutionary cycle, and amalgamating material within said conductors, substantially as specified.

697,178. APPARATUS FOR THE TREATMENT OF ORES. ELM L. SHARPEN, Chicago, Ill. Filed Apr. 20, 1901. Serial No. 67,468. (No model.)

Claim.—1. As a means for facilitating the dissolving of the values in ore, the combination of a leaching-tank, a conduit leading from and discharging directly into the tank, and means in the conduit connected with a heating-medium supply for agitating, circulating and heating the liquid contents of the tank.

2. As a means for facilitating the dissolving of the values in ore, the combination of a leaching-tank, a conduit leading from and discharging into the tank, and a jet-nozzle connected with a steam-supply and discharging directly into the conduit whereby the liquid contents of the tank is agitated, circulated and heated.

3. The combination with a leaching-tank of an agitating device for the liquid contents thereof comprising a conduit leading from and returning to the tank, a jet-pump interposed in said conduit for circulating said liquid contents through it and means for raising and lowering the jet-pump and conduit with relation to the said leaching-tank.

4. The combination with a leaching-tank and a filtering-tank of a valved conduit extending between said tanks, a valved branch pipe extending from said conduit below the valve therein back to the leaching-tank and a jet-pump interposed in said conduit between the said leaching-tank and branch pipe, whereby the liquid contents of the leaching-tank may be circulated through said conduit and branch pipe or transferred through said conduit to the said filtering-tank, substantially as described.

697,179. GOLF-CLUB. FRANK L. BLANCHARD, New York, N. Y.
Filed Oct. 3, 1901. Serial No. 71,107. (No model.)

Claim.—A golf-club and the like comprising a handle portion, the cooperating member, and a reinforcing-shaft lying parallel with said handle portion with anchoring-terminals embedded in said handle portion and a thimble surrounding and snugly sleeved upon said handle portion and bearing against said reinforcing-shaft all substantially as and for the purpose specified.

697,180. VENTILATOR FOR CHIMNEYS. CHARLES D. SMITH,
St. Louis, Mo. Filed Apr. 15, 1901. Serial No. 66,831. (No model.)

Claim.—1. The combination with a cone, of a plurality of radial arms adjustably secured to said cone, brackets carried by said arms for engaging

ing with the top of a chimney, and brackets carried by said arms, and a sleeve removably supported by said brackets.

2. The combination with a cone, of a spider secured to said cone, a plurality of radially-adjustable arms attached to said spider, brackets carried by said arms for engaging with the top of a chimney, and brackets carried by said arms for supporting a sleeve.

3. The combination with a cone, of a spider secured to the under face thereof, a plurality of radial arms adjustably attached to said spider, downward extensions on said arms, outwardly-projecting brackets on said downward extensions for supporting a sleeve, and inwardly-projecting brackets also on said downward extensions for engaging with the top of a chimney.

4. In a chimney-ventilator, the combination with a plurality of arms, of a set of brackets carried by said arms for removably securing the same to the top of a chimney, a second set of brackets also carried by said arms, a sleeve removably supported by said second set of brackets, and a cone supported by said arms.

697,181. INSTRUMENT FOR COOLING OR FOR WARMING INTERNAL PORTIONS OF THE HUMAN BODY. ROY E. SMITH, Portland, Oreg., assignor of two-thirds to Lundy R. Smith and Caryl T. Smith, Portland, Oreg. Filed Aug. 26, 1901. Serial No. 73,705. (No model.)

Claim.—1. An instrument of the character described, consisting of a tube D having its front end closed and its rear end provided with a lateral branch, a tube F concentrically within the tube D, a tube A concentric with the tubes D and F and having its front end conical and adapted to embrace the front portion of the tube D, and cement filling the interior of the tube A the whole length thereof, substantially as described.

2. An instrument of the character described consisting of a tube D having its front end closed and its rear end provided with a lateral branch, a tube F concentrically within the tube D, a tube A concentric with the tubes D and F and having its front end conical and adapted to embrace the front portion of the tube D, the three tubes being bent to one side and having a spider-brace within said bent portion, and cement filling

the interior of the tube A, the whole length thereof, substantially as described.

697,182. WINDOW-CHAIR. JOHN F. BRICKMETER, Chicago, Ill. Filed May 12, 1901. Serial No. 60,322. (No model.)

Claim.—1. A window-chair comprising a solid horizontal seat or platform, bars attached to the lower side of said seat and extending from front to rear thereof for the purpose of reinforcing said seat, the extremities of which bars extend forwardly beyond the seat and are adapted to be detachably connected with fixtures on the window-frame, brackets detachably secured to the under side of the seat, one at each side thereof, each of said brackets being provided with arms by which it is attached to said seat and with a part having a vertical screw-threaded opening, and a screw-threaded stud or jack extending upwardly into said opening and provided at its lower end with a head or flange which is adapted to be supported on the outside sill of the window-frame, said studs or jacks being located entirely below the seat and vertically adjustable in said brackets from below the seat.

2. A window-chair comprising a solid horizontal single-piece seat or platform, bars attached to the lower side of said seat and extending from front to rear thereof for the purpose of reinforcing the seat, the extremities of which bars extend forwardly beyond the seat and are adapted to be detachably connected with fixtures on the window-frame, a rail rising from said seat, vertical standards extending between said rail and seat, said standards being curved outwardly at their lower ends, brackets detachably secured to the under side of the seat, one at each side thereof, each of said brackets being provided with arms by which it is attached to said seat and with a part having a vertical screw-threaded opening located a distance below the seat, and a screw-threaded stud or jack extending upwardly into said opening and provided at its lower end with a head or flange which is adapted to be supported on the outside sill of the window-frame, said studs or jacks being vertically adjustable in said brackets from below the seat and located entirely below the seat, and the screw-threaded portions of the brackets being located a sufficient distance from the seat to permit the ends of the screws to extend between the same and the seat in the adjustment of the screws.

3. A window-chair comprising a solid single-piece horizontal seat or platform, laterally-separated bars attached to the lower side of said seat and extending from front to rear thereof, said bars being contained in downward-opening grooves in said seat and the extremities of which bars extend forwardly beyond the seat and are adapted to be detachably connected with fixtures in the window-frame, brackets detachably secured to the under side of the seat, one at each side thereof, each of said brackets being provided with a vertical screw-threaded opening, a screw-threaded stud or jack extending upwardly into said opening and located entirely below the seat and adapted to bear at its lower end on the outside sill of the window-frame, said studs or jacks being vertically adjustable in said brackets from below the seat, and a rail rising from the seat and provided with standards which extend between the rail and the seat, the lower ends of said standards being curved outwardly.

697,183. SUGAR-PADDLE. GENELOUS STOUT, Panama, Cal. Filed Jan. 2, 1901. Serial No. 42,566. (No model.)

Claim.—1. A sugar-paddle comprising a handle, having fluted clamps secured thereon, the clamps extending beyond the handle and carrying in the extended portion thereof binding-screws to detachably secure therein a blade, a wooden blade adapted to be secured within said clamps, the said blade being wedge-shaped, large at the butt and tapering therefrom to an edge at the point of the blade, longitudinal openings therein extending from the butt in the direction of the point of the blade to permit the butt of the blade to be moved past the binding-screws into the clamps and against the handle.

2. A sugar-paddle, comprising a handle and wooden blade and means to secure the blade to the handle and to replace the blade with a new one when it becomes worn and broken, comprising corrugated clamps secured to the handle, having portions extending beyond the handle, binding-screws in said extended portions, the handle having a V-shaped socket for the reception of the butt of the blade, the blades being wedge-shaped and having at the butt-end a V-shaped projection adapted to fit into the socket in the handle.

3. A paddle for use in sugar-making, having a handle provided with means to secure thereto wooden blades and to detach therefrom said blades when they become worn and useless comprising the handle A, having V-shaped socket for the reception of the butt of the blade, the corrugated clamp C attached thereto, and having blade-engaging portions thereof, extending beyond the handle, the said extending portions carrying binding-screws for securing the blade therein, the binding-screws E in said clamps, the wedge-shaped wooden blade B having openings B' in the butt thereof to receive the binding-screws, the blade being V-shaped at the butt to fit in the V-shaped socket in the handle, substantially as shown and described.

697,184. LOOP-TAKING MECHANISM FOR SEWING-MACHINES. HENRY E. TRACY, New Brighton, N. Y., assignor, by mesne assignments, to Jeremiah Evans Tracy, Plainfield, N. J. Filed Dec. 11, 1900. Serial No. 374,367. (No model.)

Claim.—1. In a sewing-machine having a reciprocating needle, the combination of a shuttle or the like arranged near thereto and provided with hooks which one at a time seize the loops of needle-thread; said shuttle or the like being constructed for receiving a ball, spool or cap of thread, and being so mounted as to permit the passage of the loop of thread entirely around it; and a device whereby the shuttle is contained and revolved; the construction and arrangement being such that the thread passes between said revolving device and said shuttle, and one of said hooks takes up the loop previously opened out by another of said hooks.

2. In a sewing-machine having a reciprocating needle, the combination of a shuttle or the like arranged near thereto and provided with hooks which one at a time seize the loops of needle-thread; said shuttle being constructed for receiving a ball, spool or cap of thread; and a revolving shaft wherein the shuttle is carried; one of said hooks taking up the loop previously spread out by another of said hooks.

3. In a sewing-machine having a reciprocating needle, the combination of a shuttle or the like arranged near thereto and provided with opposite peripheral hooks which one at a time seize the loops of needle-thread; said shuttle being constructed for receiving a ball, spool or cap of thread, and being so mounted as to permit the passage of the loop of thread entirely around it; and a device whereby the shuttle is contained and revolved; the construction and arrangement being such that the thread passes between said revolving devices and said shuttle or the like, and one of said hooks takes up the loop previously spread out by another of said hooks.

4. In a sewing-machine having a reciprocating needle, the combination of a shuttle or the like arranged near thereto and provided with opposite peripheral hooks which one at a time seize the loops of needle-thread; said shuttle being constructed for receiving a ball, spool or

cup of thread; and a revolving shaft whereon said shuttle is carried; one of said hooks taking up the loop previously spread out by another of said hooks.

5. In a sewing-machine having a reciprocating needle, the combination of a shuttle or the like arranged near thereto and provided with a series of hook-shaped peripheral projections; and a shaft whereon said shuttle is carried and whereby it is revolved; said shuttle being so carried upon said shaft that the thread may pass entirely around the shuttle and between the shuttle and the shaft; and one of said projections taking up the thread-loop previously spread out by another of said projections.

6. In a sewing-machine having a reciprocating needle, the combination of a shuttle or the like arranged near thereto and provided upon opposite sides with hook-shaped peripheral projections; and a shaft whereon said shuttle is carried and whereby it is revolved; said shuttle being so carried upon said shaft that the thread may pass entirely around the shuttle; and one of said projections taking up the thread-loop previously spread out by another of said projections.

7. In a sewing-machine having a reciprocating needle, the combination of a sectional shuttle arranged near thereto and provided upon opposite sides with hook-shaped peripheral projections; and a two-part shaft whereon said shuttle is carried and whereby it is revolved; said shuttle being so carried between the parts of said shaft that the thread may pass entirely around the shuttle and between said parts of said shaft; and one of said projections taking up the thread-loop previously spread out by another of said projections.

8. In a sewing-machine having a reciprocating needle, the combination of a shuttle arranged near thereto and provided with hook-shaped projections; said shuttle being adapted to receive a spool, ball or cup of thread; and a revolving shaft whereon said shuttle is carried; said shuttle having diverging faces so as to spread out or open the loops of thread, which pass around said shuttle and between said shuttle and said shaft; one of said hooks approaching the needle when another thereof has fully drawn out a loop, and after seizing a bite of thread from the needle operating to take up said loop.

9. In a sewing-machine having a reciprocating needle, the combination of a shell arranged near thereto and provided upon opposite sides with hook-shaped projections; said shell being adapted to receive a spool, ball or cup of thread; and a revolving shaft whereon said shell is carried; said shell having diverging faces so as to spread out or open the loops of thread, which pass around said shell and between the same and said shaft; one of said hooks approaching the needle when another thereof has fully drawn out a loop, and after seizing a bite of thread from the needle operating to take up said loop.

10. In a sewing-machine having an ordinary needle, the combination of a carrier arranged near thereto and designed to receive a spool, ball or cup of thread, and provided with hook-shaped projections; and a driving-shaft connected with the carrier so as to support the same in such a manner as to impart motion thereto, and at the same time to permit the passage of thread between the shaft and the carrier, substantially as described; and one of said projections taking up the thread-loop previously spread out by another of said projections.

11. In a sewing-machine having an ordinary needle, a carrier arranged near thereto and designed to receive a spool, ball or cup of thread, and provided upon opposite sides with hook-shaped projections; and a driving-shaft connected with the shell so as to support the same in such a manner as to impart motion thereto, and at the same time to permit the passage of the thread between the shaft and the carrier, substantially as described; and one of said projections taking up the thread-loop previously spread out by another of said projections.

12. In a sewing-machine, the combination of a shuttle or the like mounted so as to permit the passage of a loop of thread entirely around it, and provided with hooks for engaging loops of needle-thread; and a revoluble device whereon said shuttle or the like is supported and whereby it is revolved; said hooks projecting beyond said revoluble device, and being so disposed that one hook takes up the thread drawn out by the preceding hook.

13. In a sewing-machine, the combination of a shuttle or the like mounted so as to permit the passage of a loop of thread entirely around it, and provided upon opposite sides with hooks for engaging loops of needle-thread; and a revoluble device whereon said shuttle or the like is supported and whereby it is revolved; said hooks projecting beyond said revoluble device, and being so disposed that one hook takes up the thread drawn out by the preceding hook.

14. In a sewing-machine, the combination of a shuttle or the like having a plurality of hooks, and means for supporting said shuttle in operative position and causing the same to rotate; said supporting and rotating means including a rotating shaft whereon said shuttle is carried; and said hooks being so disposed that one takes up the thread drawn out by another.

15. In a sewing-machine, the combination of a shuttle or the like

having a plurality of hooks, and means for supporting said shuttle in operative position and causing the same to rotate; said supporting and rotating means including a rotating shaft whereon said shuttle is carried; said hooks being so disposed that one takes up the thread drawn out by another; and said hooks projecting from the periphery of said shuttle on opposite sides thereof.

16. In a sewing-machine having a reciprocating needle, the combination of a looper arranged near thereto and provided with hooks which one at a time seize the loops of needle-thread; said looper being so mounted as to permit the passage of the loop of thread entirely around it; and a device whereby the looper is sustained and revolved; the construction and arrangement being such that the thread passes between said revolving device and said looper, and one of said hooks takes up the loop previously spread out by another of said hooks.

17. In a sewing-machine having a reciprocating needle, the combination of a looper arranged near thereto and provided with hooks which one at a time seize the loops of needle-thread; and a revolving shaft whereon the looper is carried; one of said hooks taking up the loop previously spread out by another of said hooks.

18. In a sewing-machine having a reciprocating needle, the combination of a looper arranged near thereto and provided with hook-shaped projections; and a revolving shaft whereon said looper is carried; said looper having diverging faces so as to spread out or open the loops of thread, which pass around said looper and between said looper and said shaft; one of said hooks approaching the needle when another thereof has fully drawn out a loop, and after seizing a bite of thread from the needle operating to take up said loop.

697,185. STOVE. ARTHUR W. WALKER, Malden, Mass. Filed Sept. 26, 1901. Serial No. 78,588. (No model.)

Claim.—1. A stove-plate having a flange, an ornamental rim loosely applied to the plate and overlying and covering said flange to present a finished edge to the plate, and means for detachably securing the ornamental rim over said flange with an air-space separating the flange and ornamental rim throughout.

2. A stove-plate having a flange, an ornamental rim loosely applied to the plate and overlying said flange to present a finished edge to the plate, means for readily attaching the said rim to and detaching it from the flange, and a stop for arresting the downward movement of the ornamental rim after the engagement of said means to maintain the rim out of contact with the flange and provide an air-space between the entire rim and flange.

3. A stove-plate having a flange and engaging holes, an ornamental or finishing rim having a rounded surface or contour to conform with and cover said flange and provided with rounded ends, said ornamental rim being provided near its opposite ends with engaging devices to engage the holes in the flange to removably secure the ornamental rim in place over the flange with a space or air-space separating the entire rim from the flange.

4. A stove-plate having a flange, a stop projecting from the flange, a finishing-rim loosely applied to the plate and overlying said flange to present a finished edge to the plate, means for detachably connecting the rim to the flange, said rim having a stop to engage the stop projecting from the flange to limit the downward movement of the rim and maintain the entire rim out of contact with the flange to provide a space or air-space between the entire rim and flange.

5. A stove-plate having a flange, a finishing-rim loosely applied to the plate to cover said flange, and means for detachably connecting the rim to the plate with the upper edge of the rim spaced from and lower than the plate edge so that crumbs or refuse brushed from the plate will pass readily over the rim.

6. A stove-plate having a flange and an ornamental rim loosely applied to the plate, and contained outside of the flange of the plate to leave an air-space extending between the entire flange and the inner side of the rim.

7. A stove-plate having a flange and an ornamental rim loosely applied to the plate to cover the flange, means for detachably supporting the rim over the flange with a space between them, the upper edge of the rim being below the upper surface of the plate.

697,186. MACHINE FOR BORDERING PAPER. EDWARD A. WATT, New York, N. Y. Filed Nov. 17, 1900. Serial No. 26,817. (No model.)

Claim.—1. A machine of the class described, comprising a main frame, drums mounted therein, an endless belt mounted on said drums, a roller positioned between said drums and over which said belt passes, two drums mounted above the main frame one of which is over said roller and the other over one of the drums in the main frame, two endless belts mounted on said last-named drums and separated by a narrow space, inking devices connected with the opposite sides of the main frame rearwardly of said roller and laterally adjustable and another inking device mounted at the rear of said roller and above the same, substantially as shown and described.

2. A machine of the class described, the frame of which is provided at its opposite sides with laterally-adjustable inking devices consisting of separate plates between the ends of which are placed inking-blocks, said blocks being provided adjacent to the main frame of the machine with beveled edges which communicate with inking-spaces between said blocks, substantially as shown and described.

3. A machine of the class described, the frame of which is provided at its opposite sides with laterally-adjustable inking devices consisting of separate plates between the ends of which are placed inking-blocks and blocks being provided adjacent to the main frame of the machine with beveled edges which communicate with inking-spaces between said blocks, and said machine being also provided midway between said first-named inking devices with another inking device, substantially as shown and described.

4. A machine of the class described comprising a main oblong frame, drums mounted in the opposite ends of said frame, a roller positioned between said drums, an endless belt mounted on said drums and passing over said roller, a supplemental frame positioned over the main frame and hinged thereto, two drums mounted in the supplemental frame one of which is over said roller, two endless belts mounted on said last-named drums, inking devices arranged at the opposite sides of the main frame and rearwardly of said roller and another inking device arranged centrally between the first-named inking devices and rearwardly of and above said roller, devices for supplying ink to said inking devices and means for operating said drums, substantially as shown and described.

5. A machine of the class described comprising a main oblong frame having drums mounted in the opposite ends thereof and a roller positioned between said drums, an endless belt mounted on said drums and passing over said roller, a supplemental frame arranged over the main frame and at one end thereof, drums mounted in the opposite ends of the supplemental frame, one of which is over said roller, two endless belts mounted on said last-named drums and separated by a narrow space, said supplemental frame being hinged to the rear end of the main frame, and devices for inking both sides of a sheet of paper at the edges thereof as it is passed through the machine and also for inking one side of the paper at the longitudinal center thereof, substantially as shown and described.

6. A machine of the class described comprising a main oblong frame, drums mounted therein, a roller positioned between said drums, an endless belt mounted on said drums and the upper reach of which passes over said roller, two other drums one of which is mounted over said roller and the other rearwardly thereof over one of the drums in the main frame, two separate belts mounted on said last-named drums and separated longitudinally of the center of the machine, and devices for inking both sides of a sheet of paper at the opposite edges thereof and for inking the longitudinal center thereof on one side, as said sheet of paper is fed between said roller and the drum thereover, substantially as shown and described.

7. A machine of the class described comprising a main frame, an endless belt mounted therein, a roller over which the upper reach of said belt passes, a supplemental frame connected with the main frame and provided with two drums one of which is positioned over said roller, two endless belts mounted on said last-named drums and separated longitudinally of the center of the machine and inking devices mounted rearwardly of said roller and the drum thereover, and adapted to ink both sides of a sheet of paper at the edges thereof, and also the longitudinal center thereof on one side as said sheet is fed between said drum and said roller, substantially as shown and described.

8. In a machine of the class described, an inking device consisting of a frame composed of top and bottom plates, and inking-blocks secured between one end of said plates the adjacent surfaces thereof being beveled at one side, said said blocks being provided in their adjacent surfaces with recesses, and means for feeding ink thereto, substantially as shown and described.

9. In a machine of the class described, an inking device comprising a frame consisting of top and bottom plates connected by screws passing therethrough and provided with springs which separate said plates and inking-blocks placed between said plates at one end, the adjacent sides of said blocks being beveled at one edge and the inner faces thereof being provided with recesses and means for feeding ink to said recesses, substantially as shown and described.

10. A machine of the class described, the frame of which is provided at its opposite sides with projecting supports, longitudinally-adjustable slides mounted on said supports, inking devices mounted on said slides, an inking device mounted centrally of the frame, ink-reservoirs for feeding ink to said inking devices, and means for feeding sheets of paper through and between said side inking devices and beneath the central inking device, substantially as shown and described.

11. A machine of the class described, comprising a main frame and a supplemental frame connected with the top thereof, rollers or drums mounted in the main frame and provided with adjustable collars, a belt mounted on said rollers or drums, rollers or drums mounted in the supplemental frame and provided with end and middle collars, two belts mounted on the rollers or drums in the supplemental frame, and inking devices supported in connection with the main and supplemental frames and adapted to border a sheet of paper as it is passed between the rollers or drums of the main and supplemental frames, substantially as shown and described.

12. A machine of the class described, provided with rollers or drums in the bottom portion thereof, a belt mounted thereon, other rollers or drums in the top thereof provided with two belts separated by a central space, all of said rollers or drums being provided with adjustable collars for holding the belts in proper position, and inking devices at the sides and top central portion of the machine for bordering a sheet of paper as it is passed between the belt on the bottom rollers and those in the upper portion of the machine, substantially as shown and described.

13. A machine of the class described, comprising a main frame provided at each of its opposite ends with a drum, a roller positioned between said drums, a supplemental frame connected with the main frame and provided with two drums, one of which is over said roller, laterally-adjustable inking devices mounted at the opposite sides of the main frame at the rear of said roller, and a central inking device mounted in the supplemental frame and at the rear of said roller and at the rear of the drum in the supplemental frame over said roller, and belts mounted on the drum in the main frame and on the drums in the supplemental frame.

697,187. STEAM-ENGINE. PERLIN B. WHITNEY, Walpole, Mass. Assignor of one-half to J. Edward Plimpton, Norwood, Mass. Filed June 27, 1900. Serial No. 21,799. (No model.)

Claim.—1. A steam-engine having a cylinder provided with two sets of steam-passages, a valve for each set of passages, a pair of slides intermediate the said valves and said passages, and means for operating said valves and said slides to close either set of said passages, for the purposes and substantially as described.

2. In a steam-engine, in combination, a cylinder having two sets of steam-passages, two valves, one co-operating with one set of passages, and the other co-operating with the other set of passages, a pair of movable

slides located between said valves and said passages for closing one set of passages and opening the other set when in one position, and for reversing the condition of the passages when in another position, and means for operating the said valves alternately, substantially as described.

3. In a steam-engine, in combination, two cylinders, each having two sets of steam-passages, with one set of passages of one cylinder crossed as described, two valves, one for controlling one set of passages of one cylinder and the other for controlling one set of passages of the other cylinder, and both connected to move in unison, two other valves, one for controlling the other set of passages of the first cylinder and the other for controlling the other set of passages of the second cylinder, and both connected to move in unison, and two pairs of slides, one pair located between the valves and passages of one cylinder and the other pair located between the valves and passages of the other cylinder, for the purposes and substantially as described.

4. In a steam-engine, in combination, a cylinder provided with two sets of steam-passages, a valve for each set of passages, a pair of slides intermediate the said valves and said passages, substantially as set forth, a throttle, and means connected with said throttle and said slides by which the action of the engine and the steam-supply to the latter are controlled and varied simultaneously.

5. In a steam-engine, in combination, the two cylinders and the steam-chest, the said cylinders having each the two pairs of steam-passages opening into the steam-chest, the slides located at the opposite walls of the said steam-chest, means to move the said slides to control the flow of steam through the respective pairs of passages of each steam-cylinder whereby the said pairs are placed in and out of service alternately with each other, the valves working against the inner sides of the said slides and loosely connected in pairs, and means for actuating said pairs of valves alternately, substantially as described.

697,188. PEA THRESHING AND SEPARATOR. SAMUEL H. WILLIAMS, Birmingham, Tenn. Filed May 12, 1901. Serial No. 69,962. (No model.)

Claim.—1. A pea-threshing runner and concave, each comprising a stripping and a hulling division of unequal diameter, joined by closely-approaching shoulders isolating the two working surfaces, and means substantially as described, whereby a portion of the product discharged from the one may be delivered to the other.

2. A pea-threshing runner and concave each comprising a stripping and a hulling division of unequal diameter, joined by closely-approaching shoulders, isolating the two working surfaces, the teeth in the hulling division being more closely spaced than those in the stripping division, in combination with means to separate the pods from the hain discharged from the stripping division, and means to return the pods to the hulling division, substantially as described.

3. A pea-threshing runner and concave, each comprising a stripping and a hulling division, of unequal diameter, joined by closely-approaching shoulders isolating the two working surfaces, in combination with means to separate the pods from the hain discharged from the stripping division, and means to return the pods to the hulling division, substantially as described.

4. A pea-threshing runner and concave, each comprising a stripping and a hulling division, of unequal diameter, joined by closely-approaching shoulders isolating the two working surfaces, the teeth on said stripping division having narrow front edges and rearwardly-diverging sides, in combination with means to separate the pods from the hain discharged from the stripping division, and means to return the pods to the hulling division, substantially as described.

697,189. MACHINE FOR MAKING BUTTONS OR OTHER ARTICLES. WILLIAM B. ALDEN, Springfield, Mass. Filed June 27, 1901. Serial No. 69,922. (No model.)

Claim.—1. In a machine of the character described, in combination a rotary work-support adapted to hold a number of blanks to be operated upon; a group of stationarily-supported tools disposed about the periphery of the work-support; a cam cooperating with teeth fast to the work-support and adapted to move the work-support a step during part of the revolution of the cam and to lock the work-support during the balance of the revolution of the cam; means for driving the cam; and means connecting said tools and cam for throwing the tools into and out of action while the work-support is locked by the cam.

2. In a machine of the character described, in combination, a rotary work-support adapted to hold a number of blanks to be operated upon; a group of stationarily-supported tools disposed about the periphery of the work-support; a cam cooperating with teeth fast to the work-support and adapted to move the work-support a step during part of the revolution of the cam, and to lock the work-support during the balance of the revolution of the cam; means for driving the cam; a train of intermesh-

ing gears; means for driving the train of gears; and means operatively connecting each tool with one of the gears.

3. In a machine of the character described, in combination, a rotary work-support adapted to hold a number of blanks to be operated upon; a group of stationarily-supported tools disposed about the periphery of the work-support; a cam adapted to move the work-support a step during part of its revolution and to lock the work-support during the balance of the revolution of the cam; means for driving the cam; and teeth fastened to the work-support with provision for adjustment so that each tooth may be adjusted independently of the others to position the work-support relatively to the tools for each step movement of said support.

4. In a machine of the character described, a rotary work-support having tangential pockets in the periphery thereof, and adjustable teeth fitting into said pockets, adapted to be engaged by the cam-actuating means.

5. In a machine of the character described, a rotary work-support; means for imparting an intermittent motion to the work-support; and a brake for holding the work-support stationary between movements, in opposition to which brake the work-support is moved intermittently by its actuating means.

6. In a machine of the character described, in combination, a work-support; means for imparting an intermittent movement to the work-support; a multiplicity of tools; and means, including a train of gears, for throwing the tools into and out of action while the work-support is at rest; means for applying power to the train of gears; and means connecting each tool with one of the gears.

7. In a machine of the character described, in combination, an oil-chamber surrounding the periphery of the work-support; the work-support; a cam for actuating the work-support, and an oil-chamber surrounding said cam.

8. In a machine of the character described, in combination, a rotary work-support; means for imparting an intermittent movement to the work-support; a group of stationarily-supported tools disposed about the periphery of the work-support and means for throwing the tools of the group into action successively during each dwell of the work-support.

9. In a machine of the character described, the tool-operating device consisting of a tool-carrier sliding in perpendicular ways in a frame; a cam; a slide actuated by the cam; and means connecting the slide and tool-carrier, whereby the tool-carrier is perpendicularly reciprocated by the revolution of the cam.

10. In a machine of the character described, the tool-operating device consisting of the tool-carrier sliding in perpendicular ways in the frame; a cam; a slide actuated by said cam; means connecting the slide and tool-carrier to cause the tool-carrier to be perpendicularly reciprocated by the revolution of the cam; and means to rotate the tool as it is reciprocated.

11. In a machine of the character described, a spring finger 70; slide 77 on which said finger is mounted; cam 78 for operating said slide, chuck 23 having a groove 80, and means to actuate the cam; all combined and operating substantially as described.

12. In a machine of the character described, the tool-operating device, consisting of the tool-carrier sliding in horizontal ways in a frame; a cam-pin fast to the carrier; a cam to actuate the pin and carrier and fast to a spur-gear; and the spur-gear.

13. In a machine of the character described, a friction device consisting of an interiorly-tapered hub 16; an exteriorly-tapered split bushing 17 fitting within that hub; a stud 21 fast to the rotary work-support and within the bushing 17; means to force and retain the bushing within the hub; all organized and operating to cause the split bushing to grip the stud with a constant grip as desired.

14. In a machine of the character described, a bed-plate; a rotary work-support sliding near its periphery upon that bed-plate; teeth fast to the rotary work-support; a cam supported by the bed-plate and engaging the teeth to actuate the rotary work-support; and tool-operating devices fast to the bed-plate.

15. In a machine of the character described, the tool-operating device, consisting of a frame; a cam within that frame; a rocker-arm pivoted upon that frame; a sliding member, sliding in ways in the frame engaging the cam and connected with the rocker-arm; a second sliding member, sliding in ways in the frame and having a tool-carrying projection extending beyond the frame; a link connecting this projection and the rocker-arm; all organized so that the motion of the rocker-arm is translated into reciprocation of the sliding member, and so that the power is applied directly above the projection and the tool.

16. In a machine of the character described, a rotary work-support; means for imparting an intermittent movement to the work-support; and a multiplicity of interchangeable self-contained tool-operating mechanisms, each transmitting power to its neighbor, arranged about the rotary work-support.

17. In a machine of the character described, in combination, a rotary work-support; a pocket in the upper face of said support; a hollow work-holder in the pocket; an opening through the bottom of said pocket; and a hollow screw in said opening for holding the work-holder in the pocket.

18. In a machine of the character described, in combination with a work-support-carrying chuck 23 having a groove 80, of the finger 76 for discharging the work from chuck 23; and means for operating finger 76 to cause it to enter groove 80 under the work and to discharge the latter from the chuck.

19. In a machine of the character described; a rotary work-support; means for imparting an intermittent movement to the work-support; a train of tool-operating gears; a number of interchangeable frames by which said gears are carried; tools on some of these frames; and means operatively connecting those tools with their respective gears.

20. In a machine of the character described, a rotary work-support; means for imparting an intermittent movement to the work-support; and a multiplicity of interchangeable self-contained tool holding and operating mechanisms arranged about the rotary work-support.

697,190. LINK FOR CHAINS. THOMAS G. AULMAN, Fairmont, W. Va., assignor to the Wagner-Palmers Manufacturing Company, Fairmont, W. Va., a Corporation of West Virginia. Filed May 11, 1901. Serial No. 59,726. (No model.)

Claim.—1. A connecting link or element for chains and other structures comprising separable side bars, one side bar having two end bars integral therewith, and the other side bar having interlocking engagement detachably with the ends of the said end bars, and means independent of the end bars for connecting said side bars together.

2. A connecting link or element for chains and other structures comprising a side bar formed with two integral inwardly-projecting end bars, each end bar having a transverse aperture and an opposing side bar having sockets or cavities in its inner surface to detachably engage positively with the ends of the said end bars, and having apertures respectively registering with the apertures in the end bars, and pins passing through the said end bars and separable side bars, substantially as set forth.

3. A chain for transmitting power and other purposes, comprising links or elements each made up of a longitudinal or side bar having two tubular transverse bars integral with the ends thereof, and a longitudinal or side bar recessed to form seats for the transverse bars and pins passing through the sides and transverse bars and making a rigid structure thereof, and intermediate links connecting the links first named.

697,191. COMBINED HAND SEED-DRILL AND CULTIVATOR. HENRY K. BACON and HIRSH A. BACON, Fenton, Mich. Filed May 13 1901. Serial No. 59,911. (No model.)

Claim.—1. In a seed-drill, the combination of a hopper, a passage leading from said hopper, and a slide adapted to reciprocate in said hopper at one side of the opening to said passage, said slide being provided with a notch adjacent to said opening.

2. In a seed-drill, the combination of a hopper, a seed-passage leading from said hopper, a slide adapted to reciprocate in said hopper at one side of the opening to said passage, said slide being provided adjacent to said opening with a notch having outwardly-diverging walls.

3. In a seed-drill, the combination of a hopper, a seed-passage leading from said hopper, a slide adapted to reciprocate in said hopper at one side of the opening to said passage, said slide being provided with a notch adjacent to said opening, and a seed-agitator engaging with said slide and adapted to be actuated by the movement thereof.

4. In a seed-drill, the combination of a hopper, a seed-passage leading from said hopper, a slide adapted to reciprocate in said hopper at one side of the opening to said passage, said slide being provided with a notch adjacent to said opening, and a seed-agitator engaging in said notch.

5. In a seed-drill, the combination of a hopper, a horizontal seed-passage leading from said hopper, a slide adapted to reciprocate in said hopper at one side of the opening to said passage, said slide being provided with a notch adjacent to said opening, and a longitudinally-adjustable bottom to said passage.

697,192. METHOD OF CHARGING ACCUMULATORS. ROYAL E. BALL, New York, N. Y. Filed July 1, 1901. Serial No. 61,948. (No model.)

Claim.—1. The method of charging an accumulator composed of a plurality of units, which consists in passing through said accumulator a current the electromotive force of which rises and falls in a series of waves, varying the number of said units in circuit by cutting said units into and out of circuit in a predetermined order during the rise and fall of one of said waves, and then varying the number of said units in circuit by cutting said units into and out of circuit in an order reverse to said first-named order during the rise and fall of a succeeding wave.

2. The method of charging an accumulator composed of a plurality of units, which consists in passing through said accumulator a current the electromotive force of which rises and falls in a series of waves, varying the number of said units in circuit by cutting said units into and out of circuit in a predetermined order during the rise and fall of one of said waves, interrupting the flow of said current through said accumulator during the time when its electromotive force is less than the electromotive force of one of said units, and then varying the number of said units in circuit by cutting said units into and out of circuit in an order reverse to said first-named order during the rise and fall of the succeeding wave.

697,198. MEANS FOR CHARGING ACCUMULATORS. ROYAL E. BALL, New York, N. Y. Filed July 1, 1901. Serial No. 62,641. (No model.)

Claim.—1. An accumulator composed of a plurality of units, an electric circuit connected therewith, means for varying the number of said units in circuit by cutting said units into and out of circuit in a predetermined order, and means for varying the number of said units in circuit by cutting said units into and out of circuit in an order reverse to said first-named order.

2. An accumulator composed of a plurality of units connected in series, an electric circuit connected therewith, means for varying the number of units in said series connection in circuit by cutting said units into and out of circuit in a predetermined order, and means for varying the number of said units in circuit by cutting said units into and out of circuit in an order reverse to said first-named order.

3. An accumulator composed of a plurality of units connected in series, an electric circuit connected therewith, means for varying the number of units in circuit by cutting said units into and out of circuit in a predetermined order, means for automatically breaking said circuit, and means for varying the number of said units in circuit by cutting said units into and out of circuit in an order reverse to said first-named order.

4. An accumulator composed of a plurality of units, a circuit for passing through said accumulator a current of fluctuating electromotive force, automatic means for increasing the number of said units in circuit during the rise in electromotive force of said current and decreasing the number of said units in circuit during the fall in electromotive force in said current, and automatic means for interrupting said current in said circuit when its electromotive force falls below the electromotive force of one of said units.

5. An accumulator composed of a plurality of units, a circuit for passing through said accumulator a current the electromotive force of which rises and falls in a series of waves, means for progressively increasing and decreasing the number of units in circuit in a predetermined order during the rise and fall of one of said waves, and means for progressively increasing and decreasing the number of units in circuit in an order reverse to said first-named order during the rise and fall of the succeeding wave.

6. An accumulator composed of a plurality of units, an electric circuit connected therewith, a reversing-commutator in said circuit, a commutator for increasing and decreasing the number of units in said circuit, brushes bearing upon said commutators and connected with said circuit, and means for producing rotation between said brushes and commutators in synchronism with the fluctuations in electromotive force of the current flowing in said circuit.

7. An accumulator composed of a plurality of units, an electric circuit connected therewith, a reversing-commutator in said circuit, a commutator for varying the number of units in said circuit, a brush connected to one side of said circuit and adapted to bear upon said first-named commutator, a brush connected to the other side of said circuit and adapted to bear on said last-named commutator, and means for producing rotation between said commutators and brushes in synchronism with the fluctuations in electromotive force of the current flowing in said circuit.

8. An accumulator composed of a plurality of units connected in series, a reversing-commutator, connections leading from the segments of said reversing-commutator to the end elements of said series-connected units, a second commutator, connections leading from the segments of said second commutator to the intermediate points in said series connection, brushes bearing on said commutators, and means for producing rotation between said commutators and brushes.

9. An accumulator composed of a plurality of units connected in series, a reversing-commutator, connections leading from the segments of said reversing-commutator to the end elements of said series-connected units, a second commutator, connections leading from the segments of said second commutator to the intermediate points in said series connection, brushes bearing on said commutators, and means for producing rotation between said commutators and brushes.

697,194. CAR-PUSHER. EDWARD C. BUTER AND FRANK RADFORD, Dayton, Ohio. Filed Dec. 12, 1901. Serial No. 65,004. (No model.)

Claim.—1. In a car-pusher, the combination of a base adapted to rest upon a rail and provided with flanges on either side for engaging the sides of the rail, upwardly and inwardly extending flanges arranged along a portion of the upper edges of the base opposite each other and forming guideways, an inclined slidable cheek provided with a relatively long, rearwardly-extending plate of substantially the same width as the cheek

and base, said plate fitting and moving in said guideways, a spring interposed between the rear end of the plate and said base for causing the check to follow the wheel, and a lever mounted on the base for moving forward the wheel of a car, substantially as described.

2. In a car-pusher, the combination of a base provided centrally with an upwardly-extending inclined leg, an operating-lever having its head portion apertured to the rear of its nose, the leg on the base extending through said apertured portion of the lever and connected to such lever by a pivot, an inclined toe having a relatively long rearwardly-extending flat plate adapted to be slidably mounted on said base, inwardly-turned flanges on the top of said base, a rearwardly-extending bolt carried by said plate, a spring coiled about said bolt and interposed between the rear end of the plate and the leg, the rearward movement of the plate being thus limited.

3. A car-pusher comprising in its construction a base, recessed or notched flanges extending downwardly from the longitudinal edges thereof, a pair of legs extending laterally from each of said flanges and spaced apart, and a knife extending transversely of said base, having its edge cut away to snugly fit the contour of the upper edge of a rail, and each end of said knife being secured between one of the pairs of said laterally-extending legs, substantially as described.

4. A car-pusher, comprising in its construction a base, an operating-lever carried thereby, and a transversely-arranged knife secured in the under face of said base and designed to engage a rail for preventing sliding of the base, the under edge of said knife being cut away to fit the contour of the upper edge of the rail, and also being beveled rearwardly for forming a biting edge of its rear longitudinal corner, substantially as described.

5. A car-pusher, comprising a base adapted to fit upon a car-rail, a laterally-extending leg extending upwardly from said base, a lever provided with an opening at a point to the rear of its nose for fitting upon said leg and pivoted upon and holding the same in position, the lever being thus pivoted comparatively far from the wheel which it is to engage, a nose formed on the lever which is rounded at its point on its upper side so that when the handle end of the lever is depressed, the said nose will so clip upon the surface of the wheel that it will tend to push the wheel forward on the track, instead of lifting it therefrom, substantially as described.

697,195. BOX-FASTENER. ARTHUR C. BRIDGEMAN and WALTER A. ANGER, Milwaukee, Wis. Filed Jan. 27, 1902. Serial No. 91,323. (No Model.)

Claim.—1. The combination with a box, provided with a cover and having an opening in its front wall, of a closing-plate rigidly secured to the inner surface of said front wall and wholly covering said opening; a spring-tongue secured between the front of the closing-plate and the back

of the said front wall, and having a dotted free upper end; and a spring-catch secured to the under side of said cover, and having a downward-projecting portion for engagement with the slot in the said spring-tongue.

2. The combination with a box, provided with a cover, and having an opening in its front wall, of a closing-plate rigidly secured to the inner surface of said front wall and wholly covering said opening; a spring-tongue secured between the front of the closing-plate and the back of the said front wall, and having a free upper end formed with a slot and another hole therethrough; a spring-catch secured to the under side of said cover and having a downturned portion for engagement with the slot in said spring-tongue, said spring-catch having also a hole therethrough; and a wire seal passed through the holes in the said catch and tongue, and lying wholly within the walls of the said opening in the front wall, back of the front outer line of said front wall and in front of said closing-plate.

3. The combination with a box, provided with a cover, and having an opening in its front wall, of a closing-plate rigidly secured to the inner surface of said front wall and wholly covering said opening, and being formed with a concave inclined guide-pocket in its upper portion; a spring-tongue rigidly secured to the front surface of said plate, and having play or movement between the plate and the back of the front wall and the free upper end of said spring-tongue having a slot therethrough, and being curved outwardly and upwardly; and a spring-catch secured to the under side of said cover and having a downturned portion for engagement with said guide-pocket in the closing-plate, and a forwardly-projecting end for engagement with the slot in the spring-tongue.

697,196. WEIGHING-MACHINE. EDWIN CAMERON, Brooklyn, N. Y. Filed Apr. 10, 1901. Serial No. 60,366. (No Model.)

Claim.—1. In a device for weighing coal or the like, the combination with a suspended frame, of a tilting bucket pivoted thereon, notches in the side of the bucket, a lever normally spring-pressed into engagement with one of said notches, and means operated by the weight of the material being weighed to disengage said lever and permit of the tilting of the bucket, substantially as described.

2. In a device for weighing coal and the like, the combination with a frame, of a tilting bucket pivoted thereon and having a plurality of compartments with an opening at the top and bottom of each compartment,

4. In a device for weighing a continuous stream of coal, or the like, the combination with a stationary supporting-frame, of links depending therefrom, levers fulcrumed at their outer ends on said links, a frame suspended from said levers at points nearer their fulcrums than their inner ends, a tilting basket having a plurality of compartments and pivoted on said suspended frame, a slot on the tilting basket provided with a notch for each compartment, a bracket secured to the suspended frame, a hatching-lever pivoted intermediate its ends to said bracket having its inner end normally engaged in the slot of the uppermost compartment of the basket and connection between the outer end of the hatching-lever and the inner ends of the first-mentioned levers, substantially as described.

4. In a turn-gate adapted to swing open when its hinged end is lifted, the combination with the gate having apertured hinging-brackets, one of which is provided with oppositely-projecting cam-like arms 13ⁿ, and the hinging-post having apertured hinging-brackets, one of which has shoulders 9ⁿ for the arms 13ⁿ to impinge upon, of the upper and lower cranks mounted on the hinging-brackets on the post, the oblique hinging-rod 10, fixed in said cranks at its respective ends, and means for operating the upper crank to open the gate.

A large, stylized, calligraphic letter 'J' with decorative flourishes, likely a logo or monogram. The letter is rendered in a thick, black, hand-drawn style with a white outline. It features a long, sweeping vertical stroke that curves at the top and bottom. To the left of the main vertical stroke, there is a horizontal bar with a small, curved flourish underneath it. To the right, there is a circular flourish with a small, curved flourish underneath it. The overall design is elegant and artistic, typical of early 20th-century branding.

2. In a three-gate, the combination with the gate having apertured hinging-brackets on its hinging-ends, the hinging-post 1, the hatching-posts 3 and 4, and the hinge-brackets 8 and 9 on the hinging-post, of the upper crank 11, having a bearing in the bracket 8, the lower crank 12,

Claim.—1. Transmitting-gearing comprising a driver, a driven part intermeshing gears carried by said driver and driven part respectively and a clutch interposed between one of said gears and its carrier, said clutch comprising a driving member, engaging parts positively carried thereby, a toothed member and means adapted to be inserted between the engaging parts and the toothed member to retain the engaging parts out of engagement with the toothed member.

2. Transmitting-gearing comprising a driver, a driven part, intermeshing gears carried by said driver and driven part respectively, and a clutch interposed between one of said gears and its carrier, said clutch comprising a driving member having pockets, a member having recesses, balls disposed in said pockets and adapted to engage said recesses, and means to retain said balls in said pockets.

3. Transmitting-gearing comprising a driver, a driven part, intermeshing gears carried by said driver and driven part respectively, and a clutch interposed between one of said gears and its carrier, said clutch comprising a driving member having pockets, a member having recesses, balls disposed in said pockets adapted to engage said recesses, one of said members encompassing the other, and a ring movable longitudinally with respect to said members and having flange to enter between said members and to retain the balls in said pockets.

4. Transmitting-gearing comprising a driver, a driven part, intermeshing slow-speed gears and intermeshing fast-speed gears carried by said driver and driven part, a loose driving-clutch interposed between one of said slow-speed gears and its carrier to drive when the fast-speed gear is not operative and to permit one part to overrun the other when the fast-speed gear is operative, a driving-clutch interposed between one of the fast-speed gears and its carrier and means to hold said last-named clutch out of operation.

5. Transmitting-gearing comprising a driver, a driven part, intermeshing slow-speed gears and intermeshing fast-speed gears carried by said parts, a loose driving-clutch interposed between one of the slow-speed gears and its carrier and a driving-clutch interposed between one of the fast-speed gears and its carrier, said last-named clutch comprising a driving member, engaging parts and a toothed member, and means to retain said engaging parts out of engagement with said toothed member.

6. A two-speed gear comprising a driver, a driven part, intermeshing slow-speed gears and intermeshing fast-speed gears carried by said parts, a loose driving-clutch interposed between one of the slow-speed gears and its carrier and a driving-clutch interposed between one of the fast-speed gears and its carrier, said last-named clutch comprising a driving member having pockets, a member having recesses and balls disposed in said pockets and adapted to engage said recesses, and means to retain said balls in said pockets.

7. Transmitting-gearing comprising a driving-shaft, a driven part, intermeshing slow-speed bevel-gears and intermeshing fast-speed bevel-gears carried by said driving-shaft and said driven part, a loose driving-clutch interposed between one of said slow-speed gears and its carrier, a driving-clutch interposed between one of the fast-speed gears and its carrier and means operable to control said last-named clutch.

8. Transmitting-gearing comprising a driver, a driven part, a fast and slow speed gear fixed on one of said parts, intermeshing fast and slow speed gears carried on the other of said parts, a loose driving-clutch interposed between the last-named slow-speed gear and its carrier to drive when the fast-speed gear is not operative and to permit one part to overrun the other when the fast-speed gear is operative, a driving-clutch interposed between the last-named fast-speed gear and its carrier and means operable to control the engagement of said last-named clutch.

Claim.—1. In a machine of the character named, a tank adapted to contain suitable material for cleansing or sterilizing, or both cleansing and sterilizing, and means for passing a bottle to traverse said tank up and down and from side to side through said material.

2. In a machine of the character named, a tank adapted to contain suitable cleansing or sterilizing material, an endless chain or conveyor passing through said tank up and down and transversely thereof and means for holding a bottle on said conveyor.

3. In a machine of the character named, a tank, a plurality of compartments therein adapted to contain cleansing or sterilizing material, an endless chain or conveyor passing from one compartment to the other, devices for holding a bottle carried by said conveyor, and means for opening and closing said devices for the insertion and removal of the bottle.

4. In a machine of the character named, a tank, a plurality of compartments therein adapted to contain cleansing or sterilizing material, pulleys suitably supported in said compartment, and an endless chain or conveyor around said pulleys and passing from one compartment to the other and adapted to carry bottles thereon.

5. In a machine of the character named, a tank adapted to contain suitable cleansing or sterilizing material, shafts journaled in said tank, pulleys on said shafts, an endless chain or conveyor adapted to pass around said pulleys, agitators in said tank, and means for operating said agitators.

6. In a machine of the character named, an endless chain or conveyor in combination with a bottle-holder on said chain, consisting of spring-arms suitably supported and a guide which passes between said spring-arms to open the same.

7. In a machine of the character named, a tank, compartments therein, a hood over one of said compartments, shafts in said compartments carrying pulleys, an endless belt or conveyor adapted to pass around said pulleys, bottle-holders on said conveyor, and means for opening and closing said bottle-holders.

8. In a machine of the character named, a bottle-holder consisting of a block and spring-arms secured thereto, and a guide which passes between said spring-arms to open the same.

9. In a machine of the character named, a tank, adapted to contain suitable cleansing or sterilizing material, and a hood over said tank adapted to prevent the escape of said material, and means for causing a bottle to traverse said tank in said material.

10. In a machine of the character named, a tank, compartments therein, a hood for one of said compartments arranged to form in the walls thereof a steam-trap, and permitting the entrance of a bottle into said hood and compartment.

11. In a machine of the character named, a tank adapted to contain suitable cleansing or sterilizing material, pulleys in said tank and endless chain or conveyor adapted to pass around said pulleys, agitators in said tank and means for operating said agitators.

12. In a machine of the character named, a plurality of tanks a steam-trap for one of said tanks, and an endless chain or conveyor passing through said tanks and said steam-trap.

13. In a machine of the character named, a plurality of tanks adapted to contain suitable cleansing or sterilizing material, a hood over one of said tanks adapted to form a steam-trap, and means for causing a bottle to pass from one tank to the other and into said tank beneath the hood.

14. In a machine of the character named, a plurality of tanks adapted to contain suitable cleansing or sterilizing material, an endless chain or conveyor adapted to pass from one tank to the other through said material, devices for holding a bottle carried by said conveyor, and means for opening and closing devices for the insertion and removal of the bottle.

15. In a machine of the character named, a plurality of tanks, adapted to contain suitable cleansing or sterilizing material, an endless chain or conveyor adapted to pass through said tanks, and from one to the other, agitators in said tanks, and means for operating said agitators.

697,202. MECHANISM FOR TRANSFERRING BOATS. LEON DOWNS, Chicago, Ill., assignor to Le Forest Ingersoll and Frederick Ingersoll, Pittsburg, Pa. Filed May 26, 1901. Serial No. 62,299. (No Model.)

Claim.—1. As a means for moving boats from one level to another the combination of two shafts provided with wheels, one of said shafts being located below the level from which the boat is to be moved, and the other shaft at a higher level, an endless belt or apron provided, arranged around the wheels on said shafts and provided with supports for the boat, and means for preventing a sagging of the carrying portion of the endless belt or chain, substantially as set forth.

2. As a means for moving boats from one level to another, the combination of two shafts provided with wheels, one of said shafts being located below the level from which the boat is to be moved, and the other shaft at a higher level, an endless belt or apron passing around the wheels on said shafts, supporting-blocks secured to the belt or apron, and guideways or supports for the blocks extending from one level to the other, substantially as set forth.

3. The combination of two water-channels located on different levels, two pairs of shafts provided with wheels, one shaft of each pair being located below the level of the water in the respective channel, and the other shaft of each pair being located in a plane above the water in the higher channel, endless belts or aprons arranged around the wheels on said pairs of shafts, supporting-blocks secured to said belts, and guideways or supports for the ends of the blocks extending between the shafts of each pair, substantially as set forth.

4. The combination of two water-channels located on different levels, two shafts provided with wheels, one of said shafts being located below the level of the water in the lower channel, and the other shaft above the level of the other channel, an endless belt or chain arranged around the wheels on said shafts, boat-supports secured to the belt or chain, means for preventing a sagging of the carrying portion of the endless belt or chain, and means for receiving the boat from said supports and directing it into the other channel, substantially as set forth.

697,203. MITER-BOX. RUFUS H. DOWS, Los Angeles, Cal. Filed June 5, 1901. Serial No. 62,233. (No model.)

Claim.—1. A circular miter-box mounted by means of a pivot at its center upon a circular spider whose outer ring or periphery constitutes a clamping-surface for enabling the circular miter-box to be clamped thereto in any angular position required, and by releasing the clamping-screws, to be readily rotated on the pivot into any required position, the central part of said spider constituting the means for holding in their operative position the rings to which the radially-movable backs of the miter-box are fastened, the ring of the spider being provided with feet, all operating in the manner and for the purposes, substantially as hereinbefore described.

2. In combination with a miter-box table or base and with stops adjustable in slots therein, the movable backs against which the mitering or timber being cut rests with passages or short tunnels therein for enabling the said backs to be moved over and without impediment by the stops whereby the mitering or timber being cut is maintained against the movable backs, whereby also the stops are enabled to be moved in their grooves or slots to the rear of the movable backs, substantially as hereinbefore described.

3. The combination of a circular miter-box, the pivot at the center of the circular miter-box, the spider carried upon said pivot, the legs and clamping-screws attached to the table of the miter-box and operating in conjunction with the ring of the spider, substantially as hereinbefore described.

4. The combination of the circular miter-box, the pivot, the spider, the legs, the clamping-screws, the feet in the clamping-ring of the spider and the movable backs with passages or short tunnels therein, all operating together in the manner and for the purposes substantially as set forth.

697,204. CHURN. JOHN GRONOVYER, Danville, Ill. Filed June 15, 1901. Serial No. 64,715. (No model.)

Claim.—1 The herein-described churn comprising a suitable body a standard rising therefrom, a pair of arms at right angles to the standard upon opposite sides, pulleys carried by said arms, a shaft mounted in the upper end of the standard, a grooved wheel journaled upon the shaft, a bracket upon the forward part of the standard provided with a pair of arms, sliding recesses formed in the outer end of said arms, a spool having a reduced upper end, a grooved central portion and a reduced lower end mounted in said recesses, an endless cord or band passing around the wheel, through the pulleys and crossing over and around the grooved portion of the spool to transmit power to the spool and hold the same in the recesses, a churn-receptacle upon the base, and means carried by the spool for charging and supplying air to the contents of the receptacle.

2. A churn comprising a suitable base, a standard rising therefrom, an arm secured to the rear side of said standard and having its ends extending upon each side and at right angles thereto, pulleys secured to the upper portion of said ends, a shaft journaled in the upper end and extending to the rear of the standard, a grooved crank-wheel mounted upon said shaft, an arm secured to the forward side of said standard and provided with a recess so as to form two parallel arms the lower one of which is in line with the arm secured to the rear of the standard, vertical recesses or lugs formed in the outer end of said arms so as to align with each other, a spool provided with a reduced upper end and a reduced lower end having a collar therearound journaled, respectively, in the recesses of said arms, a grooved pulley formed integral with said spool, an endless belt passing around the wheel, through the pulleys, crossing over and then around the grooved pulley of the spool, to transmit power to the spool

and hold it in the recess, an aerating-tube carrying a dasher secured to the lower end of the spoon below the collar, and a churn-receptacle mounted upon the base.

3. A churn comprising a suitable base, the standard rising therefrom a bracket provided with two parallel aligned arms provided with vertical slots in the ends thereof carried by the standard, a churn-receptacle mounted upon the base and having its center directly below the center of the inner edge of the slots, a spoon having a terminal at one end and one near the other end fitting in said slots, a collar near the lower end, a hollow tube fitting upon the lower end and abutting against the collar, a series of air-directing apertures carried by the tube near the top thereof, a dasher carried upon the lower end of the tube which is above the bottom of the receptacle and surrounded by the same, a mechanism for revolving the tube and keeping the spoon in the slots connected to the standard.

697,205. HANDLE FOR WASHBOILERS. EUGENE T. HALL, Philadelphia, Pa. Filed Aug. 2, 1901. Serial No. 71,312. (No model.)

Claim.—1. A handle of the character stated, having a grip, and a supporting-bracket therefor, the latter consisting of arms, a collar adapted to embrace said grip, and a clip embracing said side arms, said arms being provided with means for attachment.

2. In a handle of the character stated, a grip-supporting bracket, consisting of a pair of arms with crimps thereon, and a clip embracing said pair of arms and formed with a crimp, which latter engages the crimps of said arms.

697,206. CLUTCH. HERMAN L. REMBERG, Stephens Mills, N. Y. Filed Aug. 31, 1901. Serial No. 74,008. (No model.)

Claim.—1. In a clutch, cooperating members, one of the members having inclined grooves and the other member having an annular groove and notches extending therefrom, and balls fitted in the respective grooves and constituting antifriction and gripping elements, substantially as set forth.

2. In a clutch, cooperating members, one of the members having inclined grooves and the other member having an annular groove and inclined notches extending from the said groove, and balls fitted in said grooves and constituting gripping elements, substantially as set forth.

3. In a clutch, cooperating male and female members, the female member having inclined grooves in its inner wall and the male member having an annular groove in its projecting portion and notches extending from the said groove, and balls fitted in the said grooves and adapted to effect an interlocking between the members and cause simultaneous rotation thereof in the same direction, substantially as set forth.

697,207. MANUFACTURE OF WATER AND FAT PROOF PAPER WITH GLAZED SURFACE. HERMANN HERTZ, Bonn, Germany. Filed July 31, 1901. Serial No. 70,000. (No specimens.)

Claim.—To employ supplementarily to (before, during, or after) all other processes for making paper waterproof, a coating of lac varnish and then a coating of talc, drying and otherwise treating the paper both after the lac and after talc coating, substantially as set forth and described.

697,208. FOLDING STEP FOR CARS OR OTHER CONVEYANCES. BLANKA J. HURT, New York, N. Y. Filed June 24, 1900. Serial No. 21,702. (No model.)

Claim.—1. The combination with a vertically-vibrating and endwise-movable hanger, of a step pivotally connected therewith, a trans-

verse link pivotally connected to said hanger, and an arm pivotally connected with said link and said step, as and for the purpose specified.

2. The combination with a pair of vertically-pivoted hangers, of a step pivotally connected to the front hanger, a link pivotally connected with both hangers, and an arm pivotally connecting the link and said step, as shown and described.

3. The combination with a vertical pivoted hanger, having a leg, of a step provided with a recessed portion whereby to pivot the same to the leg, the step being also provided with an extension whereby to adapt the same to abut against the under side of said leg, a link pivoted to an ear of said hanger, and an arm pivoted to the extension of said step, and to said link, substantially as specified.

4. The combination with a series of vertically-vibrating and endwise-movable hangers, a transverse cross-bar pivoted to the hangers, a step mounted on the cross-bar, and a step pivoted to the lower end of the outer hanger, and means connected to said hangers whereby to fold the steps, as and for the purpose set forth.

5. The combination with a vertically-pivoted hanger, of a step pivotally connected therewith, a link pivotally connected to the rear portion of the hanger, a guide-arm pivoted to the link and step, and means for folding the hanger and step together, as shown and described.

6. The combination with a pivotally-expanded hanger, of a step pivotally connected therewith, a link pivotally connected with the hanger, a guide-arm pivotally connecting the link and step, a rear hanger pivotally connected with said link, and means for actuating the last-mentioned hanger, to fold the first-mentioned hanger and step together, as shown and described.

7. In folding steps for cars and other conveyances, the combination with a cross-bar having central and end hangers vertically pivoted thereto, and steps pivoted to the cross-bar and hangers, and means connected to the hangers whereby to fold said steps and hangers, as shown and described.

8. In folding steps for cars and other conveyances, the combination with a central vertical hanger, a cross-bar pivoted midway thereof, and vertical hangers pivoted to the ends of the cross-bar, and steps pivoted to said cross-bar and said hangers, substantially as specified.

697,209. DEVICE FOR FACILITATING TAKING PILLS. BENNO KORTENHAUSEN, Unterhaching, Germany. Filed July 24, 1901. Serial No. 69,801. (No model.)

Claim.—As a means for facilitating the taking of medical pills the combination with a small vessel adapted to receive such a quantity of liquid as suffices to wash down a medical pill, of a pipe forming a longitudinal extension of said vessel and a grate located at the inner end of said pipe and being adapted to support the pill to be washed down by the liquid contained in the said vessel; the said pipe being hinged obliquely with regard to the vessel and its free end being obliquely cut away in the same direction of inclination so as to be adapted to form a gap behind the tongue when pressed down upon the inner end of the latter, substantially as described and shown.

697,210. CORNSTALK-CUTTER. NORMAN C. KRAMER, Wallon, Ind. Filed July 11, 1901. Serial No. 67,375. (No model.)

Claim.—1. A stalk-cutting machine comprising vertical shafts mounted for sliding movement, a fixed knife connecting the shafts, cutters mounted upon and rotatable with the shafts in operable relation to the fixed knife, means for rotating the shafts and means for raising and lowering the shafts slidably and therewith the cutters.

2. A stalk-cutting machine comprising an axle having supporting-wheels, vertical cutter-shafts provided with cutting mechanisms, ches at the lower ends of the shafts, and a tongue connected with the axle and with the ches.

3. A stalk-cutting machine comprising an axle having supporting-wheels, cutter-shafts connected with the axle and adapted for longitudinal sliding movement, means connected with a supporting-wheel for rotating the cutter-shafts, ches at the lower ends of the cutter-shafts, a tongue connected with the axle, movable connections between the tongue and ches, and means for raising and lowering the cutter-shafts with the tongue.

4. A stalk-cutting machine comprising an axle provided with supporting-wheels, a drive-shaft mounted upon the axle and operatively connected with a supporting-wheel for rotation thereby, a double beveled gear mounted upon the drive-shaft, means for clatching the double gear to the shaft, vertical cleaves rotatably mounted upon the axle and provided with bevel-gears engaged with the double gear, said cleaves having angular passages therethrough, cutter-shafts slidably fitted in the passages of the cleaves, a fixed cutter mounted upon the shafts, movable cutters mounted upon the shafts for cooperation with the fixed cutter, and means connected with one of the cutter-shafts for raising them both with the cutters thereon.

5. A stalk-cutting machine comprising cutter-shafts, a fixed knife mounted upon the cutter-shafts, and cutters carried by the shafts and rotatable therewith in operative relation to the fixed knife.

6. A stalk-cutting machine comprising cutter-shafts, a fixed knife having terminal bearings in which the shafts are mounted, and cutters carried by and rotatable with the shafts in operative relation to the fixed knife.

7. A stalk-cutting machine comprising shafts mounted for longitudinal sliding movement, a fixed knife having bearings in which the shafts are received, cutters mounted upon and rotatable with the shafts in operative relation to the fixed knife, means for rotating the shafts, and means for sliding the shafts longitudinally to raise and lower the cutters.

697,911. STOPPER FOR JARS. LINDY LOEWENBERG, New York, N. Y. Filed Feb. 17, 1902. Serial No. 94,532. (No model.)

Claim.—1. A stopper for jars composed of a plug, a surrounding flexible covering, a cap engaging said covering, and means for removably securing said cap to the plug, substantially as specified.

2. The combination of a perforated plug, with a superposed perforated cap, a connecting soft-metal fastener having upwardly-extending cheeks that are bent down over the cap, and a flexible covering surrounding the plug and clamped between plug and cap, substantially as specified.

697,912. TEXTILE-ROLLER CLEARER. EDWIN S. MATTHEWS, Providence, R. I. Filed May 2, 1901. Serial No. 92,493. (No model.)

Claim.—1. A clearer for textile rolls consisting of a pair of horizontal bars, holders having loops and arranged to slide on said bars, bars carrying felt strips, connecting said holders together and arranged to rest on the rolls to be cleared, rolls covered with felt and held in the loops of said holders on the upper side of the top rolls, and said top rolls, substantially as described.

2. In a clearer for textile rolls the combination of a pair of horizontal bars having their front ends turned down, holders with loops, arranged to slide on said bars, bars with strips of felt in said holders on the top of the rolls to be cleared, rolls covered with felt and held in loops of said holders on the upper side of the top rolls, and a bar having a lining of

felt, made flat at each end to the turned-down ends of the horizontal bars, substantially as described.

3. In a textile-roll clearer the combination of a series of bars carrying strips of felt, a series of rolls covered with felt and driven by the top rolls, means for connecting each bar of the series with a roll of the series, and connections between each pair of a bar and a roll, and the other like pair in the same division of the top rolls, substantially as described.

4. In a textile-roll clearer, drawing-rolls, a series of flexible or gathering strips supported throughout their length running parallel with and bearing against said rolls, in combination with means for collecting and retaining the waste as that as gathered by said flexible strips, and arrangements for pressing said strips against the rolls by the action of said rolls when revolving, substantially as described.

5. In a textile-roll clearer, a series of drawing-rolls, a series of flexible gathering-strips bearing against the surface of said rolls with means for adjusting each individual strip separately to bear against the surface of its roll, in combination with means for collecting and retaining the waste when gathered by said strips, substantially as described.

6. In a textile-roll clearer, a series of drawing-rolls, a series of flexible gathering-strips bearing against the surface of said rolls held automatically adjusted by their weight vertically, and mechanically adjustable laterally, in combination with rolls for collecting and retaining the waste when gathered by said strips, substantially as described.

697,913. APPARATUS FOR MAKING IRON OR STEEL. EDUARD HEMMINGHAUS, Düsseldorf, Germany, assignor to Joseph Leinberger, Darmstadt, Germany. Filed Nov. 22, 1901. Serial No. 92,398. (No model.)

Claim.—1. In a furnace for producing wrought iron or steel direct from the ore in combination with a crucible 16 having an opening 26 in its enlarged top, a self-closing valve 26 upon said opening, a screw-spindle 27 guiding said valve, an outlet-pipe 28 near the upper end of the crucible for letting out dross and also molten metal from the crucible, an opening 29 at the bottom of the crucible, said opening communicating with two channels 30 and 31 respectively, the first one of which serving for opening or closing said opening by a plug 32 at the end of a spindle 32 passing through said channel 30; the other one, 31, serving for letting out fluid metal out of the crucible or for blowing air and gases into the crucible, the whole as described and illustrated and for the purposes set forth.

2. In a furnace for producing wrought iron or steel direct from the ore, a crucible 16 having an opening 26 in its enlarged top, a valve 26 closing said opening, an outlet-pipe 28 near its upper end, an opening 29 at the bottom, channels 30 and 31 communicating with said opening, channels 18 surrounding said crucible, a lining 11 of refractory bricks inclosing said channels, a layer of fire-bricks 10 outside of the lining 11 and

leaving channels 23 between the lining 11 and the fire-bricks 10, a lining 9 surrounding the fire-bricks 10 made of material conducting heat badly and a casing 1 and bottom 2 of sheet metal surrounding the whole, a hinged cover 3 lined inside with fire-bricks 12 covering the crucible and leaving a passage 19 between the top of the crucible and the lining, said passage communicating with the channels 18 and with an exhaust-pipe 20 connected to the cover 3, an air-pipe 21 and valve 21' communicating with a channel 22 leading to the channels 23 at the upper part of the furnace, a free space 13 below the bottom of the crucible, said space communicating with the channels 23 by holes 24 and with the channels 18 and also with a pipe 14 for blowing in gas by a valve 15 of a gas-main outside of the furnace, the whole as described and illustrated and for the purpose set forth.

697,214. HAT-BLOCK. CARL HOLLER, Berlin, Germany. Filed Aug. 18, 1901. Serial No. 72,527. (No model.)

Claim.—An apparatus for stretching or altering the form and dimensions of hats without alteration of the brim comprising a stand having a foot *a'* and stand having a passage for gas forked at its upper end, an elliptically-shaped plate *f* secured to the stand on which works a hat-block in two parts *g g'* carrying side plates *l l'* having claws *l'' l'''* to engage the upper edge of the plates *g g'* and parts *g g'* and plates *l l'* being operated by means of female screws *h h'*, *m m'* and screw-splines *i i'*, *n n'* respectively, said stand *a* at its upper end being reduced and carrying a hollow hat supported, adjustable thereon by means of a screw *e*, brim-holders *s s'* provided with cushions *q q'* and curved cheeks *r r'* carried adjustably in brackets *t t'* on the hat-block, substantially as set forth.

697,215. DREDGING APPARATUS. PATRICK E. MOLAN and MORRIS MORRISON, Superior, Wis., assignors of three-fifths to David E. Roberts, Taylor E. Wolford, and William E. Locke, Superior, Wis. Filed July 24, 1900. Serial No. 24,961. (No model.)

Claim.—1. In a dredging apparatus, a tank having a hemispherical screen mounted upon rollers therein, a jet-pipe mounted in the wall of the tank above the said screen, an intake-pipe mounted in the wall of the tank below the said screen, a suction-pipe, and mechanism for revolving the screen, substantially as shown and described.

2. In a dredging apparatus, a tank having a jet-pipe and intake and suction pipes mounted in its wall, a revolving hemispherical screen mounted upon rollers within the tank intermediate the jet-pipe and the intake and suction pipes, and mechanism for revolving the screen, substantially as set forth.

697,216. BOX. HARVEY GLASSMAN, Hoboken, N. J., assignor to Kirschbaum & Glitschewsky Company, a Corporation of New York. Filed Oct. 2, 1901. Serial No. 77,268. (No model.)

Claim.—1. In a device of the character described, the combination of a box-body having in its rear wall a plurality of cut-out pieces bent inwardly, a cover having a socket projecting therefrom on one side, and an inward projection at the opposite side, a piston, and a spring one end

of which projects through the box-body and bears against the inside of the cover and a projection near the other end of the spring extending through the box-body, substantially as shown and described.

2. In a device of the character described, the combination of a box-body having in its rear wall a plurality of cut-out pieces bent inwardly, a cover having a socket projecting therefrom on one side, and an inward projection at the opposite side, a piston and a spring one end of which projects through the box-body and bears against the inside of the cover, a projection near the other end of the spring extending through the box-body and a separable base-plate therein substantially as shown and described.

697,217. MACHINE FOR WORKING RUBBER. JOHN H. FRANK, New Haven, Conn., assignor to Henry Stuart Hotchkiss, New Haven, Conn. Filed Apr. 22, 1901. Serial No. 54,908. (No model.)

Claim.—1. In a machine for working rubber, the combination with a plurality of film-forming mechanisms, one of which includes a finishing-roll, a pressure-roll arranged to coast directly with the said finishing-roll for uniting and blending into one sheet the several films produced by the several film-forming mechanisms, and means connected with the pressure-roll for moving it toward and away from the said finishing-roll coming it to automatically accommodate its position to variations in the thickness of the films.

2. In a machine for working rubber, the combination with a plurality of film-forming mechanisms, one of which includes a finishing-roll, a pressure-roll arranged to coast directly with the said finishing-roll for uniting and blending into one sheet the several films produced by the several film-forming mechanisms, and means connected with the pressure-roll for causing it to automatically accommodate its position to variations in the thickness of the films.

3. In a machine for working rubber, the combination with a plurality of film-forming mechanisms, one of which includes an inclined finishing-roll, and a pressure-roll arranged to coast directly with the said finishing-roll, whereby the films produced by the respective film-forming mechanisms are united and blended between the said finishing-roll and the said pressure-roll after the finishing-roll has acted upon one film and before that film has left its surface.

4. In a machine for working rubber, the combination with a plurality of film-forming mechanisms, one of which includes an inclined finishing-roll, of a pressure-roll arranged to have its upper surface coast directly with the lower surface of the said finishing-roll, whereby the films produced by the respective film-forming mechanisms are united and blended between the finishing-roll and the pressure-roll after the finishing-roll has acted upon one film and before that film has left its surface.

5. In a machine for working rubber, the combination with an upper series of rolls including a finishing-roll, for producing a film of rubber, of a lower series of rolls for producing a film of rubber, and a pressure-roll located between the two series of rolls in position to have its upper surface coast directly with the lower surface of the finishing-roll of the upper series, the films produced by the respective series of rolls being passed between the said finishing-roll of the upper series and the upper surface of the pressure-roll, whereby the said films are united and blended together after the finishing-roll has acted upon one film and before that film has left its surface.

6. In a machine for working rubber, the combination with a plurality of film-producing mechanisms, one of which includes a finishing-roll, of a pressure-roll coasting directly with the said finishing-roll for

uniting and blending the respective films formed by the said mechanisms, the said pressure-roll being driven frictionally by the said finishing-roll when coating therewith, and means connected with said pressure-roll for rotating it independently of the said finishing-roll.

7. In a machine for working rubber, the combination with a plurality of film-producing mechanisms, one of which includes a finishing-roll, of a pressure-roll coating directly with the said finishing-roll for uniting and blending the respective films formed by the said mechanisms, the said pressure-roll being driven frictionally by the said finishing-roll when coating therewith, and means for rotating the said pressure-roll independently of the said friction-roll and automatically brought into operation when the said pressure-roll is moved away from the finishing-roll and out of operation when it is moved up to the same.

8. In a machine for working rubber, the combination with a plurality of film-forming mechanisms, one of which includes a finishing-roll, of a pressure-roll coating directly with the said finishing-roll for uniting and blending the respective films formed by the said mechanisms, the said pressure-roll being frictionally driven by the said finishing-roll when coating therewith, movable supports for the pressure-roll by which it is moved toward and away from the said finishing-roll, and a driving mechanism for the pressure-roll automatically brought into action for driving the said pressure-roll when the same is moved away from the finishing-roll and automatically out of action when the said pressure-roll is moved up to the said finishing-roll.

9. In a machine for working rubber, the combination with a plurality of film-forming mechanisms, one of which includes a finishing-roll, of a pressure-roll coating directly with the said finishing-roll for uniting and blending the films into one composite sheet, and an adjustable guide-roll coating with the said finishing and pressure rolls.

10. In a machine for working rubber, the combination with a plurality of film-forming mechanisms one of which includes a finishing-roll, of a pressure-roll coating directly with the said finishing-roll for uniting and blending the films into one composite sheet, pressure-layers carrying the said pressure-roll and movable toward and away from the said finishing-roll, and means for driving the said pressure-roll independently of the said finishing-roll which normally drives it frictionally.

11. In a rubber-working machine, the combination with a plurality of film-forming mechanisms, one of which produces a film of uneven surface, of means for uniting and blending the films including that having an uneven surface, so as to produce a composite sheet with the uneven surface of the film of uneven surface exposed on one side of the said sheet.

12. In a machine for working rubber, the combination with a plurality of film-forming mechanisms, one of the said mechanisms having an inclined finishing-roll, of a pressure-roll coating with the said inclined roll for uniting and blending on the inclined roll before the film acted upon thereby has left its surface, the several films produced in the machine.

697,918. DOOR-HANGER. JOHN J. ECKHART, Chicago, Ill., assigner to himself and Gilbert E. Shaw, Chicago, Ill. Filed Aug. 2, 1901. Serial No. 73,722. (No model.)

Claim.—1. A door-hanger, composed of a suitable frame having suitable channels, and two sets of traveling bearing devices mounted in said channel channels and arranged to run in a track, substantially as described.

2. The combination of a suitable frame, a plurality of sets of traveling bearing devices carried therein, said sets being arranged side by side, and a rail having a convex surface on which said bearing devices run, substantially as described.

697,919. ELECTRIC CIRCUIT PROTECTOR. CHARLES A. BAILEY, Chicago, Ill., assigner to the Rolfe Electric Company, Chicago, Ill., a Corporation of Illinois. Filed Dec. 8, 1902. Serial No. 96,481. (No model.)

Claim.—1. In a protector for electric circuits, a releasing device comprising a metallic shell, a mass of fusible or softenable material enclosed within the shell, a heat-generating device associated with the softenable or fusible material so that the latter will be fused or softened by the generation of heat in the heat-generating device, and a loop or hook engaged

by the fusible or softenable mass so as to be held thereby when such mass is hard and to be released when the same is fused or softened, the metallic shell and loop or hook being electrically connected with the heat-generating device.

2. In a protector for electric circuits, a releasing device comprising a metallic shell, a body or mass of fusible or softenable material enclosed within the shell, a coil of fine wire associated with the body or mass of fusible or softenable material so that the latter will be fused or softened by the generation of heat in the coil of wire, and a loop or hook engaged by the fusible or softenable material so as to be held thereby when such material is hard and to be released by the fusion or softening of the same, the said hook having its free end projecting out of the metallic shell and the coil of wire having one of its ends connected with the metallic shell and the other with the loop or hook, substantially as described.

3. In a protector for electric circuits, a releasing device comprising a conical-shaped metallic shell, a body or mass of fusible material enclosed within the shell, a coil of fine wire embedded in the body or mass of fusible material, and a hook having one of its ends surrounded by the coil of fine wire and the other end projected out of the said mass of material and also out of the metallic shell, the coil of wire having one of its ends connected with the hook and the other with the metallic shell, substantially as described.

4. In a protector for electric circuits, a releasing device comprising a conical-shaped metallic shell, a body or mass of wax enclosed within the shell, a coil of fine wire embedded in the body or mass of wax, and a hook having one of its ends surrounded by the coil of fine wire and the other end projected out of the said mass of wax and also out of the metallic shell, the coil of wire having one of its ends connected with the hook and the other with the metallic shell, substantially as described.

5. In a protector for electric circuits, the combination with a releasing device comprising a metallic shell, a body of fusible or softenable material contained by the shell, a heat-generating device associated with the body of fusible or softenable material, and a loop or hook having one of its ends engaged by the said mass of material so as to be held thereby when said material is hard and to be released when the same is fused or softened, the heat-generating device being electrically connected with the shell and hook, of a contact adapted to engage the said metallic shell, and a tension device adapted to engage the hook, substantially as described.

6. In an electrical protector for electric circuits, the combination with a base having contact-jaws, of a holder consisting of an insulating-strip having its opposite ends provided with contacts adapted to fit into said contact-jaws, said strip being also provided with an aperture between its ends, a spring secured to one end of the strip and connected with the contact at that end, a metallic strip connected with the contact at the other end of the insulating strip and extended to the aperture therein and constructed with portions arranged to substantially coincide with said aperture, a releasing device comprising a conical shell, a metallic hook, a mass or body of fusible or softenable material, and a coil of fine wire, the said wire being coiled about the end of the hook and connected with the same and with the shell, and the mass of fusible or softenable material being enclosed within the shell and embedding the end of the hook and the fine-wire coil, the said releasing device being arranged with the metallic shell in the aperture in the insulating-strip and in contact with the said contact-strip extending from one of the contacts and the hook in engagement with the spring, substantially as described.

7. In a protector for electric circuits, a holder comprising an insulating-strip having its opposite ends provided with metallic contacts and provided with an aperture between its ends, a metallic strip extended from one of said contact-strips along the under side of the insulating-strip and having a forked end, whose bifurcations embrace the aperture in the insulating-strip, and a spring secured to the other end of the insulating-strip and connected with the contact at each other end, substantially as set forth.

8. In a protector for electric circuits, the combination with a spring and a contact, both composed of conducting material, of a releasing device comprising a metallic shell or casing, a mass of heat-responsive material enclosed therein, a heat-generating device, and a metallic hook or like connection engaged by the heat-responsive material, the said device consisting of a single bodily-removable unitary structure, and the shell or casing and hook being connected in circuit and adapted for engagement with the contact and spring, respectively, substantially as described.

9. In a protector for electric circuits, the combination with a base having contact-jaws, a holder having metallic tips adapted to fit into said contact-jaws and also provided with an aperture, a metallic strip extending from one of said metallic tips to the aperture on the lower side of the holder, a spring mounted at the opposite end of the holder, an across-current-operated device having a metallic shell adapted to fit into said aperture and also adapted to rest against the said metallic strip, and a connection between said across-current-operated device and spring for holding the latter normally in tension, substantially as described.

697,220. SKYLIGHT. ALLEN H. SWAPLER, St. Paul, Minn. Filed Mar. 1, 1901. Serial No. 46,417. (No model.)

Claim.—1. In a skylight, the combination, with the bars 2 and the glass panes resting thereon, of gutters suspended beneath the lower edges of said bars, and plates 17 having wings 18 provided on said bars beneath the abutting ends of said plates, for the purpose specified.

2. In a skylight, the combination, with the bars 2 and the glass panes resting thereon, of gutters suspended beneath the lower edges of said bars, clips 9 interposed between the abutting ends of said plates, and wings or clips provided on the sides of said bars and adapted to receive the drippings from said clips 9, for the purpose specified.

3. In a skylight, the combination, with the curb 3 having a water-outlet 15 and the trough 16, of bars provided on said curb and upwardly-inclined therefrom, gutters provided beneath the lower edges of said bars and adapted to direct the drippings therefrom into said trough, for the purpose specified.

4. In a skylight, the combination, with a curb 2, of inclined bars supported thereon, metal ribs provided in the upper edges of said bars and extending lengthwise thereof, glass panes resting upon said curb and bars between and abutting said ribs, means for securing said plates, gutters provided on the lower edges of said bars, and troughs arranged on the inside walls of said curb to receive the contents of said gutters, substantially as described.

5. In a skylight, the combination, with wooden curb-bars arranged at an incline, of metal ribs inserted into the upper edges of said bars and extending lengthwise thereof, glass panes resting upon said bars between and abutting said ribs, a suitable filling material such as putty closing the joints between said ribs and glass and wherein the edges of the glass are embedded, gutters suspended beneath the lower edges of said bars and adapted to gather up the leakage and water of condensation, and wings provided on said bars between said gutters and the abutting edges of said plates, substantially as described.

6. In a skylight, the combination, with wooden curb-bars arranged at an incline, of metal ribs inserted into the upper edges of said bars and extending lengthwise thereof, glass panes resting upon the upper edges of said bars between and abutting said ribs, means for securing said plates, clips interposed between the abutting edges of said plates to conduct the leakage to the sides thereof, gutters substantially V-shaped in cross-section suspended beneath the lower edges of said bars to receive the leakage from said clips and the water of condensation from said plates and bars, and water-conducting means provided on said bars between said gutters and said clips, substantially as described.

7. In a skylight, the combination, with wooden curb-bars arranged at an incline and having substantially flat upper and lower edges, of metal ribs inserted into the upper edges of said bars and extending lengthwise thereof, glass panes resting upon the flat upper edges of said bars between and abutting said ribs, clips interposed between the abutting edges of the plates substantially at right angles to said bars, V-shaped gutters provided on the lower edges of said bars and guiding strips or plates provided on said bars between said gutters and said clips, for the purpose specified.

8. The combination, with wooden bars arranged at an incline, of a curb wherein said bars are supported, metal ribs inserted into the upper edges of said bars and extending lengthwise thereof, glass panes resting upon said upper edges and said curb between said ribs and abutting the same, means for holding said plates in place, gutters provided on the lower edges of said bars to receive the drippings therefrom, troughs near the lower ends of said gutters and discharge-holes provided in said curb wherein the leakage of the skylight and the water of condensation are directed by said troughs, substantially as described.

9. In a skylight, the combination, with the curb-bars and the glass panes resting thereon, of gutters provided beneath the lower edges of said bars, clips 18 having depending loops 14 provided on said bars and sup-

porting said gutters, clips 8 provided between the abutting ends of said plates and wings secured on said bars between said gutters and said clips, for the purpose specified.

10. In a skylight, a curb provided with troughs on its inside wall and discharge-holes communicating with said troughs, in combination, with curb-bars and plates, and gutters carried by said bars and adapted to deliver the drippings from said plates to said troughs.

697,221. BOTTLE-FILLING MACHINE. LOUIS SYMMER and CHARLES W. WILLIAMS, New York, N. Y., assignors to The Century Squeezer Company, New York, N. Y., a Corporation of New Jersey. Filed Apr. 27, 1901. Serial No. 57,786. (No model.)

Claim.—1. In a bottle-filling machine, the combination, with a guide-stack suitably supported, of a cup-shaped housing guided and shiftable longitudinally on said stack, means for supplying liquid directly into the bottle, and means for removing the stopper from the bottle, substantially as set forth.

2. In a bottle-filling machine, the combination, with a suitably-supported guide-stack, of a housing guided on said stack and being shiftable longitudinally thereon, means for supplying liquid to the bottle while housed, and means for picking the stopper up completely from the mouth of the bottle so that no part of the stopper projects into the mouth, and for shifting the same bodily to one side out of the path of the supply-stream, substantially as set forth.

3. In a bottle-filling machine, the combination, of a housing or casing for horizontally inclining the neck portion of the bottle to be filled, a longitudinally-movable gripper or clutch adapted to engage the stopper, means for exerting a pull on the gripper for unscrewing the stopper, means for shifting the gripper with the attached stopper to one side, and means for supplying and shooting the liquid directly into the bottle, substantially as set forth.

4. In a bottle-filling machine, the combination, of a housing or casing for horizontally inclining the neck portion of the bottle to be filled, a spring-jaw gripper, the jaws of which are suitably recessed to engage the stopper of the bottle to be filled, a slide-rod to which the gripper is pivoted, means for operating said slide-rod, means for shifting the gripper sidewise, and means for supplying liquid directly into the mouth of the bottle, substantially as set forth.

5. In a bottle-filling machine, the combination of a housing or casing for horizontally inclining the neck portion of a bottle to be filled, means for operating said housing, and a guide-stack suitably supported and on which the housing is movable, said stack being provided with a liquid-supply passage or channel, and also an independent and separate air-outlet passage or channel, both extending longitudinally through the guide-stack, substantially as set forth.

6. In a bottle-filling machine, the combination, with a suitably-supported guide-stack provided with air and liquid passages, of a housing or casing shiftable on said guide-stack and adapted to receive the neck portion of the bottle to be filled, a gripper or clutch at the outer end of the guide-stack, means for exerting a pull on the gripper, and means for shifting the same to one side, substantially as set forth.

7. In a bottle-filling machine, the combination, with a suitably-sup-

ported guide-stack provided with a liquid-supply channel, and a stationary tubular discharge-nozzle projecting from the lower end of said channel, of a housing or casing shiftable longitudinally on the guide-stack, means for operating the housing, means for unscrewing the stopper from the bottle and shifting the same to one side, and means for permitting the escape of the air displaced from the bottle, substantially as set forth.

8. In a bottle-filling machine, the combination, with a spring-jaw gripper or clutch for engaging the bottle-stopper, of means for shifting the gripper or clutch laterally, so as to move the stopper to one side, substantially as set forth.

9. In a bottle-filling machine, the combination, with a spring-actuated gripper or clutch adapted to engage the stopper of the bottle, of means for shifting the gripper or clutch to one side against the action of its spring, substantially as set forth.

10. In a bottle-filling machine, the combination, with a guide-stack provided at one end with an incline or cam surface, of a housing or casing guided on the said stack, a stopper gripper or clutch provided with a shoulder, means for exerting a pull on said gripper, whereby the shoulder is brought in contact with said incline, and means for supplying a liquid into the bottle while housed, substantially as set forth.

11. In a bottle-filling machine, the combination with a stack having a longitudinal bore, of a slide-rod, one of the ends, being irregular in cross-section, so as to provide minute passages or channels between the adjacent points of contact of the slide-rod and the wall of the bore, and suitable means actuated by the slide-rod for unscrewing the bottle, substantially as set forth.

12. In a bottle-filling machine, the combination, with a suitably-supported housing or casing adapted to horizontally incline the neck portion of the bottle to be filled, of means for automatically opening the stopper of the bottle, means for filling the bottle, a relief device or valve, a hand-lever connected with said hand-lever and engaging said disconnected from the spindle of the valve of the relief device, substantially as set forth.

13. In a bottle-filling machine, a slide-rod, having a pivoted stopper gripper or clutch thereon, provided with automatically-opening recessed gripping-jaws, substantially as set forth.

14. In a bottle-filling machine, a slide-rod, in combination with a spring-jaw gripper or clutch pivoted to the said rod, and a spring leading to also the gripper with the rod, substantially as set forth.

697,222. CLASP FOR GARMENT-SUPPORTER. THOMAS P. TAYLOR, Bridgeport, Conn. Filed Feb. 10, 1902. Serial No. 58,595. (No model.)

Claim.—1. In a garment-supporter comprising a steel and a slotted metal plate carried by a suitable tape, the loop secured in position intermediate of said plate and steel, said loop composed of a non-elastic core and an outer covering of rubber, substantially as set forth.

2. In a garment-supporter comprising a steel and a slotted metal plate carried by a tape, the loop secured in position intermediate of said plate and steel, which loop does not extend to the bottom of said slot in said plate and is composed of a core of non-elastic flexible material and an outside covering of rubber, substantially as set forth.

697,223. MAP-WRINGER. FRANK W. TRAVIS, Birmingham, Ala., assignor to Anna B. Travis, Birmingham, Ala. Filed Aug. 21, 1901. Serial No. 54,598. (No model.)

Claim.—1. In a map-wringer, the combination with a rigid frame having perforate walls, of a rotating jaw pivoted in said frame on the side nearest the center of the roll, on a single center of oscillation; a swinging jaw pivoted to the frame on the side toward the wall of the roll, and an operating-handle connected with the frame having an operative connection with said swinging jaw, substantially as specified.

2. In a map-wringer, the combination with a rigid frame having perforate walls, of a rotating jaw pivoted in said frame on the side nearest the center of the roll, on a single center of oscillation; a swinging jaw

pivoted on the frame on the side toward the wall of the roll, having a perforate bottom attached thereto, and an operating-handle connected with the frame having an operative connection with said swinging jaw, substantially as specified.

3. The combination in a map-wringer of a frame, two opposing-jaws mounted in said frame one of which is movable, both of which jaws are provided with grid-bars having V-shaped faces and so disposed that the faces of the bars of one jaw shall oppose the spaces between the bars of the other jaw, and means for actuating one of the jaws, substantially as specified.

4. The combination in a map-wringer of a frame, a movable compressing-jaw mounted in said frame and means connected therewith for actuating the same, an accommodating jaw pivoted on the frame on a single center of oscillation, and a device intermediate said jaws and actuated by the back stroke of the compressing-jaw for setting the accommodating jaw to its most open position to take in a map, substantially as specified.

5. The combination in a map-wringer of a frame and two opposing-jaws supported therein, one of which is pivoted on a single center of oscillation and the other is arranged to reciprocate toward and from the first, both of said jaws having parallel V-shaped faces and so disposed that the faces of the bars of one jaw shall oppose the spaces between the bars of the other, the reciprocating jaw being provided with a horizontal perforated plate which forms the bottom of the inclosure which receives the map, and a retracting-hook connected with the reciprocating jaw adapted to cooperate with the bottom edge of the oscillating jaw to open the jaws to their widest capacity on the completion of the back stroke of the reciprocating jaw, substantially as specified.

697,224. VEHICLE-REACH. JAMES W. TRAVIS, Boardman, and HARRISON A. DUNN, Medical Lake, Wash. Filed Sept. 20, 1901. Serial No. 71,528. (No model.)

Claim.—1. The combination with a two-part reach, of two plates secured to one part of the reach on its upper and lower sides against movement and provided with stop-ears, a bolt pivotedly connecting the other part of the reach to the forward end of the plates, and a coiled spring carried by the rear end of the forward part of the reach and adapted to coast with the stop-ears and thereby relieve the pivot-bolt of undue strain, substantially as set forth.

2. The combination with a two-part reach, of two plates secured to one part of the reach on its upper and lower sides against movement and provided with stop-ears, a bolt pivotedly connecting the other part of the reach to the ends of the plates, and a coiled spring located in a transverse aperture formed in the rear end of the forward part of the reach and having its ends projecting beyond the sides thereof and adapted to engage the stop-ears and thereby relieve the pivot-bolt of undue strain, substantially as set forth.

697,225. FARM-WAGON BODY. BRADLEY F. WARDENBURG, Rock Hill, S. C. Filed Oct. 17, 1901. Serial No. 71,521. (No model.)

Claim.—1. In a wagon-body, the combination with the sides, the bottom and an end-gate section, of corner angle-plates secured to the ends of the mid section projecting beyond the same to receive and overlapping upon the ends of the sides, and devices attached to the sides and adapted to pass through the said corner angle-plates and other devices pivotally connected to the said corner angle-plates and adapted to engage the abutment devices in connecting the parts, substantially as set forth.

2. In a wagon-body, the combination with the sides, the bottom and an end-gate section, of corner angle-plates secured to the ends of the mid section projecting beyond the same to receive and overlapping upon the ends of the sides, said corner angle-plates having mortises and lapped or outwardly-bent portions, and latch angle-plates secured to the sides and adapted to pass through the lapped and mortised portions and project beyond the surfaces of the corner angle-plates, and pivoted locking-levers adapted to engage the free ends of the latch angle-plates in connecting and holding the parts together, substantially as set forth.

3. In a wagon-body, the combination with the sides, the bottom and an end-gate section, of corner angle-plates secured to the ends of the mid section projecting beyond the same to receive and overlapping upon the ends of the sides, having mortises in the rear portions that are secured upon the mid and section and lapped or outwardly-bent portions in the overlapping ends of mid angle-plates and adjacent to the mortises, latch angle-plates connected to the sides by bolts passing through mortises therein and which provide an adjustment, said latch angle-plates passing beneath and through the lapped portions and mortises and projecting beyond the surfaces of the corner angle-plates and pivoted locking-levers with gravity-handles and cam-ribs secured to the corner angle-plates at the ends of the end section and adapted to engage grooves in the free edges of the latch angle-plates in connecting the parts and securing the same together, substantially as set forth.

697,226. AUTOMATIC PIANO-PLAYER. FRANK C. WHITE, Morristown, Conn., assignor to White & White Company, Morristown, Conn., a Corporation of Connecticut. Filed Nov. 24, 1901. Serial No. 227,761. (No model.)

Claim.—1. In an automatic piano-player, the combination with the body-casing, and pneumatically-controlled action devices or puppets; of finger-actuating members respectively provided with means for engagement of the playing-finger at various positions thereon, a series of detachably-engaged playing-fingers actuated thereby, and means for the support of said fingers adjustable for elevation and depression within the casing, for changing the operating relation and height of the series of fingers with respect to the positions of engagement with the finger-actuating members, and to the pneumatically-controlled action devices.

2. An automatic piano-player having an independently-adjustable series of playing levers or fingers, in combination with the finger-actuating mechanism, the fingers and operating devices having means for connecting and operating said fingers at different positions of height in relation to the actuating mechanism.

3. In an automatic piano-player, the combination, with the fingers, finger-bed and mano-controlled action devices; of a series of finger-engaging levers or pistons respectively provided with a plurality of notches, lugs or detents engageable with said fingers, at different positions or heights thereon, and means for adjusting the finger-bed for establishing engagement of the fingers with the lever-detents, at different working positions.

4. The combination, with the finger-bed, the player levers or fingers, and the upright standards or supporting-guides for the ends of said bar, of bearing-pieces adjustable up and down said guides, said bearing-pieces respectively provided with an arm whereon said finger-bed is movably supported, means for securing said finger-bed upon the arms, and devices for securing the bearing-pieces at adjustable position on the guides.

5. The combination of a finger-piston having a series of notches, lugs or projecting detents, a finger-lever adapted for detachably engaging therewith at its free end, a slidable finger-bed in which said finger is pivotally fingered, supports for containing the bar and fingers, and means for releasing said finger-bed for disengaging and reengaging said finger and with either of said lever-detents, and means for securing said finger-bed at the positions of adjustment.

6. In an automatic piano-player, the combination with actuating members and playing-fingers mutually engageable at steps or positions corresponding with notches or detents on the actuating members, and a movable finger-bed carrying said fingers; of guides, and adjustable supporting devices for said finger-bed adapted for adjusting and containing the finger-bed and fingers at said step positions, and for varying the adjusted relation of the finger-bed to stand above or below the normal working level of the fingers as engaged at the respective notches or detents.

7. In an automatic piano-player, the combination of a movable finger-bed, the series of playing-fingers fingered thereon, guiding-supports for the respective ends of said finger-bed, and adjusting levers or bearing-pieces connecting said finger-bed to the guiding-supports, said bearing-pieces being independently adjustable thereon at each end of the bar, and adapted for permitting a skew or inclined adjustment of said bar and series of fingers relatively to the level of the action-bed.

8. In an automatic playing attachment for manual musical instruments, comprising a pneumatically-operated action mechanism, a set of organ-reeds with valves and tracker-pins therefor, a series of manual playing-fingers, a finger-bed or bar that is adjustable up and down to different working positions; the finger-actuating pistons respectively having a plurality of notches or detents for engaging the finger, and provided with a rest for the end of said tracker-pin, and a foot-pin engaging the action-puppet, substantially as and for the purpose set forth.

9. In an automatic piano-player provided with a set of organ-reeds or sound-producing devices, the combination, of the detented lifters, the playing-fingers engageable therewith at different heights, a movable finger-bed carrying said fingers, standards, and guide-rods and/or movable in said standards, supporting-bearings for said finger-bed adjustably secured on said guide-rods, and a controlling means, substantially as described, for moving said guide-rods within the standards for throwing the fingers into and out of playing contact.

10. In a piano-player, the combination with the finger-actuating pistons having a plurality of finger-engaging notches or detents, a series of disengageable fingers, and the adjustably-supported finger-bed carrying said fingers; of an overer device adapted for supporting the finger ends in serial alignment when disengaged from the lifters.

11. In a piano-player, the combination with the finger-bed carrying the fingers, the standing guide-rod and the bearing-piece adjustable on said guide-rod and having an arm upon which said finger-bed is supported; of a set-screw threaded into said arm and/or and impinging against the guide-rod, and a collar-nut threaded upon said set-screw and impinging against said finger-bed, for the purpose set forth.

12. In a piano-player, in combination with the notched finger-actuating lifters, the adjustable finger-bed carrying the fingers, the adjustable bar-supporting bearing-piece, and standard guide-rods; of a spring-pressed steel arranged in said bearing-piece, and a guide-standard having lugs or recesses for engaging with said steel in corresponding relation to the detents of the lifters, for the purpose set forth.

13. In a piano-player, a finger or playing lever having a pressure-head consisting of a conical or cylindrical cushioned block transversely secured to a metal spring, the opposite end of said spring-arm being connected by fastening devices to the under side of the finger at a distance from its end, and an adjusting screw arranged through the end of the finger, and impinging upon the spring-plate at the back of the head, substantially as shown and described.

14. In an automatic piano-player, the combination, of a finger-actuating member having a plurality of engaging detents, a series of playing-fingers having ends adapted for engaging therewith, a finger-bed carrying said fingers, and finger-bed supports that afford horizontal move-

ment and vertical adjustment at each end of said finger-bed, and means for independently confining the parts at adjusted positions.

697,227. INNER TUBE FOR PNEUMATIC TIRES. FRANK A. WILSON, Erie, Pa., and JOHN E. GARNER, Akron, Ohio, assignors to Pennsylvania Rubber Company, Erie, Pa., a Corporation of Pennsylvania. Filed Feb. 24, 1902. Serial No. 22,392. (No model.)

Claim.—1. In an inner tube for pneumatic tires, an end closure comprising the end portion thereof turned back into the tube, the adjacent faces of said internal portion of the tube cemented together, and a reinforcing-strip of rubber or fabric cemented around the end of the tube, substantially as set forth.

697,228. MACHINE FOR SHREDDING AND GRINDING LEATHER. ROBERT J. YOUNG, Philadelphia, Pa. Filed Nov. 22, 1901. Serial No. 22,222. (No model.)

Claim.—1. In a shredding machine of the character stated, a beater formed of a body, a shaft carrying the same, and arms projecting radially from said body in combination with blades having radial slots in their inner ends which latter are seated on said arms, and bolts passing through said slots into said arms.

2. In a shredding-machine of the character stated, a casing having a concave throat and openings in its wall, in combination with shoulders projecting radially from the exterior of said casing adjacent to said openings, blades passing through said openings and having slots on their exterior ends, which latter are seated on said shoulders, and bolts passing through said slots into said shoulders.

3. A casing having a concave throat, blades passing freely through the wall of said casing and projecting into said concave, and bolts on the exterior of said casing for connecting said blades with said wall and adjusting them in inwardly and outwardly directions.

4. A casing having a concave throat, blades passing freely through the wall of said casing, said blades being provided with slots, radially-extending shoulders on the exterior of said casing and screws passing through said slots into said shoulders.

5. A casing having a concave throat, stationary blades entering said concave, a rotary beater with blades thereon in said concave, the opposed edges of the sets of said blades being respectively of cutting and grinding nature and means for adjusting the blades of the concave and beater in inwardly and outwardly directions.

6. In a machine of the character stated, a casing having openings therein, blades freely fitted in said openings and projecting outside of said casing, the exterior portions of said blades having slots therein, radial shoulders on the exterior of said casing, and bolts passing through said slots, in combination with a beater having arms and blades adjustably connected with said arms.

7. In a machine of the character stated, a beater provided with arms, blades with slots on said arms, and bolts passing through said slots into said arms, in combination with a casing having openings in the wall thereof, blades in said openings projecting partly within and partly without said casing, shoulders on the exterior of said casing and means for adjustably connecting the blades of the casing with said shoulders.

697,229. ROLLERS FOR ROLLING AND ORNAMENTING SHEET OR FLAT GLASS. LEON APPEL, Paris, France. Filed Oct. 2, 1901. Serial No. 22,097. (No model.)

Claim.—1. In a device for ornamenting glass, a shaft with a longitudinal feather, and cylindrical ornamented disks or plates removably set on the said shaft and bolted together, the said disks having each a

notch to fit the feather on the shaft and holes for the passage of the bolts, as set forth.

2. A roller for ornamenting glass, consisting of a shaft with an exterior longitudinal feather, a plurality of cylindrical ornamented disks removably secured on said shaft and having notches to receive the feather, larger disks at the ends of said disks bearing against the ends of said feather and the adjacent disks and bolts passing through the end and intermediate disks and provided with nuts on their ends, substantially as shown and described.

697,230. DIAMOND-CROSS-CUTTING MACHINE. OTTO ADAM, New York, N. Y. Filed May 22, 1901. Serial No. 21,624. (No model.)

Claim.—1. In a diamond-cross-cutting machine, the combination of a cutting-disk, means for operating the same, a suitably-supported guide-rail arranged transversely to the cutting-disk, a traverse-disk guided on said guide-rail, a feed-disk guided on the traverse-disk in a line transverse to the line of travel of the traverse-disk, a clutch-holding device mounted on the feed-disk, a pulley at the inner end of the traverse-disk, a cord connected therewith and guided over said pulley, a weight suspended from said cord and movable with the traverse-disk, and means for connecting said cord at different points in its length with said feed-disk, substantially as set forth.

2. In a diamond-cross-cutting machine, the combination of a cutting-disk, means for operating the same, a guide-rail supported transversely to the cutting-disk, a traverse-disk guided on said guide-rail and provided with a channel at its upper part, a feed-disk guided on the traverse-disk parallel with said channel, a clutch-holding device on the feed-disk, a pulley at the inner end of the traverse-disk in line with said channel, a cord connected with the rear end of said feed-disk, in line with said channel, and passing through the latter and over said pulley, and a weight suspended from said cord and movable with said traverse-disk, substantially as set forth.

697,231. CONTRIBUTION BOX. EDWARD A. SUMM, Hartford, Conn. Filed Feb. 4, 1902. Serial No. 22,222. (No model.)

Claim.—1. In a collection-box, the combination, with a receptacle, of a cover, a false bottom for said cover, a handle, and means movably mounted on the handle for actuating the false bottom.

2. In a collection box, the combination, with a receptacle, of a cover, movable lid carried by said cover, a handle rigid with the receptacle; a movable device constructed to control the movement of said lid; and means carried by the handle for actuating said device.

3. In a collection-box, the combination, with a receptacle, of a pair of hinged lids; a handle; and means movably mounted on the handle for actuating said lids.

4. In a collection-box, the combination, with a receptacle, of a false bottom; steps for limiting the movement of said false bottom; a device for closing said false bottom; a handle; and means movable on said handle for actuating said device.

5. In a collection-box, the combination, with a receptacle, of a handle having a bore; a rod movably mounted in said bore; said rod movably connected to the receptacle; and means controlled by the rod for actuating the lid.

6. In a collection-box, the combination, with a receptacle, of a handle having a slot and a longitudinal bore communicating with the slot and the interior of the receptacle; of a rod mounted in said bore; a hand-group connected to the rod; a cover; a false bottom to said cover; and means controlled by the rod for actuating said false bottom.

7. In a collection-box, the combination, with a receptacle, of a handle having a slot; plates covering said slot; a rod; means for connecting said plates to the rod; and said rod controlled by the rod.

8. In a collection-box, the combination, with a receptacle, of a handle; a rod carried by said handle; a winged plate carried by said rod; and a false bottom actuated by said plate.

9. In a collection-box, the combination, with a receptacle, of a movable plate having a cam-surface; and a false bottom actuated by said plate.

10. In a collection-box, the combination, with a receptacle, of a movable cover; steps carried by said cover; a pair of lids hinged to the cover; steps carried by said lids; a handle; a rod carried in a bore of said handle; a movable plate having cam-surfaces, and carried by said rod; and cam-plates carried by said handle and connected to said rod.

11. In a collection-box, the combination, with a cover for said box, of a false bottom for said cover; a handle; and means movably mounted on the handle for controlling the movement of said false bottom.

12. In a collection-box, the combination, with a hinged cover constituting a hopper; of a false bottom for said cover; a handle; and means carried by the handle for actuating said false bottom.

13. In a collection-box, the combination, with a receptacle, of a cover movably mounted on said receptacle; a false bottom carried by the cover; and opening by gravity; and means for positively closing said false bottom.

14. In a collection-box, the combination, with a receptacle having a handle, of a cover hinged to said box; a false bottom composed of movably-mounted plates carried by the cover; a device having cam-surfaces for actuating said plates; and means carried by the handle for actuating said device.

15. A collection-box consisting of a receptacle; a false bottom; a handle; a device for closing said false bottom; and means movable on said handle for actuating said device.

16. A collection-box consisting of a receptacle; a false bottom opening by gravity; and upon which contributions may be deposited; a movable device for closing said false bottom; and means for actuating said movable device.

17. A collection-box consisting of a receptacle; a cover; a false bottom composed of plates movably connected to said cover; means for actuating said plates; and a device for actuating said means.

697,982. **SHERR, HARLOW F. CANT, Austinville, Iowa.** Filed July 17, 1901. Serial No. 63,605. (No model.)

Claim.—1. The combination, with a main frame, and a lever shear-blade secured at its front end; of an operating-lever pivoted against the side of the said frame, an upper shear-blade secured to the front end portion of the said lever and working against the lower shear-blade, an eccentric pivoted to the rear end portion of the main frame and provided with a handle which projects forwardly over the said blades, and means for holding the rear end portion of the said lever in contact with the said eccentric, substantially as set forth.

2. The combination, with a main frame provided with a projecting pivot and a slot at its rear end curved concentric with the pivot, and a

lower shear-blade secured to the front end portion of the said frame; of an operating-lever mounted on the said pivot and having a hole in its rear end portion, an upper shear-blade secured to the front end portion of the said lever, an eccentric pivoted to the rear end portion of the main frame and provided with a curved slot in its side and an operating-handle, and a removable bar which is slidable in the said curved slot of the frame and provided with projections at its ends which engage respectively with the hole of the lever and the slot of the eccentric, substantially as set forth.

697,983. **ANIMAL-TRAP. JAMES GRABBE, Torrington, Conn.** Filed Jan. 14, 1902. Serial No. 63,578. (No model.)

Claim.—1. A trap comprising a reservoir, a tilting platform covering the reservoir, a guard, a bait-holder and a runway leading to the platform, the surface of said runway being covered first with wire-netting and then with felt.

2. A trap comprising a reservoir, a tilting platform covering the reservoir, a guard at the back of the platform, a runway leading to the platform, a primary bait-holder and a secondary bait-holder back of and above the primary bait-holder so that an animal in attempting to reach it will tilt the platform and be thrown into the reservoir.

697,984. **FUEL BLOCK AND BRIOUET. FRANCIS CHASE, New York, N. Y., assignor to Standard Brick-Block Company, a Corporation of New Jersey.** Filed June 22, 1901. Serial No. 66,605. (No specimens.)

Claim.—1. A fuel block or briquet composed of compressed fuel and a binder containing an essential ingredient calcium silicate and alkali.

2. A fuel block or briquet composed of compressed fuel and a binder containing as ingredients calcium silicate, sodium silicate and dextrine, in substantially the proportions specified.

697,985. **GAS-HEATER. OLIN W. KATYMER, Indianapolis, Ind.** Filed Dec. 1, 1902. Serial No. 64,271. (No model.)

Claim.—1. In a heater, the combination of a burner having gas-emitting apertures, a second burner consisting of a hollow part located centrally above and smaller than the other burner, and having a substantially vertical surface in which are gas-emitting apertures, and a deflector above both of said burners, substantially as described.

2. In a heater, the combination with a part having substantially horizontal hollow arms provided with gas-emitting apertures, of a hollow part located centrally above said arms having a substantially vertical sur-

face in which are gas-emitting apertures, and a deflector above said parts, substantially as and for the purpose described.

3. In a heater, the combination with a part having substantially horizontal hollow arms provided with gas-emitting apertures, of a hollow part located centrally above said arms having a substantially vertical surface in which are gas-emitting apertures that are above the level of said first-mentioned apertures, and a deflector above said parts, substantially as and for the purpose described.

4. In a heater, the combination with a part having hollow arms radiating horizontally from a center, each arm having gas-emitting apertures, of a hollow part having a substantially vertical surface in which are gas-emitting apertures, that are above the level of said first-mentioned apertures, each part being located centrally above said arms, and a substantially circular horizontal deflector above said parts, substantially as and for the purpose described.

5. In a heater, the combination of a burner having gas-emitting apertures and provided with a centrally-disposed flange on its upper side, the gas-emitting apertures being outside of the flange, a second burner consisting of a hollow cylindrical part having gas-emitting apertures in its side and fitted over said flange, and a deflector for both of said parts supported by said hollow part, substantially as and for the purpose described.

697,986. **NORTHROP, THOMPSON, AND GROOVING MACHINE. JOHN CLARK, London, England.** Filed Jan. 26, 1902. Serial No. 61,337. (No model.)

Claim.—A hand mortising, tunneling and grooving machine comprising a table adjustable transversely and movable longitudinally by hand, provided with means of tilting and clamping the wood operated on, a hand-lever toothed wheel and rack for vertically reciprocating a piece adapted to hold a mortising-tool, a pair of transversely-sliding plane-holders with racks and gear worked by a loaded lever descending to an adjustable stop, and a pair of planes guided to reciprocate vertically, substantially as described.

697,987. **FRUIT-DRAINING TRAY. JAMES E. CHASE, Nashville, Tenn.** Filed Apr. 5, 1901. Serial No. 64,602. (No model.)

Claim.—1. The herein-described drying-frame composed of the corner-plates having the corner-blocks, and the legs depending therefrom and provided at their lower ends with tenons E, and having each corner-block, legs and tenons curved providing sockets in the upper end of the corner-blocks to receive tenons on a mating frame, each corner-plate being provided with upright side plates and with inwardly-projecting base-plates, the base and top rails fitting to said corner-plates and abutting at their ends against the corner-blocks, and the base-rails being supported at their lower ends on the base-flanges of the said corner-plates and hav-

ing in their upper ends rabbets extending from their inner edges, the frame-work bottom resting at its edges in said rabbets and below the top rails, and the bolts securing the parts together, substantially as and for the purpose set forth.

2. In a drying-frame, a corner-plate provided in its upper end with a socket and at its lower end with a depending leg adapted to rest upon the next lower corner-plate and having a projecting tenon to fit within and formed to turn in the socket of said next lower corner-plate when the frames are stacked together whereby in stacking the frames together, a projecting tenon on the uppermost frame may be fitted in the proper socket of the top frame of the pile and swing on said tenon as a pivot to bring the frame into full register with those already stacked, substantially as set forth.

3. A drying-frame composed of the rails, the corner-plates having seats for said rails, the frame-work bottom, the bracing-rail extending below said bottom between the sides of the frame, and the leg pivoted to said bracing-rail near the side of the frame and arranged for adjustment to elevate each side of the frame, substantially as set forth.

4. The combination in a drying-frame, of the corner-plates having corner-blocks and base and side flanges projecting therefrom and arranged to form seats for the rails, the base-rails fitted to said seats resting upon the base-flanges and abutting at their ends the corner-blocks, the frame-work bottom resting upon the base-rails, the top rails resting over the frame-work bottom, and the securing device, substantially as set forth.

5. A drying-frame comprising corner-plates, having upright portions and lateral horizontal end-plates for the rails, the rails secured upon the said end-plates, and a frame-work bottom, substantially as set forth.

6. A drying-frame comprising the rails, the frame-work bottom, the corner-plates having upright portions provided at one end with the sockets and at their other ends with the tenons, to enter the sockets of the next frame, and also provided with lateral seats for the rails, substantially as set forth.

697,988. **SWITCH-OPERATING DEVICE. THOMAS CURT, New Waterford, Ohio.** Filed Jan. 2, 1902. Serial No. 63,590. (No model.)

Claim.—In a switch-operating device, the combination with the car having a slot formed therein, of an operating-lever extending through said slot, a rod-shaft suitably mounted beneath the platform of the car, said

rock-shaft being rigidly secured to said lever, a rock-arm rigidly secured to said rock-shaft, a pair of downwardly-extending converging levers pivotally secured to the ends of said rock-arm, angularly-disposed shoes carried by the lower ends of said levers, a hanger secured to the under face of the platform, an outwardly-extending slotted guide rigidly secured to said hanger, said levers passing through the said slots formed in the guide, a pair of springs interposed between the said rock-shaft and the said guide, and a switch-tongue having a rod connected thereto with a head carried by the rod for engagement with said slots whereby the switch-tongue is actuated, substantially as described.

697,289. HOG-TROUGH. FRANK E. DAVIS, Audubon, Iowa. Filed Jan. 7, 1901. Serial No. 88,708. (No model.)

Claim.—1. In combination with a hog-trough, supports for adjustable fenders composed of boards fixed to uprights that project down over the ends of the trough, fenders adjustably connected with the supports, cleats fixed to the inside faces of the ends of the boards and the uprights and cleats jointly hinged to the fixed ends of the trough at one side of the trough and the uprights and cleats detachably fixed to the fixed ends at the other side of the trough as shown and described for the purposes stated.

2. In combination with a hog-trough, supports for adjustable fenders hinged to the fixed ends of the trough and provided with slots for the reception of pivots on the ends of fenders, steps fixed to the inside faces of the supports to engage fenders and rigid fenders composed of parallel side pieces and fixed cross-pieces and pivots at the ends of the fenders adapted to extend through and traverse said slots, as shown and described for the purposes stated.

3. In combination with a hog-trough, supports for adjustable fenders hinged to the fixed ends of the trough and provided with slots for the reception of pivots on the ends of fenders, steps fixed to the inside faces of the supports to engage fenders and rigid fenders composed of parallel side pieces and fixed cross-pieces and pivots at the ends of the fenders adapted to extend through and traverse said slots and solid roof-sections hinged to the supports above the slots to fold together to produce a roof and also to fold upward and downward relative to the trough as shown and described for the purposes stated.

4. In combination with a hog-trough, supports for adjustable roof-sections and adjustable fenders, adjustable roof-sections, adjustable fenders, tapering blocks fixed to the inside faces of said supports to rest on the trough, boards fixed to the tops of the blocks, fenders composed of straight bars and short bars fixed thereto and to the top edges of said fixed boards to engage the top edges of the sides of the trough, as shown and described for the purposes stated.

5. A hog-trough and hay-rick comprising a trough having supports for roof-sections and fenders hinged to the ends of the trough, slots in said hinged supports for pivots on the ends of fenders and steps at their tops to engage fenders, fenders composed of parallel side pieces and fixed cross-bars and fixed pivots, roof-sections hinged to the supports, tapering blocks fixed to the inside faces of the supports, boards fixed to the edges of the

blocks and fenders fixed to said boards and the top edges of the sides of the trough, all arranged and combined to operate in the manner set forth for the purposes stated.

697,240. ADVERTISING DEVICE. JOHN E. DUNBAR and JOHN G. KREMER, Buffalo, N. Y. Filed Jan. 24, 1901. Serial No. 44,610. (No model.)

Claim.—1. A plurality of advertising devices, a single shiftable operating-shaft extending through and having connection with all of said advertising devices, a motor, a reversing connection between the motor and operating-shaft and means for shifting said shaft.

2. An advertising device comprising an enclosing case, two rollers in said case, an advertising-ribbon on said rollers, a shifting operating-shaft adapted to operatively engage with either of the rollers, a motor and a reversing device connecting the shaft to the motor.

3. An advertising device comprising an enclosing case, two rollers in said case, an advertising-ribbon on said rollers, a shifting operating-shaft adapted to operatively engage with either of the rollers, a gear-wheel on the operating-shaft, a motor having a shaft, and reversing-gearing connecting the motor-shaft to the gear-wheel.

4. A car having a curved upper side provided with upper and lower recesses, a shifting operating-rod supported from the car, and a plurality of advertising devices having portions adapted to detachably fit in the recesses and slots for the passage of the shifting operating-rod; each of said slots having an inner enlarged opening to provide for the shifting movement of the rod.

697,241. WORM. FULFORD V. BURNER, Tarentum, Pa. Filed Jan. 14, 1902. Serial No. 89,723. (No model.)

Claim.—The combination with a handle having a toothed face and an integral jaw at one end, of a sliding jaw mounted on the handle and having a cut-away portion forming an arm at one end of the jaw, a worm mounted in the cut-away portion of the jaw, an operating-shaft pivoted at its inner end to the jaw and on which the worm is rotatably mounted, said shaft extending through an aperture provided therefor in the arm of the jaw and having a head on its outer end, a locking-sleeve mounted to slide on the shaft and engage in the aperture in the arm to retain the worm in engagement with the teeth of the handle, the said shaft being capable of swinging movement when the sleeve is withdrawn from the arm whereby the worm is disengaged from the teeth of the handle, and a spring on the shaft between its head and the sleeve to normally hold the sleeve in engagement with the arm, substantially as described.

697,242. HORSE-TAIL HOLDER. HARRY E. GAVITY, Topeka, Kans. Filed Nov. 4, 1901. Serial No. 81,004. (No model.)

Claim.—1. A horse-tail holder substantially as herein described, consisting of the main strap, the crupper-loop secured at one end to the upper end of the main strap, buckle devices for securing the other end of the crupper-loop to the main strap, a short strap secured in the crupper-loop near the buckled end thereof and arranged for adjustment into ring form for securing the hair from working down and a series of cross-straps secured to and ranging along the main strap below the crupper-loop and adapted for use, substantially as set forth.

2. A horse-tail holder provided with a loop for connection with the crupper whereby it may be supported within the folded-up tail of the animal and having at its upper end a strap for securing the tail at the upper returned portion thereof and provided below said strap with a series of cross-straps for securing the hair, substantially as set forth.

3. A horse-tail holder adapted to secure the tail in turned-up position and to be obscured from view within the folded tail when in use and provided with devices for connection with the harness, with a strap-loop to secure the returned portion of the tail and with a series of hair-securing straps whereby it may operate to so hold the tail as to cause it to prevent the appearance of being docked, substantially as set forth.

4. A horse-tail holder, comprising a main strap a transverse crupper-loop at the upper end of the main strap, a strap adjacent to the upper end of the main strap for securing the upper returned portion of the hair, and devices on the main strap for securing the hair below the upper returned portion thereof, substantially as set forth.

697,248. CART SHOVEL AND SCRAPER. ADAM GERRINGER, Philadelphia, Pa. Filed June 11, 1901. Serial No. 64,065. (No model.)

Claim.—1. In an apparatus of the character described, two traction-wheels secured to a common axle, a shovel or scraper pivoted upon said axle, two sets of sprocket-wheels, shafts upon which said sprocket-wheels are secured, said shafts extending across the interior of the shovel and journaled in each side thereof, uprights extending upward from each side of the shovel, arms extending forward from said uprights, a series of sprocket-wheels journaled upon said uprights and arms, continuous link belts, a series of buckets secured to said link belts at intervals, said link belts adapted to pass around and underneath the sprocket-wheels upon the interior of the shovel, and around and over the sprocket-wheels in the uprights and arms, said sprocket-wheels arranged so as to give the proper inclination to the belts at a certain point to cause the buckets to be emptied, a chute carried by the framework into which the buckets are adapted to empty, a vehicle adapted to be secured to said shovel, the said chute adapted to convey the dirt to said vehicle, means for transmitting power from the traction-wheels to revolve certain sprocket-wheels around which the chain passes so as to cause the chains and buckets to travel forward against the incoming dirt, substantially as described and for the purpose specified.

2. In combination, a cart shovel and scraper, two traction-wheels C, a shaft E, the ends of which are secured to the traction-wheels, a shovel or scraper A mounted upon the shaft E, a shaft F, the ends of which are journaled upon the inside of the sides of the shovel, sprocket-wheels secured upon the shaft F, sprocket-wheels G journaled upon the interior of the shovel, uprights extending upward from the sides of the shovel, arms extending forward from said uprights, sprocket-wheels H and I journaled in said uprights, sprocket-wheels K and L journaled in said arms,

continuous link belts adapted to pass around all of said sprocket-wheels, a series of buckets carried by said link belts, a vehicle adapted to be secured to said shovel, a chute carried by the framework, said chute adapted to convey the dirt emptied from said buckets into said vehicle, a gear-wheel K journaled loosely upon the shaft E, a gear-wheel T secured upon the shaft F and adapted to mesh with the gear-wheel K, a clutch fastened upon the shaft E and adapted to connect and disconnect the gear-wheel K with said shaft, means adapted to be operated from the exterior of the shovel for throwing said clutch in and out of engagement with the gear-wheel K, a handle secured to the rear end of the shovel for guiding the same, wheels D journaled in the forward end of the shovel upon each side thereof, substantially as described and for the purpose specified.

697,244. TOOL FOR MAKING, MENDING, AND SHARPENING ROCK-DRILLS. GILBERT J. STAMER, Leeds, England. Filed Sept. 3, 1901. Serial No. 74,080. (No model.)

Claim.—1. In a tool for making, mending and sharpening three-winged rock-drills the combination of a holder or block a having a vertical opening through it and an opening b through the front side, a bottom die c having a vertical recess l with parallel sides and inclined bottom chisel-forming faces e and taper-side-forming faces m inclined in the opposite longitudinal direction to the incline of the faces e and a top die d having chisel-forming faces p taper-side-forming faces n inclined in the opposite longitudinal direction to the incline of the faces p and edge-forming surfaces q, the cooperating dies b and c fitting freely in the said vertical opening all substantially as and for the purposes herein set forth and illustrated.

2. In a tool for making, mending and sharpening rock-drills the combination of a block a with vertical and side openings, cooperating top and bottom dies b and c fitting freely in said vertical opening, side pins or studs e attached to the top die, springs f, and hinged forked-ended levers g g all substantially as and for the purpose or purposes set forth and illustrated.

3. In a tool for making, mending and sharpening three-winged rock-drills the combination on the working faces of bottom and top cooperating dies c and b of a vertical recess l having parallel sides and inclined bottom, chisel-forming faces e taper-side-forming faces m inclined in the opposite direction longitudinally to the incline of the faces e in the bottom die, and chisel-forming faces p, taper-side-forming faces n inclined in the opposite direction longitudinally to the incline of the faces p and edge-forming faces q in the top die respectively all substantially as and for the purpose or reasons set forth and illustrated in the accompanying drawings.

697,245. MATCH-BOX. EUGENE GREENGLASS, Brooklyn, Pa. Filed Jan. 7, 1902. Serial No. 81,312. (No model.)

Claim.—1. In a match-box, a receptacle having inwardly-extending walls therein, an agitator mounted within said receptacle, a roller having a groove therein located within the receptacle, and means to operate the roller and agitator simultaneously.

2. In a match-box, the combination of a base, a match-receptacle mounted thereon, an agitator secured in said receptacle, inclined walls formed in said receptacle having a space therebetween, a roller having a groove formed therein secured in said receptacle, a segmental cog-wheel, a spring-pressed lever connected with said agitator, said lever bearing against said segmental cog-wheel, a cog-rack, an operating-lever connected to said rack, and means whereby said mechanism is returned to its normal position, all parts being arranged and operating substantially as described.

697,246. MECHANISM FOR MEASURING AND RECORDING MEASUREMENTS OF MATERIAL. JAMES HALL, Leeds, England. Filed May 3, 1901. Serial No. 68,068. (No model.)

Claim.—1. In a machine for measuring material such as skin and the like, the combination with the measure-indicating mechanism of a series of printing-drums and means for simultaneously imprinting the results attained onto the skin or the like and on a moving tape or strip substantially as described.

2. In a machine of the class specified, the combination of a series of printing-drums and means for pressing an intermittently-moving tape or strip against one set to receive the impression to which the types have been adjusted and means for depressing another set to imprint the same impression on the material being measured substantially as described.

3. In a machine of the class specified, the combination of type-drums mounted on the measure-indicating spindle, means for intermittently moving a tape or strip of material past the said drums, a series of swingingly-supported type-drums mounted above the material being treated, means for adjusting the same from the indicating-spindle and means for pressing the tape or band against the first set of drums and simultaneously depressing the swingingly-mounted set onto the material after it has passed the measuring-rolls in the manner and for the purpose substantially as described.

4. In a machine of the class specified, the combination of a pair of type-drums mounted on the indicating-spindle, an intermittently-moving tape or band mounted in proximity thereto, one of said type-drums having a scale of measures and the other having current numbers, an ink-pad mounted at the rear of said tape and means for projecting the same against the type-drum, a second set of two type-drums mounted above the delivery-table of the machine and corresponding to the first-mentioned set, means for adjusting them simultaneously with the latter and for depressing them, when adjusted down onto the material on the delivery-table, and means for turning the disk with the current numbers one number after each impression substantially as described.

5. In a machine of the class specified, the combination of type-drums on the indicating-spindle, one of which has the scale of measures and is rotated with said spindle, and the other being loosely mounted thereon, a lever mechanism consisting of a piston with inking-pad thereon movable toward and from the said type-drum, a hand-lever to project the same toward the said drum, and a rock-lever connected to said piston draw-rolls to intermittently move a band or tape past the said drums between them and the said pad, and pawls to the said rock-lever to move one of the said rolls and the loosely-mounted type-drum at each oscillation of the said rock-lever substantially as described.

6. In a machine of the class specified, the combination of a set of type-drums on the indicating-spindle, means for adjusting one to the dimension of the skin or material being treated, and means for adjusting the other one step farther forward at each operation of the first drum, a corresponding set of type-drums mounted above the delivery-table and means for depressing the same onto the said table, a yielding frame, to connect the spindle of the indicating mechanism with that of the set of type-drums above the delivery-table, and chain-wheels and chains to couple the corresponding type-disks of each set to each other in the manner said for the purpose substantially as described.

7. In a machine of the class specified, the combination of a set of type-drums and means in connection with the same for imprinting the types adjusted by the passage of the material through the machine, onto an intermittently-moving tape or band, a second set of type-drums mounted above the delivery table and means for depressing the same down onto the table, a hand-lever and means in connection therewith for pressing the tape onto the first set of drums and for depressing the second set down

on the table when the said lever is moved and a lever system operated by the further movement of the said hand-lever to throw the dot-marks of the measuring-quadrants out of engagement as soon as the recording-disks have been operated substantially as described.

697,247. INDIVIDUAL COMMUNION-SERVICE. CALVIN F. HARRIS, New York, N. Y., assignor to Reed and Barton Corporation, Taunton, Mass. Filed Dec. 3, 1901. Serial No. 35,918. (No model.)

Claim.—1. An individual communion-service comprising a tray formed with a plurality of steps adapted to support the bottoms of the glasses, and a cover stepped to conform to the tray and formed with glass-receiving openings, and a lining for the cover formed with openings of less diameter than those in the cover, to support the glasses intermediate their ends.

2. An individual communion-service comprising a tray formed with steps, pads on said steps upon which the bottoms of the glasses rest, a removable cover stepped to conform to the tray and formed with openings, and a lining for said cover having openings of less diameter than those in the cover.

3. An individual communion-service comprising a tray formed with a plurality of steps or platforms, a removable cover for the tray provided with steps or platforms each having a row of openings, and a lining for said cover formed with openings of less diameter than the openings in the cover, but registering therewith to afford supporting-pads for glasses extending through said openings.

4. An individual communion-service comprising a tray formed with a plurality of annular steps or platforms, and a central platform; a removable cover having steps or platforms conforming to those of the tray and formed with glass-receiving openings, means for securing the cover upon the tray; pads resting on the tray-platforms, and a lining for the cover formed with openings registering with the openings of the cover but of less diameter than the latter.

5. An individual communion-service comprising a tray having a plurality of steps or platforms, to support glasses, and a central platform, a cover having steps or platforms conforming to those of the tray and formed with glass-receiving openings, pads surrounding the tray-openings and a centrally-arranged screw for detachably securing the cover in position.

6. An individual communion-service comprising a tray formed with annular steps or platforms, a central platform, and an annular shoulder; a cover having platforms conforming to those of the tray, glass-receiving openings, and an annular depending flange resting on said shoulder, means for securing the cover in position, and a lining for said cover having openings registering with those of the cover but of less diameter than the latter.

697,248. FIGURE TOY. ANNA E. HAWLEY, Manchester, Vt. Filed Feb. 2, 1901. Serial No. 46,711. (No model.)

Claim.—1. In a toy of the class described, a cradle, a motor, a direct connection between the motor and cradle whereby the latter is rocked, a figure having no direct connection with the motor, and an arm of rigid material operatively connecting the body of the figure and the cradle, all substantially as set forth, whereby the motor that moves the cradle and connection also moves the figure bodily through the medium of the cradle.

2. In a toy of the class described, a cradle, a jointed figure detachably connected to the cradle, a standard, spring-clip to hold the figure detachably to the standard, a motor to rock the cradle and move the figure, and a spring-stop bearing on the body of the figure opposite the cradle to limit the motion of said body.

697,949. BLAST-FURNACE. GEORGE F. HERRICK, New York.
N. Y. Filed Oct. 1, 1901. Serial No. 77,908. (No model.)

Claim.—1. Apparatus for preventing escape of dust from blast-furnaces, comprising in combination with the furnace and concentric hopper and an outwardly-directed stock-distributor situated at the top of the furnace, a dust-chamber situated between the stock-line and the off-charge-pipe enlarged transversely to the direction of natural flow of the gases and prolonged upwardly, said dust-chamber opening downwardly and freely into the furnace below the hopper, and an off-charge-pipe leading to a place of use and situated at such distance from the stock-line that the particles of dust to be retained in the furnace shall be checked before reaching said off-charge-pipe; substantially as described.

2. Apparatus for preventing escape of dust from blast-furnaces comprising in combination with the furnace and concentric hopper and an outwardly-directed stock-distributor situated at the top of the furnace, a dust-chamber situated between the stock-line and the off-charge-pipe, enlarged transversely to the direction of the natural flow of the gases and prolonged upwardly, said dust-chamber opening downwardly and freely into the furnace below the hopper and forming a passage for the gases at some part substantially vertical; substantially as described.

3. Apparatus for preventing escape of dust from blast-furnaces comprising in combination with the furnace, hopper and concentric outwardly-directed stock-distributor situated at the top of the furnace, a dust-chamber enlarged transversely relatively to the furnace-throat, prolonged vertically above the hopper and opening freely at its base into the furnace,

and an off-charge-pipe leading to a place of use from the dust-chamber at such elevation that the particles of dust to be retained in the furnace shall be checked before reaching said off-charge-pipe; substantially as described.

4. Apparatus for preventing escape of dust from blast-furnaces, comprising in combination with the furnace and an outwardly-directed stock-distributor situated at the top of the furnace, a dust-chamber prolonged upwardly above the stock-line enlarged transversely relatively to the furnace-throat, and opening freely at its base into the furnace below the level of the charging-opening, and an off-charge-pipe leading to a place of use from the dust-chamber at such elevation that the particles of dust to be retained in the furnace shall be checked before reaching said off-charge-pipe; substantially as described.

5. Apparatus for preventing escape of dust from blast-furnaces, comprising in combination with the furnace, a concentric charging device and outwardly-directed stock-distributor situated at the top of the furnace, a dust-chamber prolonged upwardly at the top of the furnace and enlarged transversely relatively to the furnace-throat, said dust-chamber having its blast-inlet solely from the furnace and opening downwardly and freely into the furnace below the charging-opening, and an off-charge-pipe; substantially as described.

6. Apparatus for preventing escape of dust from blast-furnaces, comprising in combination with the furnace, a dust-chamber at the top of the furnace, a concentric charging-opening, and a transverse passage leading to the charging-opening, said dust-chamber extending above said passage; substantially as described.

7. Apparatus for preventing escape of dust from blast-furnaces, comprising in combination with the furnace, a concentric charging device, and an outwardly-directed stock-distributor situated at the top of the furnace, a dust-chamber prolonged upwardly at the top of the furnace and enlarged transversely relatively to the furnace-throat, said dust-chamber having its blast-inlet solely from the furnace and opening downwardly and freely into the furnace through an opening or openings through which the dust enters from and returns to the furnace, and an off-charge-pipe leading to a place of use; substantially as described.

8. Apparatus for preventing escape of dust from blast-furnaces, comprising in combination with the furnace and a bell-charging device situated at the top of the furnace, a dust-chamber situated at the top of the furnace and opening downwardly and freely into the furnace, said chamber being prolonged vertically and also enlarged horizontally relatively to the throat of the furnace, and an off-charge-pipe situated above the charging-opening of the furnace and leading to a place of use; substantially as described.

9. In combination with a blast-furnace, a dust-chamber situated above the stock-line opening downwardly and freely into the furnace, prolonged upwardly at the top of the furnace-stack and enlarged transversely to the direction of the natural flow of the gases and relatively to the furnace-throat, an off-charge-pipe having its mouth vertically above the dust-chamber and a charging device situated vertically above the furnace-stack and constructed to deflect the gases outwardly in their course to the off-charge-pipe; substantially as described.

10. Apparatus for preventing escape of dust from blast-furnaces comprising in combination with the furnace, hopper and concentric outwardly-directed stock-distributor situated at the top of the furnace, and constructed to deflect the gases outwardly, a dust-chamber enlarged transversely relatively to the furnace-throat, prolonged upwardly at the top of the furnace and opening freely at its base into the furnace, and an off-charge-pipe leading to a place of use from the dust-chamber at such elevation that the particles of dust to be retained in the furnace shall be checked before reaching said off-charge-pipe; substantially as described.

697,950. WRITING-MACHINE. EDWARD R. HERR, Brooklyn, N. Y., assignor to Mechanical Improvements Company, New York, N. Y., a Corporation of New York. Filed Dec. 20, 1901. Serial No. 77,707. (No model.)

Claim.—1. The combination of a pivoted type-bar, a back-stop upon which it normally lies, a type-bar-actuating connection adapted to be

10. The combination of a pivoted type-bar normally lying toward the front of the machine, an actuating connection arranged under the type-bar and comprising two members united by a flexing joint and one of which is operatively connected to the type-bar, a fixed axis about which

19. The combination of a pivoted type-bar, a type-bar-actuating con-

26. The combination of a pivoted type-bar, its operating connection comprising two members united by a flexing joint, and one of which is operatively connected to the type-bar; a stationary axis about which the other rocks, the connection being arranged substantially in a straight line between the stationary axis and the point of connection with the type-bar; a stop locking the connection against flexure in one direction, to resist the tendency of the type-bar to rebound after it has completed its excursion from the printing-point; a finger-piece, and means, on the depression of the finger-piece, for flexing the connection in opposite direction, to throw the type-bar to the printing-point.

22. The combination of a pivoted type-bar, normally lying toward the front of the machine; a type-bar-extending connection arranged under the type-bar and comprising two links united by a flexing joint, and one of which is operatively connected to the type-bar; a stationary axis about which the other link rocks, the connection being arranged substantially in a straight line between said axis and the point of connection with the type-bar, but with the flexing joint to one side of said line; a stop locking the connection against further flexure on the same side of the line; a spring applied directly to the link rocking about the stationary axis, and tending to hold the connection in its normal position; a finger-piece, and

means, situated by the finger-piece and connected to said connection between the stationary axis and the type-bar, for flexing the connection on the opposite side of said line, to throw the type-bar to the printing-point.

34. The combination of a pivoted type-bar, normally lying toward the front of the machine; a type-bar-actuating connection arranged under the type-bar and comprising two links united by a flexing joint, and one of which is operatively connected to the type-bar; a stationary axis about which the other link rocks, the connection being arranged substantially in a straight line between said axis and the point of connection with the type-bar, but with the flexing joint to one side of said line; a stop limiting the connection against further flexure on the same side of the line; a key-lever arranged below said connection, and means interposed between the key-lever and said connection at a point between the type-bar and the stationary axis for, on the depression of the key-lever, flexing said connection on the other side of said line, to throw the type-bar to the printing-point.

35. The combination of a pivoted type-bar, normally lying toward the front of the machine; a type-bar-actuating connection arranged under the type-bar and comprising two links united by a flexing joint, and one of which is operatively connected to the type-bar; a stationary axis about which the other link rocks, the connection being arranged substantially in a straight line between said axis and the point of connection with the type-bar, but with the flexing joint to one side of said line; a stop limiting the connection against further flexure on the same side of the line; a spring applied directly to the link rocking about the stationary axis, and tending to hold the connection in its normal position; a key-lever arranged below said connection, and means interposed between the key-lever and said connection at a point between the type-bar and the stationary axis for, on the depression of the key-lever, flexing said connection on the other side of said line, to throw the type-bar to the printing-point.

36. In a front-stroke or visible-writing machine, the combination of the type-bar segment, type-bars pivoted therein and normally lying toward the front of the machine; type-bar-actuating connections, one for each type-bar, each composed of two links united by a flexing joint, and one of which is operatively connected to its type-bar, a stationary axis toward the front of the machine about which the other link rocks, the several stationary axes being arranged in a space of greater transverse width than that occupied by the type-bar segment, and these at the sides of the central one being placed at varying inclinations to a vertical longitudinal plane, the inclination increasing toward the ends of the series, so that the type-bar-actuating connections, as a whole, constitute a converging series; a stop for limiting flexure of each said connection in a direction to resist the strain of rebound of its type-bar; key-levers horizontally disposed beneath the type-bar-actuating connections, and means interposed between the key-levers and each connection to flex them in the opposite direction, to throw the type-bar to the printing-point.

37. In a front-stroke or visible-writing machine, the combination of the type-bar segment, type-bars pivoted therein and normally lying toward the front of the machine; type-bar-actuating connections, one for each type-bar, each composed of two links united by a flexing joint, and one of which is operatively connected to its type-bar, a stationary axis toward the front of the machine about which the other link rocks, the several stationary axes being arranged in a space of greater transverse width than that occupied by the type-bar segment, and these at the sides of the central one being placed at varying inclinations to a vertical longitudinal plane, the inclination increasing toward the ends of the series, so that the type-bar-actuating connections, as a whole, constitute a converging series; a stop for limiting flexure of each said connection in a direction to resist the strain of rebound of its type-bar; key-levers arranged below the type-bar-actuating connections, and a device or link interposed between each key-lever and the corresponding type-bar-actuating connection, at a point in the latter intermediate the type-bar and the stationary axis.

38. In a front-stroke or visible-writing machine, the combination of the type-bar segment, type-bars pivoted therein and normally lying toward the front of the machine; type-bar-actuating connections, one for each type-bar, each composed of two links united by a flexing joint, and one of which is operatively connected to its type-bar, a stationary axis toward the front of the machine about which the other link rocks, the several stationary axes being arranged in a space of greater transverse width than that occupied by the type-bar segment, and these at the sides of the central one being placed at varying inclinations to a vertical longitudinal plane, the inclination increasing toward the ends of the series, so that the type-bar-actuating connections, as a whole, constitute a converging series; a stop for limiting flexure of each said connection in a direction to resist the strain of rebound of its type-bar; a spring applied to one of the links and tending to hold the type-bar-actuating connection in its normal position, in which it looks the type-bar against rebound; key-levers horizontally disposed beneath the type-bar-actuating connections,

and means interposed between the key-levers and each connection to flex them in the opposite direction, to throw the type-bar to the printing-point.

39. In a front-stroke or visible-writing machine, the combination of the type-bar segment, type-bars pivoted therein and normally lying toward the front of the machine; type-bar-actuating connections, one for each type-bar, each composed of two links united by a flexing joint, and one of which is operatively connected to its type-bar, a stationary axis toward the front of the machine about which the other link rocks, the several stationary axes being arranged in a space of greater transverse width than that occupied by the type-bar segment, and these at the sides of the central one being placed at varying inclinations to a vertical longitudinal plane, the inclination increasing toward the ends of the series, so that the type-bar-actuating connections, as a whole, constitute a converging series; a stop for limiting flexure of each said connection in a direction to resist the strain of rebound of its type-bar; a spring applied to one of the links and tending to hold the type-bar-actuating connection in its normal position, in which it looks the type-bar against rebound; key-levers arranged below the type-bar-actuating connections, and a device or link interposed between each key-lever and the corresponding type-bar-actuating connection, at a point in the latter intermediate the type-bar and the stationary axis.

40. The combination of a pivoted type-bar, its actuating connection comprising two members united by a flexing joint, and one of which is operatively connected to the type-bar; a stationary axis about which the other rocks; a spring applied to the latter intermediate the stationary axis and flexing joint, and normally tending to deflect said joint to one side of a straight line between said axis and the point of connection with the type-bar; a stop for limiting movement in that direction to thereby look the type-bar against rebound; a finger-piece, and means, on the depression of the finger-piece, for flexing said connection on the opposite side of the straight line, to throw the type-bar to the printing-point.

41. The combination of a pivoted type-bar, its actuating connection comprising two members united by a flexing joint, and one of which is operatively connected to the type-bar; a stationary axis about which the other rocks; a coiled spring applied to the latter intermediate the stationary axis and flexing joint, and normally tending to deflect said joint to one side of a straight line between said axis and the point of connection with the type-bar; a stop for limiting movement in that direction to thereby look the type-bar against rebound; a finger-piece, and means, on the depression of the finger-piece, for flexing said connection on the opposite side of the straight line, to throw the type-bar to the printing-point.

42. In a front-stroke or visible-writing machine the combination of a pivoted type-bar normally lying toward the front of the machine; a horizontally-disposed key-lever arranged below the type-bar; a flexing type-bar-actuating connection intermediate the type-bar and key-lever, and extending between the head of the type-bar and a stationary axis toward the front of the machine; a link independent of the key-lever for limiting its flexure in a direction to resist rebound of the type-bar, and an operative connection between the key-lever and the type-bar-actuating connection to flex the latter in the opposite direction, to throw the type-bar to the printing-point.

43. In a front-stroke or visible-writing machine, the combination of a type-bar segment, type-bars pivoted therein and normally lying toward the front of the machine; a flexing connection for operating the type-bar, comprising two members, one operatively connected with the type-bar, and the other rocking about an axis fixed in the frame of the machine, said connection being locked against movement in one direction relatively to said axis to look the type-bar against rebound, and free to rock in the other direction to throw the type-bar to the printing-point.

44. In a visible-writing machine, the combination of a type-bar segment, type-bars pivoted therein, flexing connections, one for each type-bar, each comprising two members united by a hinge-joint, the rear one being operatively connected to the type-bar and the front one to a stationary axis, the assemblies of flexing connections diverging from the front of the machine toward the type-bar segment and lying in a transverse curve or segment, means whereby the flexing connections are locked to prevent rebound of the type-bars from their back stops or rests and means for actuating the flexing connections to throw the type-bars to the printing-point.

45. In a visible-writing machine, the combination of a type-bar segment, type-bars pivoted therein, flexing type-bar-actuating connections disposed horizontally radially and in a transverse curve, means for locking them to prevent rebound of the type-bars from their back stops or rests and means for actuating them to throw the type-bars to the printing-point.

46. The combination of a pivoted type-bar, a flexing connection for actuating it comprising two members connected by a flexing joint, one of which is operatively connected to the type-bar and the other to a stationary axis about which it rocks and a spring acting to return the parts to normal position, and so applied directly to the flexing connection that

while its tension is increased during the extension of the type-bar to the printing-point the leverage of its reactionary pull is decreased.

47. The combination of a pivoted type-bar, its actuating device normally locked to prevent rebound of the type-bar from its rest and a spring so applied to the actuating device that while its tension is increased during the extension of the type-bar to the printing-point, the leverage of its reactionary pull is decreased.

48. The combination of a pivoted type-bar, its decreasing-leverage-actuating device acting to impart an increasing acceleration to the type-bar and a spring coacting with said device and so applied directly thereto that its tension is increased and the leverage of its pull decreased during the extension of the type-bar to the printing-point.

49. The combination of a pivoted type-bar, its decreasing-leverage-actuating device normally locked to prevent rebound of the type-bar from its back stop or rest and acting to impart an increasing acceleration to the type-bar and a spring coacting with said device and so applied directly thereto that its tension is increased and the leverage of its pull decreased during the extension of the type-bar to the printing-point.

50. The combination of a pivoted type-bar, a link connected thereto by a universal joint, means for actuating the link with a decreasing leverage to move it endwise and change its angular relation to the type-bar whereby the type-bar is thrown to the printing-point with an accelerating speed, and a spring so applied to said device that its tension is increased and its leverage decreased during the extension of the type-bar to the printing-point.

51. The combination of a pivoted type-bar, a link connected thereto by a universal joint, means for actuating the link with a decreasing leverage to move it endwise and change its angular relation to the type-bar whereby the type-bar is thrown to the printing-point with an accelerating speed, means for locking the device in normal position to resist and prevent rebound of the type-bar from its back stop or rest and a spring so applied to said device that its tension is increased and its leverage decreased during the extension of the type-bar to the printing-point.

52. The combination of a pivoted type-bar, its actuating device comprising two members arranged end to end and connected by a flexing joint, one operatively connected to the type-bar and the other rocking about a stationary axis, a link arranged transversely thereto, a key-lever for operating it to flex said joint in one direction to throw the type-bar to the printing-point and means for locking the joint against flexure in the opposite direction to thereby prevent rebound of the type-bar from its back stop or rest.

53. The combination of a pivoted type-bar, its horizontally-arranged actuating device capable of moving upwardly and downwardly as the type-bar moves toward and from the printing-point and a stop to prevent movement vertically from the normal position and thereby lock the type-bar against its rest.

54. The combination of a pivoted type-bar, a link loosely connected therewith, a decreasing-leverage device acting to move the link endwise with a pull and at the same time change its angular position, a key-lever, a connection between the key-lever and the decreasing-leverage device, a spring whose reaction tends to hold the parts in normal position and the tension of which is increased but the leverage of its pull decreased during the depression of the key-lever and the consequent extension of the type-bar to the printing-point and means for locking said link against strain of rebound of the type-bar from its rest.

55. In a front-stroke or visible-writing machine, the combination of the type-bar segment, type-bars pivoted therein, horizontally-arranged flexing type-bar-actuating connections, horizontally-arranged key-levers, vertically-arranged springs tending to urge the connections upwardly and locking-stops for preventing rebound of the type-bars from their rests and against which the springs tend normally to draw the connections.

56. In a front-stroke or visible-writing machine, the combination of a type-bar segment, type-bars pivoted therein and normally lying toward the front of the machine, flexible connections extending from the type-bars toward the front of the machine and horizontally and radially arranged, means for locking them against flexure to prevent rebound of the type-bars from their rests, springs for maintaining the lock and means for actuating the connections to throw the type-bars to the printing-point.

57. In a front-stroke or visible-writing machine, the combination of a type-bar segment, type-bars pivoted therein and normally lying toward the front of the machine, flexible connections extending from the type-bars toward the front of the machine and horizontally, radially and segmentally arranged, means for locking them against flexure to prevent rebound of the type-bars from their rests, springs for maintaining the lock and means for actuating the connections to throw the type-bars to the printing-point.

58. In a front-stroke or visible-writing machine, the combination of a series of type-bars arranged in a segment or curve and locked to prevent rebound from their back stops or rests, a series of flexing connections for operating the type-bars, correspondingly segmentally arranged

at their rear ends and at their front ends rocking about fixed axes and means for unlocking the bars and throwing them to the printing-point on the depression of their corresponding finger-pieces.

59. In a front-stroke or visible-writing machine, the combination of type-bars arranged in a curve or segment and locked against rebound from their back stops or rests and each having multiple type or characters thereon, flexing connections each composed of two links placed end to end and united by a flexing joint and arranged substantially in the same horizontal plane, a platen and means for changing the relation between the type-bars and the platen.

60. In a front-stroke or visible-writing machine, the type-bars arranged in a curve or segment and locked against rebound from their back stops or rests, flexing connections connected thereto and each comprising a decreasing-leverage member attached to another member by a universal joint and both members lying in substantially the same horizontal plane, and means for actuating the flexing connections to throw the type-bars to the printing-point.

61. In a front-stroke or visible-writing machine, the combination of type-bars arranged in a curve or segment, flexing connections each attached at one end to its type-bar and at the other end to a fixed point or part in the machine and comprising a decreasing-leverage member, and a decreasing leverage spring, the reaction of which tends to maintain the parts in normal position.

62. In a front-stroke or visible-writing machine, the combination of a pivoted type-bar, a link coupled therewith by a universal joint and subjected to tensile strain only on the extension of the type-bar, a decreasing-leverage link or member connected with the first-named link by a universal joint, a third link or member arranged transversely to both of the other two links, means for locking the two first-named links to hold the type-bar against its back stop or rest and a key-lever on the depression of which the type-bar is unlocked and thrown to the printing-point.

63. In a writing-machine, the combination of a normally locked part to be actuated, a flexing actuating connection, comprising links hinged together at their adjacent ends extending between said part and a fixed point and adapted when flexed to actuate said part with a pull, a finger-piece, and a flexible connection between the finger-piece and said actuating connection, intermediate its fixed point and the part to be actuated.

64. In a writing-machine, the combination of a type-bar segment, normally locked type-bars pivoted therein and normally lying toward the front of the machine, flexing actuating connections, acting substantially as described, extending from and under the type-bars to fixed points at the front part of the machine, finger-pieces and connections between the finger-pieces and each actuating connection.

65. In a writing-machine, the combination of a platen and segment, normally locked type-bars pivoted in the segment and normally lying toward the front of the machine, flexing actuating connections, acting substantially as described, extending from and under the type-bars to fixed points at the front part of the machine, finger-pieces and flexible connections between the finger-pieces and each actuating connection.

66. In a writing-machine, the combination of a flexing connection extending from a normally locked movable part to be actuated to a fixed point, a link having its upper end connected to said flexing connection intermediate its ends, and an actuating device to which the lower end of the link is connected, the operation being substantially as described.

67. In a writing-machine, the combination of a flexing connection extending from a normally locked movable part to be actuated to a fixed point and comprising links united at their adjacent ends by a hinge-joint, a third link whose upper end is hinged to the flexing connection intermediate its ends and an actuating device to which the lower end of the link is connected, the operation being substantially as described.

68. In a writing-machine, the combination of a flexing connection extending from a normally locked movable part to be actuated to a fixed point and comprising two links united at their adjacent ends by a hinge-joint, a third link hinged at one end to the connection in line with said joint, and an actuating device by which the other end of the link is depressed, the operation of the flexing connection being substantially as described.

69. In a writing-machine, the combination of a normally locked pivoted type-bar, a flexing connection operatively connected at one end to the type-bar and at the other end to a fixed point and comprising two links united at their adjacent ends by a hinge-joint, a third link hinged at one end to the connection in line with said joint, and an actuating device by which the other end of the link is depressed, the operation of the flexing connection being substantially as described.

697,951. CASE-PRESS. James H. Housman, Dayton, Ohio, assigner in Deeds to Iron and Brass Works, Dayton, Ohio, a Corporation of Ohio. Filed Sept. 7, 1901. Serial No. 74,009. (No model.)

Claim.—1. In a press, a cage comprising an inner perforated cylinder provided with exterior longitudinal grooves, and an outer metal casing shrunk upon said cylinder.

2. In a press, a cage comprising an inner perforated cylinder provided with exterior longitudinal grooves and a series of superposed rings surrounding said cylinder.

3. In a press, a cage comprising an inner integral perforated cylinder having a series of longitudinal grooves cut in its outer surface, and a series of superposed rings shrunk upon said cylinder.

4. In a press, a cage comprising an inner perforated cylinder provided with exterior longitudinal grooves, and an outer metal casing surrounding said cylinder.

5. In a press, in combination with a cage having an inner perforated cylinder and longitudinal grooves, a ram-block having its upper face grooved and provided with a chamber having lateral outlets leading to the exterior of the ram-block and with ducts leading from said chamber to the upper face of said block and communicating with the grooves therein.

6. In a press, in combination with a cage having an inner perforated cylinder and longitudinal grooves, a ram-block having its upper face provided with intersecting cross-grooves, and having a chamber provided with lateral outlets leading to the exterior of the ram-block and ducts leading from said chamber to the upper face of said block at the intersection of the grooves therein.

7. In a press of the character described, a ram-block having its upper face provided with circular and intersecting cross-grooves, and having a chamber provided with lateral outlets leading to the exterior of the ram-block and ducts leading from said chamber to the upper face of said block at the intersection of said grooves.

8. In a press, in combination with the upper and lower plunger, one of said plungers being movable and carrying a ram-block, a platform extending between said plungers and having two openings, one of said openings being in line with said plunger, whereby the ram-block may work therethrough, and a cage mounted to travel on said platform and register with said openings.

697,252. VEHICLE-WHEEL. EDWARD HUBBARD, Templeton, Mass. Filed Jan. 12, 1902. Serial No. 66,904. (No model.)

Claim.—1. The combination, with a vehicle-wheel; of a wooden tire formed of sections, the grain of which is disposed substantially at right angles with the peripheral line of said tire, each of said sections having an annular groove for receiving the wheel-rim; and a pair of annular

members disposed at opposite sides of and engaging the tire and the wheel-rim, and the outside diameter of which is substantially equal to that of the tire.

2. The combination, with a vehicle-wheel; of a wooden tire formed of sections the grain of which is disposed substantially at right angles with the peripheral line of said tire, each of said sections having an annular groove for receiving the wheel-rim; and a pair of metallic members disposed at opposite sides of and for reinforcing said tire laterally, said members having annular projections on their inner faces; and means for forcing said members together and thus drive the projections into the tire laterally of the grain thereof.

3. The combination, with a vehicle-wheel; of a wooden tire formed in sections, the grain of which is disposed substantially at right angles with the peripheral line of said tire, each of said sections having an annular groove for receiving the wheel-rim; and a pair of sectional metallic members disposed and overlapping each other, at opposite sides of, and for reinforcing, said tire, laterally, said members having annular projections on their inner faces; and means for forcing said members together and thus drive the projections into the tire laterally of the grain thereof.

697,253. WARP STOP-MOTION FOR LOOMS. EMERY J. JARRE, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a Corporation of Massachusetts. Filed Dec. 12, 1901. Serial No. 66,346. (No model.)

Claim.—1. In a warp stop-motion for looms having two sets of drop bars or wires, and a lease-rod outside of each set, to divide the warp-threads into two planes, a warp-supporting rod or rest between the two sets of drop bars or wires, to support all the warp-threads, and a warp-supporting rod or rest on the outside of each set of drop bars or wires, and inside of the lease-rod, to support the lower planes of the warp-threads, so that the warp-threads will have a support at each side of the drop bars or wires, substantially as shown and described.

2. In a warp stop-motion for looms having two sets of drop bars or wires, and a lease-rod outside of each set, to divide the warp-threads into two planes, a warp-supporting rod or rest between the two sets of drop bars or wires, to support all the warp-threads at their point of intersection, and a warp-supporting rod or rest on the outside of each set of drop bars or wires, and inside of the lease-rod, to support the lower planes of the warp-threads, substantially as shown and described.

3. In a warp stop-motion for looms having two sets of drop bars or wires, and a lease-rod outside of each set, to divide the warp-threads into two planes, the combination with the two and plates of the frame, of a warp-supporting rod or rest between the two sets of drop bars or wires, to support all the warp-threads, and a warp-supporting rod or rest on the outside of each set of drop bars or wires, and inside of the lease-rod, to support the lower planes of the warp-threads, substantially as shown and described.

4. In the warp stop-motion of a loom having two sets of drop bars or wires, and a lease-rod outside each set, to divide the warp-threads into two planes, the combination with brackets or arms having a vertical opening or recess therein, of lease-rods extending loosely at their ends in said opening or recess, to have a vertical motion therein, substantially as shown and described.

5. In the warp stop-motion of a loom having two sets of drop bars or wires, and a lease-rod outside each set, to divide the warp-threads into two planes, and warp-supporting rods or rests between the lease-rods to support the warp-threads on each side of the drop bars or wires, the combination with brackets or arms having a vertical opening or recess therein, of lease-rods extending loosely at their ends in said opening or recess, to have a vertical motion therein, substantially as shown and described.

697,254. CAROUSEL. WILLIAM JOHNSON, Brooklyn, N. Y. Filed Nov. 21, 1900. Serial No. 57,961. (No model.)

Claim.—1. In a carousel, in combination, a revolvable platform having a radial opening; a shield-supporting slide carried by and movable radially along the platform at the opening therein, the said shield projecting upwardly from said slide and being capable of movement universally in radial planes with respect thereto; a rotatable part situated above the platform; a carrier-rod depending from said part, the said part being adapted when rotated to impart a rocking reciprocating movement to said rod and said shield having a telescopic engagement with said shield; and means for rotating said part, substantially as herein specified.

2. In a carousel, in combination, a revolvable platform having a radial opening; a slide carried by and movable radially along the platform at the opening therein; a tubular shield mounted on said slide and movable universally in radial planes with respect thereto, the said shield being provided with a bushing at one end; a carrier-rod extending longitudinally through said shield and telescopically engaging said bushing; and means for imparting a rocking reciprocating movement to said carrier-rod.

3. In a carousel, in combination, a revolvable platform having a radial opening; a slide carried by and movable radially along the platform at the opening therein; a tubular shield having an extension provided with a plurality of bearing parts; a socket comprising a primary member and a secondary member, and each of said members having a suitable bearing-surface for engagement by said bearing parts; means for adjustably securing said socket members in position for service and in a manner that said shield may be moved in variable planes with respect thereto, the said socket as a whole being firmly mounted on said slide; a carrier-rod extending telescopically through said shield; and means for imparting a rocking reciprocating movement to said carrier-rod.

4. In a carousel, in combination, a revolvable platform having a radial opening; a slide carried by and movable radially along the platform at the opening therein; a socket firmly mounted on said slide; a tubular shield engaging said socket and capable of movement in variable planes with respect thereto; a carrier-rod extending telescopically through said shield; and means for imparting a rocking reciprocating movement universally to said carrier-rod.

5. In a carousel, in combination, a revolvable platform having a radial opening; a slide carried by and movable radially along the platform at the opening therein; a socket firmly mounted on said slide; a tubular shield engaging said socket and capable of movement in variable planes with respect thereto; a carrier-rod extending telescopically through said shield; and means for imparting a rocking reciprocating movement to said carrier-rod.

6. In a carousel, in combination, a revolvable platform having a radial opening; a slide carried by and movable radially along the platform at the opening therein; a socket firmly mounted on said slide, the said socket comprising a primary member and a secondary member, each having a suitable bearing-surface and the former having adjusting-lugs; a tubular shield having bearing parts adapted to engage the bearing-surfaces of said socket members, in service; means for securing said socket members in position for service at the bearing parts of said shield, and in a manner that the latter may be moved in variable planes with respect to said socket; a carrier-rod extending telescopically through said shield; and means for imparting a rocking reciprocating movement to said carrier-rod.

7. An apparatus of the class herein described comprising a revolvable platform having a suitable opening; a slide carried by said platform at the opening therein; a tubular shield having a bushing let into one end thereof; elastic guides mounted within said shield away from said bushing; a carrier-rod extending longitudinally through said shield, and movably engaging said guides and said bushing; and a socket whereby said shield

may be secured in position for service, the said shield having a universal connection with said socket, substantially as herein set forth.

8. In a carousel, in combination, a revolvable platform having a radial opening; a slide carried by and movable radially along the platform at the opening therein; a tubular shield mounted on said slide and movable in variable planes with respect thereto, the said shield being provided interiorly with a guide or guides suitably removed from the confined end thereof; a carrier-rod extending telescopically through said shield and having a sliding engagement with said guide or guides; and means for imparting a rocking reciprocating movement to said carrier-rod, substantially as herein specified.

9. In a carousel, in combination, a revolvable platform having a radial opening; a slide carried by and movable radially along the platform at the opening therein; a tubular shield loosely connected at its lower end to said slide, projecting upwardly therefrom, and movable universally in radial planes with respect thereto; a carrier-rod telescopically engaging said shield; and means for imparting movement to said carrier-rod, all substantially as herein described and for the purposes set forth.

697,255. CENTRIFUGAL MACHINE. ALVIN KAMINSOWSKI, Kallish, Russia. Filed Oct. 26, 1901. Serial No. 73,860. (No model.)

Claim.—1. In combination with a centrifugal drum for treating sugar-leaves, a set of tangentially-arranged holder-slaves for the leaves and means for rotating the same around their own axes when the drum is rotated in the manner and for the purpose substantially as described.

2. In a centrifugal machine for treating sugar-leaves, the combination with a drum of a series of superposed holders for the ends of the leaves and means for rotating the same when the drum is rotated, the said holders being mounted to support the leaves in a direction tangential to a circle concentric with the drum-axis in the manner and for the purpose substantially as described.

3. In a centrifugal machine for treating sugar, the combination with a drum of a series of tangentially-arranged sugar-leaf-holding slaves 8, a centrally-disposed stationary worm in the drum, a series of worm-wheels engaging said worm, said wheels having bearings adapted to rotate with the drum, and ball-bearings in the drum-wall to support the outer end of the leaves in the manner and for the purpose substantially as described.

697,256. MATRIX FOR MAKING RECORDS FOR GRAMOPHONES, SONOPHONES, OR SIMILAR RECORDS. HERBERT KAPLAN, Newark, N. J. Filed Nov. 1, 1901. Serial No. 69,761. (No model.)

Claim.—1. A matrix for making records for gramophones, sonophones, &c., having at its center a bushing of more resisting material than the body of the matrix.

2. A matrix of the character described, having at its center a disk of material harder than the body of the matrix, said matrix having a central perforation through said disk.

3. A matrix of the character described, comprising a disc-like body portion with a central bushing in the plane of said body and being of harder material.

4. A matrix for making records for gramophones, sonophones, &c.,

comprising a flange 10, of copper or the like, a backing 11, of lead or similar material, a bushing 12, of iron or steel at the center of the matrix and in the plane of the backing 11, said matrix being perforated through said bushing.

5. A matrix for making records for gramophones, phonographs, &c., comprising a flange 10, of copper or the like, a backing 11, of lead or similar material, and a bushing of material harder than the backing inserted into said backing, the matrix being perforated through said bushing.

6. A matrix for making records for gramophones, phonographs, &c., comprising a copper face 10, a disk 12, applied to the back thereof, and a backing of lead or the like around said disk, said disk being more resistant material than the backing, and the matrix being perforated through said disk.

7. The herein-described matrix, having a flange 10, a bushing 12 centrally disposed at the back of said flange, and a backing 11, around said bushing, said bushing being of more resistant material than the backing and held in place thereby.

8. The herein-described matrix, having a flange 10, a center bushing 12, and a backing 11, around said bushing, said bushing being of harder material than the backing and being adapted at its peripheral edges to be overlapped by said backing and held in place.

9. The herein-described matrix having a flange 10, a center bushing 12, and a backing 11, around said bushing, said bushing being of harder material than said backing and being shaped in plan to be held against rotation by said backing.

10. A matrix for making records for gramophones, phonographs, &c., having a central bushing of material harder than the body of the matrix, said bushing being embedded in said body of the matrix and held thereby.

11. A matrix for making records for gramophones, phonographs, &c., having a central bushing of material harder than the body of the matrix, said bushing engaging at its edges with the said body of the matrix to prevent displacement.

697,957. READING-STAND. JOHN KRIWANEK, San Francisco, Cal. Filed July 17, 1901. Serial No. 64,425. (No model.)

Claim.—1. The combination in a book-support of a vertical standard, a sleeve slidable thereon, a second sleeve slidable and turnable upon the first, a bracket, means for fixing it upon the second sleeve, a pivoted adjustable arm projecting from the bracket; a book-holder having a sleeve at the bottom adapted to fit the adjustable arm and flexible connection between the upper part of the sleeve and the upper part of the book-holder.

2. A book-supporting frame, a tubular sleeve extending horizontally across the base of the same, a rod upon which the sleeve is slidable, means for holding the sleeve in its adjusted position, a vertical support, adjustable connection between the support and the rod, and adjustable connection between said support and the upper portion of the book-supporting frame.

3. A book-support consisting of a book rack or holder, a vertical adjustable standard, a sleeve turnable and adjustable thereon, having a bracket and an adjustable support at the lower end, and flexible connection with the rack at the top.

4. The combination with a stand and supporting means, of a rack consisting of bars pivoted and flexible, said rack having a tubular sleeve along its lower edge adapted to fit the support from the stand, and means for adjusting the angle of the rack with relation to the stand.

5. The combination of a standard, a sleeve adjustable and turnable thereon, a book-rack having a sleeve extending along its lower edge, means connecting the last-named sleeve with the lower portion of the first-named sleeve, and means connecting the upper portion of the rack with the upper portion of said first-named sleeve.

6. A rack consisting of a lower bar having ledges for the lower edge of the book, side bars pivoted to the ends of said bottom bar, a top bar consisting of two flexible and adjustable bars connected together, having their upper ends pivoted to the tops of the side bars, a diagonal two-part brace-bar and vertical adjustable intermediate bars pivoted thereon, and having their ends forked and adapted to engage the top and lower bars of the rack.

7. A book-rack consisting of a bottom bar with ledges upon opposite sides adapted to support the bottom of a book, side bars pivoted to the ends of the bottom bar, a top bar made in two parts flexible and slidable upon each other, having their top ends pivoted to the tops of the side bars, a diagonal brace-bar pivoted at opposite angles of the frame, intermediate bars pivoted to said diagonal bar and foldable thereon, said bars having forked ends adapted to engage the top and bottom bars of the stand, short supplemental arms having flaps at the outer ends to engage and hold the book-leaves, slides movable upon the intermediate bars to which slides said arms are hinged, so as to be folded and unfolded, and adjustable up and down on the bars.

8. The combination in a book rack and support, of a vertically-adjustable standard, a tubular sleeve turnable and adjustable thereon, a foldable and reversible rack having a tubular bottom sleeve, a bracket carried by the standard with a pivoted rod and means for adjusting its angle, said rod fitting the sleeve of the rack which is supported and adjustable thereon.

697,958. DAMPER. ROBERT O. LATHAM, Manchester, N. H. Filed Oct. 2, 1900. Serial No. 22,480. (No model.)

Claim.—1. In a stove or furnace funnel, a radial standard secured interiorly and extending to a point near the radial center of said funnel, a damper having a radial opening adapted to straddle said standard and pivotally connected to the latter a crank and flexible connection for the same to said damper and within said funnel, and means for operating said crank and damper upon the outside of said funnel.

2. A damper having a central perforation and a radial opening connecting said perforation with its periphery, one located one at each side of said perforation, a vertical standard or support secured and extending to a point near the radial center of and within a smoke pipe or funnel and pivotally connected to the one of said damper, a bar having a crank interior and exterior of said funnel, and a suitable flexible connection between the interior crank and the said damper.

3. In a stove or furnace funnel, a radial standard secured interiorly of and extending to a point near the radial center of said funnel, a damper pivotally connected to said standard, a crank within said funnel, a crank-bar therefor pivoted to the standard and to the funnel, flexible connection between the crank and the damper adapted to operate the latter, and means for operating the crank upon the outside of the funnel.

4. In a smoke-funnel, a damper provided with a radial opening terminating at its center and lateral counter-arms located one at each side of said opening, a vertical standard secured at one end to said funnel and provided with threaded perforations at opposite sides of its free end, curves threaded to the perforations in said standard and having cone-points adapted to bear in the counter-arms of said damper, and a vertical bar having bearings in said funnel and standard and provided with a crank between its bearings and a crank outside of said funnel, and a chain connecting the inner crank with said damper.

5. In a stove or furnace funnel, a radial standard secured interiorly of said funnel, a damper centrally pivoted to said standard, a crank within said funnel, a crank-bar therefor, having its bearings in said

lateral arm of the standard and in the funnel, flexible connection between the crank and the damper adapted to operate the latter, and means for operating the crank upon the outside of the funnel.

697,959. FENCE. BRAS LARLEY, Bucyrus, Ohio, assignor to Sarah Jane Larley, Bucyrus, Ohio. Filed Oct. 21, 1901. Serial No. 79,412. (No model.)

Claim.—1. A fence-post formed in a single strip of metal and bent at an angle to form a base adapted to bear upon the ground, a downwardly-bent stem to the base adapted to be embedded in the ground, and a laterally-bent arm at the upper end of the post, and a wire-support, a spring-coil at one end adapted to engage the post, and means for securing the support to the arm of the post.

2. The combination with a post having a lateral arm at one end and thereof, of a wire-support, a loop thereto adapted to engage the post at a point intermediate its ends, and means for securing the support to the arm of the post.

3. The combination with a post having a lateral arm at one end; of a wire-support, a spring-coil at one end adapted to engage the post, and means for securing the support to the arm of the post.

4. The combination with a post having a lateral arm at one end and thereof, and a web secured to said post and its arm; of a wire-support, a coil at one end thereof adapted to engage the web and the post, means for securing the support to the arm, and an eye at the free end of the support.

697,960. TRACTION-ENGINE DRIVING-WHEEL. EARL R. LEE, Earl, Iowa. Filed Jan. 21, 1902. Serial No. 92,964. (No model.)

Claim.—1. A drive-wheel for a traction-engine having on its hub a rotary adjustable sleeve with two flanges *d d* near the middle thereof, call-bars made in a single piece hinged at their lower ends between the two flanges of the sleeve and having their outer ends divided into two branches, and a rim or tire having holes through which the forked branches protrude.

2. A drive-wheel for a traction-engine comprising a hub with flanges on its ends, a rotary adjustable sleeve on the hub between said flanges, call-bars joined to the sleeve and extending through the rim of the wheel, a crank-arm rigidly fixed to the said sleeve, a link attached thereto, a rock-shaft with cranked portion attached to said link, and separate clips bolted to the flanges of the hub and having journal-bearings for the rock-shaft, and means for adjusting said rock-shaft substantially as described.

3. A drive-wheel for a traction-engine, comprising a hub with end

flanges, a rotary adjustable sleeve arranged on said hub between its end flanges and carrying at each end a rigidly-attached crank-arm, call-bars joined to the sleeve and extending through the rim of the wheel, links connected to the crank-arms of the sleeve, a rock-shaft journaled in bearings on the hub parallel to the same and having a middle cranked portion extended inwardly between the hub-flanges and connected to the two links, and means for adjusting the rock-shaft substantially as described.

4. A drive-wheel for a traction-engine, comprising a hub with end flanges of greater diameter than the middle part, a rotary adjustable sleeve arranged on the hub between the end flanges and having at each end a rigidly-attached crank-arm *F* and in the middle the two flanges *d d*, call-bars made in a single piece hinged between the flanges *d d* at their inner ends and made forked at their outer ends and extending through holes in the rim, links *G G* connected to the cranks of the sleeve, a rock-shaft having a cranked portion *A* extended inwardly between the hub-flanges and connected to the two links, and detachable bearing-clips fastened to the external faces of the hub-flanges and carrying the rock-shaft substantially as described.

697,961. APPARATUS FOR CANNING FOOD. GEORGE LEE, Chicago, Ill., assignor to himself, and Charles O. Harvey, Bridgeport, N. Y. Filed Aug. 17, 1901. Serial No. 73,322. (No model.)

Claim.—1. In an apparatus for canning food, the combination with the cylinder, a removable top or cover and means for connecting the same together, of a cover-plate within the cylinder and adapted to rest upon the covers of the uppermost series of cans, an interiorly-threaded sleeve and a stuffing-box in line with each other and forming parts of the removable cover, a stem passing through the stuffing-box and having a threaded portion passing through the sleeve, a pressure-plate and a flexible joint for connecting the same to the lower end of the said stem and a hand-wheel secured to the upper end of the stem above the cover, substantially as set forth.

2. In an apparatus for canning food, the combination with a cylinder, a removable top or cover and means for connecting the same together, of a cover-plate within the cylinder and adapted to rest upon the covers of the uppermost series of cans, an interiorly-threaded sleeve and a stuffing-box in line with each other and forming parts of the removable cover, a stem passing through the stuffing-box and having a threaded portion passing through the sleeve, a pressure-plate and a flexible joint for connecting the same to the lower end of the said stem and a hand-wheel secured to the upper end of the stem above the cover and a hook 10 and flexible joint connecting the same to the upper end of the stem above the hand-wheel, and a supported differential pulley device adapted to engage the hook for elevating and suspending the cover of the apparatus, and the parts connected therewith, substantially as set forth.

697,962. METHOD OF TRUING UP THE DRAWING-ROLLS OF SPINNING OR TWISTING MACHINES. FRANK H. MARY, Worcester, Mass. Filed Aug. 21, 1901. Serial No. 73,704. (No model.)

Claim.—1. The method of truing up an old and worn drawing-roll, said roll consisting of a core having coverings of soft material, which consists in rotating the roll and applying pressure thereto, to render said roll

uniform in diameter by a compression of the materials with which said roll is covered.

2. The method of truing up an old and worn drawing-roll, said roll consisting of a core having coverings of soft material, which consists in rotating the roll and progressively applying pressure at different longitudinal points on said roll, so as to render the roll uniform in diameter by a compression of the materials with which the roll is covered.

3. The method of truing up an old and worn drawing-roll, said roll consisting of a tube having coverings of soft material, which consists in mounting the roll upon a rotating arbor and rendering the same uniform in diameter by a compression of the materials with which the roll is covered, applied by squeezing the roll in a clamp while the roll is being rotated.

4. The method of truing up an old and worn drawing-roll of a spinning or twisting machine, said roll consisting of a shell covered with a layer of felt and a facing of leather, which consists in mounting the same upon a rotating arbor, and then rendering the same uniform in diameter by a compression of the materials with which the roll is covered, so as to secure the shifting and repositioning of the fibers of the inner felt layer of the roll, said compression being applied by squeezing the roll in a clamp while the same is being rotated, and shifting the clamp to different longitudinal points along the roll.

697,268. HEAD OF PILE-WIRE FOR LOOMS. EMORY L. HART, York, N. Y. Filed Jan. 23, 1902. Serial No. 93,969. (No model.)

Claim.—1. In a pile-wire for looms, a head having a slot therein, a recess at the end of said slot, cut-away portions upon each side of the head adjacent to the slot, a wire having a bent end engaging the slot and recess, a semicircular plate bent centrally upon itself adapted to fit snugly over the said wire, apertures in the plate registering with apertures in the head and wire, rivets secured in the said apertures, flanges upon the plate adapted to be bent so as to form a collar around the wire, substantially as shown and described.

2. In a pile-wire for looms, a head having a slot therein, a recess at the end of said slot, cut-away portions upon each side of the head, a wire having a bent end, the said wire engaging the said slot and recess, a semicircular plate folded upon itself, the said plate adapted to fit snugly over the wire, flanges upon the said plate adapted to form a collar around the wire, and rivets passing through the said plate, wire and head, substantially as shown and for the purpose set forth.

697,264. LOCK WATER-CLOSET SEAT. WILLIAM C. MILLER, Jersey City, N. J. Filed July 26, 1902. Serial No. 34,961. (No model.)

Claim.—1. A combination-cover consisting of a water-closet ring seat, and a small cover hinged to it and adapted to close the opening in it, so that both in position connected together form and constitute a closure to the underlying toilet-seat for the purpose set forth.

2. The combination of a water-closet ring seat, and a small cover hinged to it, a block or like device on under side of small cover adapted to enter and close the opening in it, the parts in position connected together forming and constituting a closure to an underlying toilet-seat for the purpose set forth.

3. The combination of a water-closet ring seat and a small cover hinged to it adapted to close the opening in it, and a latch to connect the small cover with the ring seat, the parts thus compactly joined forming and constituting a closure for an underlying toilet-seat for the purpose set forth.

4. The combination of a water-closet ring seat and a small cover hinged to it adapted to close the opening in it, and a catch to connect the cover with the ring seat, the parts thus compactly joined forming and constituting a closure to an underlying toilet-seat for the purpose set forth.

5. The combination of a water-closet ring seat and a small cover with a block on under side of it adapted to enter and close the opening in ring seat, the parts in their relative position connected together forming and constituting a closure to an underlying toilet-seat; and locking device to compactly join the parts of the combination together for the purpose set forth.

697,265. LATHE ATTACHMENT. JOHN R. MILLER, Chicago, Ill. Filed June 17, 1901. Serial No. 94,790. (No model.)

Claim.—1. In a lathe, the combination with a chuck and a tool-carriage, of a cam mounted on said chuck, a pivotally-movable tool-head transversely adjustable mounted on the tool-carriage, and device on said tool-head engaging said cam to impart reciprocal movement to the cutting-tool, substantially as described.

2. In a lathe, the combination with the chuck and the tool-carriage, of a tool-holder mounted on the tool-carriage, said tool-holder comprising two heads pivotally and relatively movable, means for adjusting same in relative position, and device for imparting pivotal movement to said heads comprising a drum-cam mounted on the chuck, a rack-bar passing through one of said heads and movable relatively thereto, and relatively adjustable arms at one end of said rack-bar engaging opposite peripheral faces of said cam.

697,266. DESK. WILLIAM J. McDEVITT, Philadelphia, Pa. Filed May 11, 1900. Renewed Oct. 11, 1901. Serial No. 73,962. (No model.)

Claim.—1. A desk of the character described, comprising a body and a hinged cover or lid therefor, movable supports adjacent said lid and body, and adapted to sustain the lid when in its lowermost position, movable compartments arranged within the body of the desk, and arms connected to the lid, links pivoted to the arms and attached to the compartments for automatically and simultaneously moving said supports and compartments with the opening and closing of the desk.

2. A desk of the character described, comprising a body provided with guideways, said body having movable compartments therein, adapted to hold an ink-well, pen-riper, pen-rest, and stationary, a hinged lid

or cover for said body, movable supports adapted to move in guideways formed in the body of the desk, and to support said lid or cover when in its lowermost position, and arms connected to the lid, links pivoted to the arms and attached to the compartments and to the supports whereby said supports and compartments are automatically moved with the opening and closing of the desk.

3. A desk of the character described, comprising a body having movable compartments therein, a hinged cover for said body, said cover being provided with grooves, arms adapted to said grooves and pivoted to said cover, links connected to said arms and pivoted to the base of said compartments, movable supports adapted to sustain said cover when in its lowermost position, and rods connected to the compartments and to the supports to move therewith, substantially as described.

697,267. AUTOMATIC ELECTRIC CONTROLLER. ALEXANDER MCGARY and FRANK WEAVER, Lagrange, Ill. Filed May 25, 1901. Serial No. 51,222. (No model.)

Claim.—1. In an automatic electric controller, the combination of a dynamo adapted to be driven from an axle, a dynamo-circuit, a storage battery and lamp-circuit, of a variable resistance arranged for introduction into the dynamo-circuit, a traveling bar whereby said resistance may be varied, constantly-actuated means for moving said bar, a solenoid having a core, a spring pressing on said core, connections between the core and constantly-actuated means, a lever against which said spring bears, and means between the lever and the traveling bar for moving the latter to compress the spring when the core of the solenoid is moved.

2. In an automatic electric controller, the combination of a dynamo adapted to be driven from an axle, a dynamo-circuit, a storage battery and lamp-circuit, of a variable resistance arranged for introduction into the dynamo-circuit, a traveling bar whereby said resistance may be varied, constantly-actuated means for moving said bar, a solenoid having a core, a lever operatively connected to said traveling bar, a spring interposed between the lever and core and means to cause the lever to compress the spring when the current through the dynamo-circuit is increased.

3. In an automatic electric controller, the combination of a dynamo and its circuit, a storage battery and lamp-circuit, a resistance adapted to be introduced into the dynamo-circuit, a traveling bar whereby the resistance may be varied, constantly-actuated means for moving said bar, a solenoid having a core operatively connected to control said constantly-actuated means, a lever, a yielding connection between said lever and core, a link interposed between said lever and traveling bar, and means operative upon movement of said bar to move said link and compress the yielding connection between the lever and core.

4. In an automatic electric controller, the combination of a dynamo and its circuit, a storage battery and lamp-circuit, a resistance adapted to be introduced into the dynamo-circuit, a traveling bar having a slot with an inclined or cam portion whereby the resistance may be varied, con-

stantly-actuated means for moving said bar, a solenoid having a core operatively connected to control said constantly-actuated means, a lever, a yielding connection between said lever and core, a link interposed between said lever and traveling bar, and having one end engaged by the slot in said bar to move the link and compress the yielding connection between the lever and core.

5. In a system for lighting cars comprising an axle-driven dynamo, storage battery and incandescent lamps, the combination of a rheostat to control the current passing to the storage battery, of a second rheostat to control the current passing from the storage battery to the lamps, and automatic means for controlling said rheostats consisting of a solenoid located in the circuit between the dynamo and battery, a spring-pressed armature, an oscillating lever and means for constantly actuating it, said lever carrying at one end two oppositely-directed pawls, means for connecting said pawls to the armature of the solenoid, a rack-bar adapted to be moved in one direction by one of said pawls and in the opposite direction by the other and being provided at one end with a contact-strip of the first rheostat and with means at the other end to actuate the contact-strip of the second rheostat.

6. In a system for lighting cars comprising an axle-driven dynamo, storage battery and incandescent lamps, the combination of a rheostat in the circuit between the dynamo and battery, a second rheostat in the circuit between the battery and lamps, means controlled by the current passing from the dynamo for regulating or controlling said rheostats, comprising a solenoid having a spring-pressed armature, a reciprocating rack-bar, means for actuating said bar controlled by said solenoid, said rack-bar being provided within the contact-strip of the first rheostat and a cam-disk at the other end, a reciprocating link M having a projection at one end to enter the cam-disk, a pivot-trump carrying the contact-strip of the second rheostat adapted to be actuated by link M, and a lever L connected at one end to the link M and adapted to engage the spring of the solenoid-armature at its other end.

697,268. SAVINGS-BANK. FRANK C. McFERRIN, Danversville, Pa. assignor to John W. Hoffman, Mont D. Youtan, and J. Foster Bell, Rochester, Pa. Filed Nov. 19, 1901. Serial No. 95,653. (No model.)

Claim.—1. In a savings-bank, a box or receptacle partially cut away in the top or cover, a false bottom secured in the box a slight distance below top or cover, a coin-delivery plate arranged to slide longitudinally of the box within the space between the false bottom and the top or cover, said plate having a coin-receiving opening and provided in one end with a slot communicating with the opening, a gate pivotally mounted in the box or receptacle, and a spring for normally holding said gate in front of the space between the cover and the false bottom, substantially as described.

2. In a savings-bank, a box having a cut-away portion in the top thereof, a false bottom located within the box a slight distance below the top, a spring-held gate pivotally mounted in the box and lying normally in front of the space between the top and false bottom, and a coin-delivery plate adapted to slide on the false bottom, said plate having a coin-receiving opening and provided in one end with a slot which receives the gate when the box is tilted, as and for the purpose described.

3. In a savings-bank, a box or receptacle having a portion of its top or cover cut away, a false bottom within the box or casing, and a spring-held gate which is normally held in front of the space between the top or cover and the false bottom, combined with a slidable coin-delivery plate supported by the false bottom and having a coin-receiving opening and provided with a slot adapted to receive the gate when the box or receptacle is tilted whereby the gate is engaged by the coin and operated to permit the discharge of the coin into the box or receptacle, substantially as described.

697,269. ENVELOPING-MACHINE. DAVID HADEN, Berlin, Germany. Filed Dec. 26, 1900. Serial No. 730,749. (No model.)

Claim.—1. An enveloping-machine comprising in combination stitch-forming mechanism, feeding mechanism and controlling mechanism therefor comprising a crank and means for operating the crank compari-

ing a pattern-drum having complementary cam-paths, and independent elements operatively connecting said cam-paths and crank.

2. An overlocking-machine comprising in combination stitch-forming mechanism, feeding mechanism, and means for controlling the feeding mechanism comprising a crank, a pattern-drum having complementary cam-paths, elements connecting the crank and the cam-paths and so disposed that the leverage of one is at its maximum while the other is at its minimum.

3. An overlocking-machine comprising in combination stitch-forming mechanism, feeding mechanism, and means for controlling the feeding mechanism including a shaft, a crank having arms arranged at an angle to each other and carried by the shaft, a pattern-drum having complementary cam-paths, and a pair of rods, each connecting a cam-path with the corresponding arm of the crank, the connections being so disposed that the effective working angle is greater than the actual angle of the arms.

4. An overlocking-machine comprising in combination stitch-forming mechanism, feeding mechanism, and means for controlling the feeding mechanism comprising a shaft, a crank having arms arranged at an angle to each other and carried by the shaft, a pattern-drum having two complementary cam-paths, and a pair of rods, each connecting a cam-path with the corresponding arm of the crank, the connections being so disposed that the effective working angle is greater than the actual angle of the arms.

5. An overlocking-machine comprising in combination stitch-forming mechanism, feeding mechanism, and means for controlling the feeding mechanism, comprising a shaft, a crank having arms arranged at an angle to each other and carried by the shaft, a pattern-drum having complementary cam-paths, connecting-rods, each attached to an arm of the crank and operated by the cam-paths, and means for holding the rods in position in the cam-paths, substantially as described.

697,270. PATTERN MECHANISM FOR SEWING-MACHINE. CHINER, DAVID HAME, Berlin, Germany. Filed Jan. 2, 1902. Serial No. 106. (No model.)

Claim.—1. In an overlocking-machine, the combination of a universal feed mechanism, a crank mechanism for controlling the direction of the feed, and pattern mechanism operating on said crank mechanism, comprising a pattern-former rotated in suitable manner, provided with two sets of gearing means, intermediate reversing-gear operated by said sets of gearing on the pattern-former, and gearing driven by said reversing-gear and transmitting its motion to the crank, whereby an automatic reversal of the direction of rotation of said crank is effected at desired intervals, all substantially as and for the purpose set forth.

2. In an overlocking-machine, the combination of a universal feed mechanism, a crank mechanism for controlling the direction of the feed, and pattern mechanism operating on said crank mechanism, comprising a pattern-former rotated by suitable gearing from the main shaft of the machine, and provided with two lateral sets of teeth, toothed gears each

operated by only one set of the teeth, and gearing actuating the crank and mounted intermediately of said toothed gears and meshing with both, so as to be rotated alternately in opposite directions, according as one or other set of pattern-former teeth come into operation, substantially as and for the purpose set forth.

697,271. FRICTION-CLUTCH. ALLEN R. BERNER, Cambridgeport, Mass. Filed Oct. 14, 1901. Serial No. 73,788. (No model.)

Claim.—1. A friction member comprising a wheel having a flat face, a circularly-arranged series of radially-movable friction-blocks applied thereon, said blocks having outer and inner inclined friction-faces, the adjacent ends of said blocks being inclined toward each other, wedge-shaped holding members arranged between adjacent blocks, with means to clamp said holding members to said wheel.

2. A friction member comprising a wheel having a flat face, a circularly-arranged series of radially-movable friction-blocks applied thereon, said blocks having outer and inner inclined friction-faces, the adjacent ends of said blocks being inclined toward each other, wedge-shaped holding members arranged between adjacent blocks, with means to clamp said holding members to said wheel, the wedge-faces of said holding members and adjacent ends of said blocks standing respectively at an angle of ninety degrees from each other whereby is obtained the highest clamping efficiency without appreciable tendency to separate said blocks.

3. A friction member comprising a wheel having a flat face, a circularly-arranged series of friction-blocks applied to said flat face and having outer and inner inclined friction-faces, the adjacent ends of said blocks being notched and inclined toward each other, wedge-shaped holding members arranged between adjacent blocks and clamping devices passing through the recesses formed by the adjacent notched ends of said blocks to clamp said holding members to said wheel.

4. A friction member comprising a wheel having a flat face, a circularly-arranged series of friction-blocks applied to one of the faces of said wheel and having outer and inner inclined friction-faces, said blocks having the capacity to move radially on said wheel, and means to secure said blocks to said wheel while permitting said radial movement.

5. A friction member comprising a wheel having a flat face, a circularly-arranged series of friction-blocks applied to said face and having outer and inner inclined friction-faces, said blocks having wedge-shaped ends, wedge-shaped holding members arranged between said blocks, and clamping-bolts for said holding members extended inward through openings in said wheel-face, said openings being larger in diameter than said bolts to permit the radial movement of the latter as said blocks go and come.

6. A friction member comprising a wheel, a circularly-arranged series of friction-blocks applied to one of the faces of said wheel, each block having an outer and an inner inclined friction-face and each block being arranged with its grain radial, that is, exposed at its outer and inner friction-faces, said blocks being free to move radially on said wheel, and means to clamp said blocks upon said wheel while preserving the capacity of said blocks to move radially.

697,272. METHOD OF BLANCHING FRUIT. AL. CLARKE H. FLEMING, Wash. D. C. Filed July 22, 1905. Serial No. 24,598. (No specimens.)

Claim.—1. The method of blanching peas or other vegetables, which consists, first, in using heated water successively in a series of compartments to soften the vegetables and facilitate the separation of the deleterious portions; and, second, causing the vegetables to move through the several compartments from the last water-receiving compartment toward that in which the water is first admitted.

2. The method of blanching peas and other vegetables, which consists, first, in using heated water successively in a series of compartments

to soften the vegetables and facilitate the separation of the deleterious portions; second, causing the vegetables to move through the several compartments in a direction opposite to that taken by the water; and, third, causing the vegetables to travel back and forth in the water of each compartment at an angle to their general line of travel.

3. The method of blanching peas and other vegetables, which consists, first, in using heated water successively in a series of compartments to soften the vegetables and facilitate the separation of the deleterious portions; second, causing the vegetables to move through the several compartments in a direction opposite to that taken by the water; and third, conveying the vegetables freely along in the water of each compartment by means of a supporting element, acting upon them at an angle to their general line of advance.

4. The method of blanching peas and other vegetables, which consists, first, in using heated water successively in a series of compartments to soften the vegetables and facilitate the separation of the deleterious portions; second, conveying the vegetables freely along in the water by means of a supporting element acting to lift them at an angle to the general line of advance, but permitting them to roll freely by gravitation in the opposite direction and toward the point of discharge.

5. The method of blanching peas and other vegetables which consists in using heated water to soften them and facilitate the separation of impurities; and, second, causing them to roll in each water upon a supporting element, acting to continuously lift them and permit their free descent by gravitation whereby the impurities are removed by the separate action of the heated and softened vegetables in the water and upon the contacting surfaces of the supporting element.

6. The method of blanching peas and other vegetables which consists, first, in using heated water successively in a series of compartments to soften the vegetables and facilitate the separation of the deleterious portions; and, second, rolling the vegetables through the water of the several compartments in a direction opposite to that taken by the water in passing through said series.

697,273. AUTOMATIC SAFETY-SWITCH FOR ELECTRIC CIRCUITS. OLIVER I. FLEMING, Chicago, Ill., assignor of one-half to John W. Ware, trustee. Filed Jan. 10, 1901. Serial No. 46,897. (No model.)

Claim.—1. As an article of manufacture, an automatic switch mechanism for branch electric circuits comprising a pair of terminals, a switch-arm oscillating between the terminals, a spring for oscillating the arm, and an electromagnet and a spring acting in opposition to throw the switch-arm oscillating spring, the electromagnet being incorporated into the circuit to be controlled and being normally weaker than the spring.

2. As an article of manufacture, an automatic switch mechanism for branch electric circuits comprising a pair of terminals, a switch-arm co-

oscillating between the terminals, a spring for oscillating the switch-arm, a lever to which one end of the spring is attached, and an electromagnet and a spring acting in opposition to move the lever as to throw the switch-arm oscillating spring, the electromagnet being incorporated into the circuit to be controlled.

3. As an article of manufacture, an automatic switch mechanism for branch electric circuits comprising a pair of terminals, a switch oscillating between the terminals, and an electromagnet and a spring acting in opposition to oscillate the switch, the electromagnet being in circuit with the switch and having a terminal for connection with the main wire of the circuit to be controlled.

4. In an electric switch, in combination, a pivoted switch-arm having projections thereon, a lever adapted to play between the projections and engage the same alternately, a spring the free end of which is connected to the lever and adapted to travel past the pivot of the switch-arm to throw the switch-arm, and an electromagnet and a spring acting in opposition to move the lever as to throw the switch-arm oscillating spring, the electromagnet being in circuit with the switch and having a terminal for connection with the main wire of the circuit to be controlled.

5. In an electric switch, in combination, an oscillating switch-arm having studs or shoulders on opposite sides of its pivot, an arm swinging on the same pivot with the switch-arm and between the studs or shoulders, a retractile spring attached at one end to the swinging arm and having fixed anchorage for its outer end back of the pivot, a stem projecting from the switch-lever oppositely from the anchorage of said spring, a V-shaped cam engaging said stem, and a spring of weaker tension than the before-named spring for holding the cam to the stem.

6. In an electric switch, in combination, a pivoted switch-arm, a lever mounted on the pivot of the switch-arm, a spring connected to the lever and adapted to move past the pivot of the arm to throw the same, means for actuating the lever to throw the spring, and a spring-actuated lever adapted to hold the switch-arm when thrown.

7. In an automatic switch mechanism for a divided electric circuit, in combination, an electromagnet and an oscillating switch-arm both in the main circuit, a pair of branch terminals with which the switch-arm alternately engages, a pivoted lever, a retractile spring for oscillating the switch-arm and attached to the lever and having an anchorage beyond its fulcrum, a lever 32, attached to the armature of the electromagnet for imparting initial movement to the lever for throwing the switch-arm oscillating spring, and a spring acting upon the lever 32 in opposition to the electromagnet.

8. In an automatic switch mechanism for a divided electric circuit, in combination, an electromagnet and an oscillating switch-arm both in the main circuit, a pair of branch terminals with which the switch-arm alternately engages, a pivoted lever, a retractile spring for oscillating the switch-arm and attached to the lever and having an anchorage beyond its fulcrum, a lever 32, attached to the armature of the electromagnet for imparting initial movement to the lever for throwing the switch-arm oscillating spring, a spring acting upon the lever 32 in opposition to the electromagnet, and a spring-actuated lever adapted to hold the switch-arm when thrown.

697,274. HARVESTER-REEL. CHARLEY W. FLEMING, Sharps, Tenn. Filed Oct. 14, 1901. Serial No. 73,804. (No model.)

Claim.—1. In a reel, a hub having curved ways, the curves of which are concentric with the axis of said hub, braces extending from the hub,

and fastening devices uniting said parts, fitted in said curved ways, substantially as described.

2. In a reel, a hub having curved slots, the curves of which are concentric with the axis of said hub, braces extending from said hub, and fastening devices uniting said parts extending into said slots, substantially as described.

3. In a reel, a hub having curved slots, braces extending from said hub and bolts passing through the braces and also through the slots, and the hub having ends to receive the inner ends of said braces, substantially as described.

4. In a reel, a hub having curved ways and grooves, braces, the ends of which are fitted in said grooves, and fastening devices uniting the braces and hub and fitted in said curved ways, substantially as described.

5. In a reel, a hub provided with an inclined face having projections arranged in pairs and curved slots intersecting said projections, braces fitted against said face and arranged between said projections, and fastening devices uniting the braces and hub and fitted in said curved ways.

6. In a reel, a hub having an inclined face and provided with radial arms, projections on said face and arms and curved slots in said face intersecting said projections, braces between said projections, and bolts passing through said braces and slots.

697,275. FIRE-POT FOR BLACKSMITHS' HEARTH. DAVID B. EMMET, Sumner, Pa., assignor of one-half to Eugene D. Curwin, Sumner, Pa. Filed Feb. 12, 1901. Serial No. 47,880. (No model.)

Claim.—1. The herein-described fire-pot for blacksmiths' hearths, comprising several pieces of refractory material quadrangular in cross-section, the said pieces being arranged so as to form an inclosure, and the pieces joined by tongues and grooves set in a vertical direction, whereby the pieces are easily separable, removable and replaceable by sliding in a vertical direction, substantially as and for the purpose specified.

2. In combination with a blacksmith's hearth and grate, a fire-pot constructed from pieces of refractory material, said pieces superposed on said grate and having their ends joined so as to form an inclosure, the joining ends interlocked by means of tongues and grooves set in a vertical direction, and the outer exposed sides of said pieces being vertical planes whereby the pieces are easily separable, removable and replaceable by sliding vertically, substantially as specified.

697,276. HOIST. DAVID B. BOULANGER, Canton, Ohio. Filed Nov. 21, 1901. Serial No. 58,100. (No model.)

Claim.—1. In a hoist of the class described, a frame provided with independent rotatable pulleys located side by side, an elevating-chain located over the pulleys, a swiveled head connected to a head, said head having connected thereto a suspending-hook, a lever pivoted to the swiveled head and to the frame, said lever provided with a pivoted arm lo-

cated at its outer end, a link pivoted to the arm, pivoted bars carried by the lever and a key actuated by the pivoted bars adapted to lock the lever in a lowered position, and means for connecting the pulleys, and disconnecting substantially as and for the purpose specified.

2. In a hoist of the class described, a frame provided with a shaft having pulleys mounted loosely thereon, an elevating-chain located over the pulleys, means for connecting and disconnecting the pulleys, a lever pivoted to the frame and to a swiveled head, a key or wedge located upon the lever and means for sliding the key upon the lever, substantially as and for the purpose specified.

3. In a hoist of the class described the combination of a frame having pivoted thereto a lever, pulleys loosely mounted upon a shaft, a grooved collar provided with pins, apertures formed in one of the pulleys adapted to receive the pins of the sliding collar, a yoke to actuate the sliding collar, a swiveled head pivotally connected to the lever, and said lever provided with an arm located at its outer end, a sliding key located upon the lever, and means for operating the key by means of the swinging movement of the arm located at the outer end of the lever, substantially as and for the purpose specified.

4. In a hoist of the class described, a frame pulleys mounted upon a shaft, the shaft carried by the frame one of said pulleys provided with a toothed flange, a lever provided with a downward-extending arm 16 and means for locking the lever in a lowered position and releasing the pulleys one from the other, and an elevating-chain, substantially as and for the purpose specified.

5. In a hoist of the class described the combination of a frame, a lever pivoted thereto, an arm pivoted to the outer end of the lever, a link connected to the pivoted arm, bars pivoted to the lever, a sliding key or wedge provided with a slotted arm, a pin to engage the slot and the key provided with a guide extension, a slot formed in the frame, pulleys mounted upon a shaft carried by the frame, an elevating-chain located over the pulleys, and means for disengaging the pulleys, substantially as and for the purpose specified.

697,277. SIGNALING SYSTEM FOR SINGLE-TRACK RAILWAYS. WILLIAM W. SALMON, Chicago, Ill., assignor to the Bell Signal Company, a Corporation of Maine. Filed July 21, 1904. Serial No. 518,217. (No model.)

Claim.—1. In an electric signaling system for single-track roads, the combination of a series of out-running blocks and a series of overlapping incoming blocks, signals for the blocks, signal-operating devices connecting the incoming signals together and the out-running signals together and interconnecting the incoming and out-running signals, an electromagnetic double switch controlling the out-running signals of its section, a second electromagnetic double switch controlling with the first of said switches the corresponding signal and the out-running of the preceding block, and the incoming signal of the section at which the second-named magnet is located, said incoming signal being located in the rear of its corresponding out-running signal not less than the distance between the said incoming signal and the next incoming signal toward the said out-running signal, substantially as set forth.

2. In an electric block-signaling system the combination of a series of incoming blocks, and a series of out-running blocks, signals for the blocks and signal operating or controlling devices for signals connecting the incoming signals together and the out-running signals together and interconnecting the incoming and out-running signals, an electromagnetic double switch controlling the out-running signals of its section, a second electromagnetic double switch controlling with the first of the said switches the corresponding signal and the out-running signal of the preceding block, and the incoming signal of the section at which the second-named magnet is located, substantially as set forth.

3. In an electric signaling system for single-track roads, the combination of a series of out-running blocks and a series of overlapping incoming blocks, signals for the blocks and operating or controlling devices for

the signals connecting the incoming signals together and the out-running signals together and interconnecting the incoming and out-running signals, each out-running signal guarding a portion of the track which is also guarded by a corresponding incoming signal, said incoming signal being located in the rear of its corresponding out-running signal not less than the distance between the said incoming signal and the next incoming signal toward the said out-running signal, a pair of double electromagnetic switches located at the out-running signal, one of said switches controlling the out-running signals of a block, the other of said switches controlling the corresponding signal, substantially as set forth.

4. In an electric signaling system for single-track roads, the combination of a series of out-running blocks and a series of overlapping incoming blocks, signals for the blocks connecting the incoming signals together and the out-running signals together and interconnecting the incoming and out-running signals, each out-running signal guarding a portion of the track which is also guarded by a corresponding incoming signal, said incoming signal being located in the rear of its corresponding out-running signal not less than the distance between the said incoming signal and the next incoming signal toward the said out-running signal, a magnetic double switch controlling the out-running signal of its section, a second magnetic double switch controlling with the first of the said switches the corresponding signal and the out-running signal of the preceding block, and its corresponding signal, substantially as set forth.

5. In a single-track block-signaling system, two series of signals, each series adapted to act as danger-signals for trains moving in one direction and as opposing signals for trains moving in the other direction, said signals being arranged alternately along the track, first a signal from one series, then a signal from the other and so on, limited sections of track for the signals, a track-circuit for each of said sections of track adapted to be operated by the train while on said section, a double switch-relay in each of said circuits, secondary signaling circuits adapted to operate the signals, circuit-breakers in each of said signaling-circuits adapted to the signal-circuits of one series of said signals to be operated by the relays in three of said track-circuits and in the signaling-circuits of the other series to be operated by the relays in four of said track-circuits, substantially as set forth.

6. In a single-track block-signaling system, two series of signals, each series adapted to act as danger-signals for trains moving in one direction and as opposing signals for trains moving in the other direction, said signals being arranged alternately along the track, first a signal from one series, then a signal from the other and so on, limited sections of track for the signals, a normally closed track-circuit for each of said sections of track adapted to be operated by the train while on said section,

a double switch-relay in each of said circuits, secondary signaling-circuits, normally closed, adapted to operate the signals, circuit-breakers in each of said signaling-circuits, adapted to the signaling-circuits of one series of said signals to be operated by the relays in three of said track-circuits and in the signaling-circuits of the other series to be operated by the relays in four of said track-circuits, substantially as set forth.

7. In a single-track block-signaling system, two series of signals, each series adapted to act as danger-signals for trains moving in one direction and as opposing signals for trains moving in the other direction, limited sections of track, track-circuits including said limited sections adapted to be operated by the train, double switch-relays in said circuits, secondary signaling-circuits adapted to operate the signals, circuit-breakers in each of said signaling-circuits adapted to the signaling-circuits located at the danger-signals of one series of said signals to be operated by the relays of the track-circuits covering the portions of track between a signal of said first series and the opposing signal of the other series which is the second one of said series beyond a preliminary track-section which lies immediately in advance of the said signal of the first series, and adapted in the signaling-circuits of the other series of said signals to be operated by the relays of the track-circuits covering the said preliminary track-sections and the track-sections between it and the second signal of the said other series beyond said preliminary track-section, substantially as set forth.

8. The signal system comprising series of signals, each series constructed to operate as danger-signals when a train is moving in one direction, and as rear signals when the train is moving in the opposite direction, and double switch-relays connecting the individual members of the series and interconnecting the members of the different series, and under the control of a moving train to act successively and maintain a plurality of signals of one series in advance of the train as danger-signals and a signal of another series out to the rear of the train as rear signals, substantially as set forth.

9. The signal system, comprising series of signals arranged in sets, the individual members of a set being electrically interconnected, the one member of a set serving to control the setting of the signal of its companion to danger as a danger-signal when the train is running in one direction, and a double switch-relay and electric circuits under the control of the train to simultaneously operate adjacent sets of signals to set two of the signals of one series in advance of the train as danger-signals and to set two of the signals of another series to the rear of the train as rear signals, substantially as set forth.

10. The signal system, comprising series of signals arranged in sets, the individual members of a set being electrically interconnected, the one member of a set serving to control the setting of the signal of its companion to danger as a danger-signal when the train is running in one direction, circuits for the signal and rail-circuits, double switch-relays in said rail-circuits operating or controlling the signal-circuits, said circuits being organized and arranged to protect the train in front and rear by at least three signals maintained at danger whereby when two signals of one series are held at danger as danger-signals at least one signal of the other series must be held at danger as a rear signal and when two signals of one series are held at danger as rear signals at least one signal of the other series must be held at danger as a danger-signal, substantially as set forth.

697,278. EARTHEN AND FASTERIES HEARTH. ALBERT BULLOCK, JR., New York, N. Y. Filed Feb. 27, 1901. Renewed Dec. 12, 1901. Serial No. 38,448. (No model.)

Claim.—1. An improved device of the class described, comprising a hollow body portion, a clamping member arranged adjacent to an opening formed in said body portion and consisting of relatively movable jaws, and a securing member whereby the device may be connected with a support, said clamping member and said securing member embodying a head and a spring member a portion of which constitutes one jaw of said clamping member.

2. An improved device of the class described, comprising a stamped metal body portion formed to simulate the head of an animal, a clamping member arranged adjacent to the mouth portion of the simulation and consisting of relatively movable spring-mounted jaws provided with teeth, and a securing member whereby the device may be connected with a wall or other support, said securing member and one of said jaws combining

of a single bent strip of spring metal, and the other of said jaws consisting of a single strip of spring metal which is secured to said first-mentioned strip.

3. An improved device of the class described, comprising a stamped-metal body portion formed to simulate the head of an animal, a clamping member arranged adjacent to the mouth portion of the simulation and consisting of relatively movable spring-mounted jaws provided with teeth, and a moving member whereby the device may be connected with a wall or other support, said securing member and one of said jaws consisting of a single bent strip of spring metal which is connected with the body portion and formed at one end into said jaw and at the other end into a hook, and the other of said jaws consisting of a single strip of spring metal which is secured to said first-mentioned strip.

697,279. MATTRESS OR CUSHION AND HEATING ATTACHMENT THEREFOR. *ALFRED E. SUMMERS*, Maryville, Kans., assignor of one-half to David van Rensen, Maryville, Kans. Filed Dec. 2, 1901. Serial No. 81,361. (No model.)

Claim.—1. A mattress or cushion adapted for receiving a heating appliance, the same having top and bottom portions which are connected at one side but otherwise separable, one of them being provided interiorly with projections or ribs, and spaces intervening them for accommodating a heater, substantially as shown and described.

2. An improved mattress or cushion for receiving a heating appliance, the same having separable top and bottom portions and interior ribs or projections surrounded by spaces which intervene them and the side portions of the mattress, substantially as shown and described.

3. The improved mattress or cushion having separable top and bottom portions and provided interiorly with projecting portions extending parallel and spaced apart from each other and from the sides and ends of the mattress whereby the latter is adapted to receive a heating appliance having a form corresponding to the spaces surrounding said projections, substantially as shown and described.

4. The combination with a mattress or cushion having separable top and bottom portions and provided interiorly with projecting portions which are spaced apart, of a heater formed of tubular portions which are adapted to fit in the spaces between the said projections of the mattress, substantially as shown and described.

5. The combination with the mattress or cushion having separable top and bottom portions and interior parallel lengthwise projections or ribs formed on the bottom portion which projections are spaced from each other and from the sides and ends of the mattress, of a heating appliance consisting of a series of parallel tubular and tubular end portions adjoining the same, the heater as a whole being adapted to fit in the spaces provided between the said projections of the mattress and the sides and the ends of the latter, as shown and described.

6. The combination with a flexible mattress having divided top and bottom portions and provided interiorly with ribs or projections which are spaced apart, of a flexible heating appliance composed of a series of longitudinal tubular portions and tubular end portions, the latter having nozzles which are accessible at the ends of the mattress and adapted for application of screw-plugs or circulating-pipes, whereby the mattress and its contained heater are adapted for use in the manner described.

697,280. MACHINE FOR APPLYING BOTTLE-COALS. *HOWARD R. SUMMERS*, Baltimore, Md., assignor, by mesne assignments, to Universal Seal and Stopper Company, Camden, N. J., and Baltimore, Md., a Corporation of New Jersey. Filed Sept. 28, 1895. Serial No. 70,574. (No model.)

Claim.—1. In a machine for applying bottle-coal, the combination with a sealing-head containing a compound plunger, the parts thereof being capable of independent vertical movement, one part being adapted to seal the seal in the inside of the bottle-neck, and the other to engage the locking means of the seal and lock the seal in place therein, substantially as described.

2. In a machine for applying bottle-coal, the combination with a sealing-head containing a compound plunger, the parts thereof being capable of independent vertical movement, one part being adapted to seal

the seal in the inside of the bottle-neck, and the other to engage the locking means of the seal and lock the seal in place therein, of means to operate the plunger to seal and lock the seal, substantially as set forth.

3. In a machine for applying bottle-coal, the combination with a sealing-head containing a compound plunger, the parts thereof being capable of independent vertical movement, one part being adapted to seal the seal in the inside of the bottle-neck and another to engage the locking means of the seal and lock the seal in place therein, and to operate yieldingly upon said seal, of means to operate the plunger to seal and lock the seal, substantially as described.

4. In a machine for applying bottle-coal, the combination with a sealing-head containing a compound plunger, the parts thereof being capable of independent vertical movement, one part being adapted to seal the seal in the inside of the bottle-neck and the other to engage the locking means of the seal to lock the seal in place therein, and to operate yieldingly upon the seal, means for operating the plunger to seal the seal, and means for returning the parts to normal position, substantially as described.

5. In a machine for applying bottle-coal, the combination with a sealing-head formed with a liquid-inlet therein and a chamber to receive the same and a valve communicating with said chamber for the purpose set forth, of a compound plunger in said head, the parts thereof being capable of independent movement, one part being adapted to seal the seal in the inside of the bottle-neck in its downward movement and the other part to lock the seal therein after the stoppage of the first-mentioned part, means for operating the plunger and means for returning all the parts to normal position, substantially as described.

6. In a machine for applying bottle-coal, the combination with a sealing-head formed with a liquid-inlet therein and a chamber to receive the same, and a valve communicating with said chamber for the purpose set forth, of a compound plunger in said head, the parts thereof being capable of independent movement, one part being adapted to seal the seal in the inside of the bottle-neck in its downward movement and the other part to lock the seal therein after the stoppage of the first-mentioned part, means for supporting the bottle below the head and moving the same to seal from said head, means for operating the plunger, and means for returning all the operating parts to normal position after each operation, substantially as described.

7. In a machine for applying bottle-coal, the combination with a sealing-head containing a compound plunger, the parts thereof being capable of independent vertical movement, one adapted to seal the seal in the inside of the bottle-neck in its downward movement, and the other to engage the locking means of the seal to lock said seal in place therein, after the stoppage of the first-mentioned part, a bottle-supporting table below the head, means for raising and lowering the same, and means for returning all the operating parts to normal position after each operation.

8. In a machine for applying bottle-coal, the combination with a sealing-head, a plunger in said head comprising an upper member having a cross-head as 23 thereon, and a two-part lower member mounted to receive the cross-head, the two parts being adapted to operate in the described relation to each other to seal the seal in the inside of the bottle-neck and to lock the same therein, a spring interposed between the two members and keeping the cross-head normally at the top of the recess in the

lower member, and means for operating the plunger to cause both members to descend together in the initial movement of the plunger but to continue the movement of the upper member after the stoppage of the lower member, substantially as described.

9. In a machine for applying bottle-coal the combination with a sealing-head, a plunger in said head comprising an upper member having a cross-head thereon, and a lower member having a chamber to receive the said cross-head, said cross-head being capable of vertical movement in said chamber, a spring interposed between the two members and keeping the cross-head normally at the top of the chamber in the lower member, means for operating the plunger to cause both members to descend together in the initial movement of the plunger but to continue the movement of the upper member after the stoppage of the lower member, a lower head portion formed with a liquid-inlet therein and a chamber to receive the same and a valve communicating with said chamber for the purpose set forth, and means for controlling the admission of liquid to the chamber, substantially as described.

10. In a machine for applying bottle-coal, the combination with a sealing-head containing a compound plunger the parts thereof being capable of independent vertical movement, of means for operating the sealing-plunger to seal the seal in the inside of the bottle-neck upon the initial movement of a part of the plunger, and to cause the locking-plunger to engage the locking means of the seal and lock the seal in place therein by a further downward movement, and means for returning the parts to normal position, substantially as described.

11. In a machine for applying bottle-coal, the combination with a suitable frame, of a sealing-head containing a compound plunger, the parts thereof being capable of independent vertical movement, one part being adapted to seal the seal in the inside of the bottle-neck and another to engage the locking means of the seal and lock the seal in place therein, and to operate yieldingly upon the seal, the movement of the part of the plunger to lock the seal being independent of the movement of the sealing-plunger, and means for returning the operating parts to normal position.

12. In a machine for applying bottle-coal, the combination with a sealing-head containing a compound plunger, the parts thereof being capable of independent movement, means for operating the plunger to seal the seal in the inside of the bottle-neck upon the downward movement of one of the parts and to lock the same in place therein after the stoppage of the first-mentioned part, a bottle-supporting table below the head, and means for raising and lowering the same, a bottle-centering device secured to the table and adjustable toward and from the center thereof, and means for returning all the operating parts to normal position after each operation.

697,281. MACHINE FOR APPLYING BOTTLE-COALS. *HOWARD R. SUMMERS*, Baltimore, Md., assignor, by mesne assignments, to Universal Seal and Stopper Company, Camden, N. J., and Baltimore, Md., a Corporation of New Jersey. Filed Sept. 28, 1895. Serial No. 70,575. (No model.)

Claim.—1. In a bottle-sealing machine, the combination with a sealing-head provided with a spring-pressed plunger having ends adapted to extend into the bottle-neck and adapted to seal the seal therein, of a spring-pressed locking-plunger adapted to engage the locking means of the seal to lock said seal in place after it has been sealed in the bottle, a slidable lower portion adapted to be engaged by the bottle-head to slide said portion to bring the seal-sealing-plunger ends into the mouth of the bottle to seal the seal, and the locking-plunger into engagement with the locking means to lock the seal, substantially as described.

2. In a bottle-sealing device, the combination with a sealing-head provided with a compound plunger, the parts thereof being spring-pressed and capable of independent movement, one member being adapted to seal the seal in the inside of the bottle-neck, and the other to engage the locking means of the seal to lock the seal in place therein after the stoppage of the first-mentioned part, a slidable lower head portion adapted to be engaged by the bottle-head to slide said portion to bring the seal-sealing member into the mouth of the bottle for the purpose set forth, and the locking member into engagement with the locking means of the seal to lock the seal in place, substantially as described.

3. In a machine for applying bottle-coal, the combination with a

sealing-head provided with a compound plunger, the parts thereof being spring-pressed and capable of independent movement, one member being adapted to seal the seal in the inside of the bottle-neck and the other to lock it in place therein, a lower slidable portion adapted to be engaged by the bottle-head to slide it on the upper portion to bring the seal-sealing member into the bottle-mouth to seal the seal, and the locking-plunger into engagement with the locking means of the seal to lock said seal in place, and means for moving the bottle against the lower head portion, substantially as described.

4. In a machine for applying bottle-coal, the combination with a sealing-head provided with a compound plunger the parts thereof being held normally closed by springs or their equivalents, and capable of independent movement, one member being adapted to engage the seal to seal it in the bottle-neck and the other to engage the locking means to lock the seal, a lower slidable portion provided with an undermost centering-surface to be engaged by the bottle to slide the slidable portion to bring the sealing member of the plunger into the bottle-mouth, and the locking member into engagement with the locking means of the seal for the purpose set forth, a vertically-movable bottle-supporting table below the head, and means for raising the same, and means for returning the table to normal position, substantially as described.

697,282. MACHINE FOR APPLYING BOTTLE-COALS. *HOWARD R. SUMMERS*, Baltimore, Md., assignor, by mesne assignments, to Universal Seal and Stopper Company, Baltimore, Md., and Camden, N. J., a Corporation of New Jersey. Filed Dec. 21, 1901. Serial No. 87,000. (No model.)

Claim.—1. A machine for applying bottle-coal, comprising an outside sleeve, a vertically-movable core in said sleeve and containing a compound plunger, the parts thereof being spring-pressed and each member capable of a movement independent of the other in the core, one of said plunger members being adapted to seal the seal in the inside of the bottle-neck, and the other adapted to engage the locking means of the seal to lock said seal in place therein, substantially as described.

2. A machine for applying bottle-coal, comprising an outside stationary sleeve, a vertically-movable core in said sleeve containing a compound plunger, the parts thereof being spring-pressed and each member capable of a movement independent of the other in the core, one of the plunger members being adapted to seal the seal in the inside of the bottle-neck, and the other to engage the locking means of the seal to lock said seal in place in the bottle-neck upon the downward movement of the core, and means for so moving the core, and means for returning the core to normal position after each operation, substantially as described.

3. A seal-applying machine, comprising an outside stationary sleeve, a vertically-movable core in said sleeve and containing a compound plunger, the parts thereof being spring-pressed and each member capable of a movement independent of each other in the core, one member being adapted to seal the seal in the inside of the bottle-neck, and the other to engage the locking means of the seal to lock said seal in place therein upon the downward movement of the core, a vertically-movable spring-pressed lower portion, slidable in said core and adapted to be engaged by the bottle-head in the downward movement of said core to guide the ends of the plunger members into proper position to operate upon the seal, substantially as described.

4. A seal-applying machine, comprising an outside stationary sleeve,

a vertically-movable core in said sleeve and containing a compound plunger, the parts thereof being spring-pressed and each member capable of a movement independent of the other in the core, one member being adapted to seat the seal in the inside of the bottle-neck, and the other to engage the locking means of the seal to lock said seal in place therein upon the downward movement of the core, a vertically-movable spring-pressed lower portion slidable in relation to said core and adapted to be engaged by the bottle-head in the downward movement of the core to guide the ends of the plunger member into proper position to operate upon the seal, means for moving the core downward in the sleeve, means for restoring the core to normal position after each operation, and a bottle-supporting table below said core and means for adjusting said table vertically, substantially as described.

5. A seal-applying machine comprising an outside stationary sleeve, a vertically-movable core in said sleeve, bored to receive a compound plunger, comprising a two-part lower member adapted to seat the seal in the inside of the bottle-neck, and an upper member adapted to engage the locking means of the seal to lock the same in place in the bottle-neck, each member being capable of a movement independent of the other in the sleeve, a spring interposed between the two members, and a spring bearing on the upper member, a vertically-movable spring-pressed lower portion, slidable in relation to the core and adapted to be engaged by the bottle-head in the downward movement of the core to guide the ends of the plunger members to proper position to operate upon the seal, and means for restoring the core to normal position after each operation, substantially as described.

697,288. CAR-BRAKE. FRANK F. SHAFER, Cumberland, Md. Filed Jan. 14, 1902. Serial No. 92,545. (No model.)

Claim.—1. The combination with a series of car-wheels arranged in line with each other and a series of brake-shoes therefor, designed to engage the rims of said wheels above the axles thereof, brake-levers for said shoes having the arms thereof opposite the points of attachment of said shoes heavier than said shoes, and common actuating means for simultaneously applying all of said brake-shoes to said wheels, the weight of the heavier arms of said levers serving to automatically remove said shoes from engagement with said wheels when the brake-actuating mechanism is released.

2. The combination with a series of car-wheels arranged in line with each other, a pair of brakes for the central wheel of the series, and a brake for each of the end wheels of the series, of two levers, one co-operating with one of the brakes for the central wheel and with the brake for one of the end wheels, for operating them, and the other co-operating

with the other brake for the central wheel, and with the brake for the other end wheel, for operating them, and means for rocking said levers simultaneously, for applying all of said brakes at the same time.

3. The combination with a series of car-wheels arranged in line with each other, a pair of brakes for the central wheel of the series, and a brake for each of the end wheels of the series, of two levers, one co-operating with one of the brakes for the central wheel and with the brake for one of the end wheels, for operating them, and the other co-operating with the other brake for the central wheel, and with the brake for the other end wheel, for operating them, and a brake-rod secured to one of said levers and having a sliding connection with the other, whereby upon the operation of said brake-rod, both of said levers will be rocked, and all of said brakes will be simultaneously applied.

4. The combination with a series of car-wheels arranged in line with each other, a pair of brakes for the central wheel of the series, and a brake for each of the end wheels of the series, of two levers, one co-operating with one of the brakes for the central wheel and with the brake for one of the end wheels, for operating them, and the other co-operating with the other brake for the central wheel, and with the brake for the other end wheel, for operating them, and a brake-rod secured to one of said levers, and having a flexible portion therein which passes around a pulley on the other of said levers, whereby when said brake-rod is operated, both of said levers will be rocked and all of said brakes will be simultaneously applied.

5. The combination with a plurality of car-wheels arranged one in front of the other, and brake-shoes for said wheels, of brake-levers connected with said shoes fulcrumed upon the car-truck, and having their free ends extending toward each other, an equalizing-lever fulcrumed upon the car-truck, a link connecting said equalizing-lever with the free end of one of said brake-levers, a floating lever pivoted to the free end of the other of said brake-levers, and having a link connection with said equalizing-lever, and brake-actuating mechanism acting upon said floating lever for applying both of the brake-shoes to said wheels simultaneously.

6. The combination with a plurality of car-wheels arranged one in front of the other, and brake-shoes for said wheels, of brake-levers connected with said shoes fulcrumed upon the car-truck, and having their free ends extending toward each other, an equalizing-lever fulcrumed upon the car-truck, a link connecting said equalizing-lever with the free end of one of said brake-levers, a floating lever pivoted to the free end of the other of said brake-levers, and having a link connection with said equalizing-lever, an operating-lever fulcrumed upon the car-truck, and having a link connection with said floating lever, and brake-actuating mechanism acting upon said operating-lever for applying both of the brake-shoes to said wheels simultaneously.

7. The combination with a plurality of sections of a car-truck, capable of turning movement independently of each other, car-wheels carried by each of said truck-sections, and arranged one in front of the other, and brakes for said wheels, of brake-actuating mechanism for applying both of said brakes simultaneously, equalizing connections between said brake-actuating mechanism and said brakes, including a lever and a link, and a universal joint between said lever and link.

8. The combination with a plurality of sections of a car-truck, capable of turning movement independently of each other, car-wheels carried by each of said truck-sections, and arranged one in front of the other, and brakes for said wheels, of an operating-lever for applying both of said brakes simultaneously, equalizing connections between said lever and said brakes, and a universal joint between two of the parts of said equalizing connections.

9. The combination with a plurality of sections of a car-truck, capable of turning movement independently of each other, car-wheels carried by each of said truck-sections, and arranged one in front of the other, and brakes for said wheels, of brake-levers connected with said brakes, fulcrumed respectively on said truck-sections and having their free ends extending toward each other, an equalizing-lever fulcrumed upon one of said truck-sections and having a link connection with one of said brake-levers, a floating lever pivoted to the other of said brake-levers, a link pivoted to said equalizing-lever and having a universal-joint connection with said floating lever, and brake-actuating mechanism acting upon said floating lever for applying both of said brakes simultaneously.

10. The combination with a plurality of sections of a car-truck, capable of turning movement independently of each other, car-wheels carried by each of said truck-sections, and arranged one in front of the other, and brakes for said wheels, of brake-levers connected with said brakes, fulcrumed respectively on said truck-sections and having their free ends extending toward each other, an equalizing-lever fulcrumed upon one of said truck-sections and having a link connection with one of said brake-levers, a floating lever pivoted to the other of said brake-levers having a hemispherical socket in its outer end, a link pivoted to said equalizing-lever and having a link at its upper end, between the branches of which said floating lever is located, a coupling-plate bounded between the branches

of said fork provided with a ball which fits within the socket in said floating lever, and having a loop adjacent to said ball, a pivot-pin extending through said loop and through the branches of said fork, and brake-actuating mechanism acting upon said floating lever for applying both of said brakes simultaneously.

11. The combination with a pair of brake-rods longitudinally movable on the under side of a car, and operatively connected with the car-brakes, of levers connected respectively to said brake-rods fulcrumed to the under side of the car, and extending toward each other, links pivoted to the inner ends of said levers, a cross-rod connecting said links, a brake-cylinder having the piston thereof operatively connected with said cross-rod, a lever fulcrumed to the under side of the car and operatively connected to said cross-rod, and a cord or chain connected with the latter lever, by means of which the brakes may be operated by hand.

697,284. VALVE. WILLIAM P. SHUTTER, New York, N. Y., assignor to the Fairbanks Company, New York, N. Y., a Corporation of New Jersey. Filed Feb. 11, 1901. Serial No. 44,738. (No model.)

Claim.—1. The combination of the body of a valve and a bonnet therefor, each body and bonnet having overlapping engaging stems and means for securing them together, the outer engaging part having a compressing-flange provided with an inclined inner surface and the inner engaging stem having an inclined surface coating with the inclined inner surface of the outer stem, substantially as set forth.

2. The combination of the body of a valve and a bonnet therefor, the bonnet having a stem constructed to enter and engage with a stem of the body, and the bonnet having an overhanging compressing-flange with an inclined inner surface and the stem of the body having an inclined surface coating therewith, substantially as set forth.

3. The combination of the body of a valve and a bonnet therefor, the body having a screw-stem and the bonnet having a screw-stem constructed to enter and engage with the body-stem, and the bonnet having an overhanging compressing-flange with a conical inner surface and the body-stem having a conical surface mating therewith, substantially as set forth.

4. The combination with the casing of a valve, a valve-seat therein, a valve-disk coating with such seat, and means for closing such valve-disk upon its seat, of ribs integral with the casing and seat and extending from the valve-seat to the walls of the casing in opposite directions, substantially as set forth.

5. The combination with the casing of a valve, a valve-seat therein, a valve-disk coating with such seat and means for closing such valve-disk upon its seat, of longitudinal ribs integral with the casing and seat and extending from the valve-seat to the walls of the casing in opposite directions and substantially in the direction of the pressure of the valve-disk upon the seat, substantially as set forth.

6. The combination with the casing of a valve, a valve-seat therein, a valve-disk coating with such seat and a screw-stem therefor, of the longitudinal ribs 20 and 21, integral with the valve-seat and casing and extending from the valve-seat to the walls of the casing in opposite directions, and the lateral ribs 22, 23, also integral with the valve-seat and casing and extending from the face of the valve-seat to the casing, all of said ribs being substantially in the direction of pressure of the valve-disk upon the seat, substantially as set forth.

7. A valve comprising a casing, the valve-seat 17 therein, an annular curb 18 surrounding the valve-seat, a valve-disk coating with such

seat and curb, means for operating the valve-disk, and longitudinal ribs 20 and 21, integral with the valve-seat, curb and casing and extending from the valve-seat to the walls of the casing in opposite directions, substantially as set forth.

8. The combination with the casing of a valve, the valve-seat 17 therein, an annular curb surrounding the valve-seat, a valve-disk coating with the valve-seat and curb, means for operating the valve-disk, longitudinal ribs 20 and 21, integral with the valve-seat, curb and casing and extending from the valve-seat to the walls of the casing in opposite directions, and the lateral ribs 22, 23, also integral with the valve-seat, curb and casing and extending from the face of the valve-seat to the casing, all of said ribs being substantially in the direction of pressure of the valve-disk upon the seat, substantially as set forth.

9. The combination of the body of a valve and a bonnet therefor, each body and bonnet having overlapping engaging parts and means for securing them together, the outer engaging part having a compressing-flange provided with an inclined inner surface and the inner engaging part having an inclined surface coating with the inclined inner surface of the outer part, a valve-seat in each body, a valve-disk coating with such seat, a valve-stem constructed to press the valve-disk on the seat by engagement with the bonnet, and ribs integral with the body and seat and extending from the valve-seat to the walls of the body in opposite directions, substantially as set forth.

10. The combination of the body of a valve and a bonnet therefor, each body and bonnet having overlapping engaging parts and means for securing them together, the outer engaging part having a compressing-flange provided with an inclined inner surface and the inner engaging part having an inclined surface coating with the inclined inner surface of the outer part, a valve-seat in each body, a valve-disk coating with such seat, a valve-stem constructed to press the valve-disk on the seat by engagement with the bonnet, and longitudinal ribs integral with the body and seat and extending from the valve-seat to the walls of the body in opposite directions and substantially in the direction of the pressure of the valve-disk upon the seat, substantially as set forth.

11. The combination of the body of a valve and a bonnet therefor, each body and bonnet having overlapping engaging parts and means for securing them together, the outer engaging part having a compressing-flange provided with an inclined inner surface and the inner engaging part having an inclined surface coating with the inclined inner surface of the outer part, a valve-seat in each body, a valve-disk coating with such seat, a valve-stem constructed to press the valve-disk on the seat by engagement with the bonnet and longitudinal ribs 20 and 21, integral with the valve-seat and body and extending from the valve-seat to the walls of the body in opposite directions, and the lateral ribs 22, 23 also integral with the valve-seat and body and extending from the face of the valve-seat to the casing, all of said ribs being substantially in the direction of pressure of the valve-disk upon the seat, substantially as set forth.

12. The combination of the body of a valve and a bonnet therefor, the body having a screw-stem and the bonnet having a screw-stem constructed to enter and engage with the body-stem, and the bonnet having an overhanging compressing-flange with an inclined inner surface and the body-stem having a conical surface coating therewith, a valve-seat in the body, a valve-disk coating with such seat, a valve-stem constructed to press the valve-disk on the seat by engagement with the bonnet, an annular curb surrounding the valve-seat, curb and body and extending from the valve-seat to the walls of the body in opposite directions, and lateral ribs 22, 23, also integral with the valve-seat, curb and body and extending from the face of the valve-seat to the body, all of said ribs being substantially in the direction of pressure of the valve-disk upon the seat, substantially as set forth.

697,285. PRINTING ATTACHMENT FOR FLOUR-PACKERS. HARRY P. SMITH, Minneapolis, Minn. Filed Oct. 22, 1901. Serial No. 90,172. (No model.)

Claim.—1. The combination with a flour-packer and a cooperating printing device, of a single trip or controller arranged to be actuated, at will, to throw both of the said devices into action, substantially as described.

2. The combination with a flour-packer, of a printing device, and a common foot-operated controller or trip for throwing both the said devices into action, substantially as described.

3. The combination with a flour-packer having a packing-tube and a movable support for the neck, of a printing device having a type-head which is movable to and from the printing position and has a limited movement in the direction of the travel of the said support, substantially as described.

4. The combination with a flour-packer having a packing-tube and a movable support for the neck or barrel, of a printing device having a type-head mounted for movement to and from the printing position and

having a limited movement in the direction of the travel of the said support, and a common trip or controller for throwing said packer and printing device into action, substantially as described.

4. The combination with a four-packer and a printing device, of a two-part trip, a single action of which, throws both the said device into action and one section of which is movable back to normal in advance of the other, to permit the printing device to be restored to normal position before the sack has been filled, substantially as described.

697,986. TRILL-SUPPORT. WILLIAM B. SMITH, Redgum, Ill.
Filed Oct. 28, 1901. Serial No. 79,797. (No model.)

Claim.—1. A trill-support comprising a step or abutment upon the thill, in combination with a tension device upon the front bolster arranged to engage said step or abutment when under tension, and to support the thill, and means for lowering against disengagement of said device and step, substantially as specified.

2. A trill-support consisting of the pivoted lever-latch having bolster connections, the tension-spring upon the pivot-pin of said latch, and a rest-bearing for said latch carried by the bolster, in combination with the step or abutment upon the thill for engagement with said latch when under tension, to support the thill, substantially as specified.

3. A trill-support consisting of the pivoted lever-latch carried by the bolster, the tension-spring for said latch, and the rest-bearing for said latch when not in use, in combination with the step or abutment, of the thill for engagement with said latch, and the hook carried by the thill for engagement with said latch to insure its action, substantially as specified.

4. A trill-support consisting of the pivoted lever-latch carried by the bolster, the tension-spring upon the pivot-pin of said latch, and a rest-

bearing for said latch when not in use, in combination with the U-shaped clamp carried by the transverse shaft-bar, and forming a step or abutment for the latch-lever, and a hook carried by said bar, and arranged to turn over the shaft-lever to insure its action, substantially as specified.

697,987. PRESS. WHITLEY L. SPANGLER, Manchester, N. H.
Filed Oct. 2, 1900. Renewed Sept. 5, 1901. Serial No. 74,308. (No model.)

Claim.—1. In a power-press, a stationary frame, a vertically-movable frame mounted in said stationary frame and supporting a bed-plate, the said bed-plate, a spring-supported pressure-plate, and means for forcing said plates toward each other, said means comprising a diaphragm or piston for each plate mounted within oppositely-disposed caps or cylinders and pneumatic or hydraulic force introduced between said diaphragms or pistons.

2. In a power-press, a stationary frame, a vertically-movable frame mounted in said stationary frame and supporting a bed-plate, a threaded shaft and head-end fitted thereon for adjusting the frame carrying said bed-plate, a spring-supported pressure-plate, a cylindrical chamber carrying diaphragms or pistons one of which connects with the movable frame carrying the bed-plate and the other with the pressure-plate, and means for introducing pneumatic or hydraulic force centrally within said chamber for forcing said diaphragms or pistons apart.

3. In a power-press, a spring-supported pressure-plate, a vertically-movable frame carrying a bed-plate, a threaded shaft and head-end attached and adapted to adjust said movable frame, a cylindrical chamber provided with an opening for the introduction of pneumatic or hydraulic force, and diaphragms or pistons located within said chamber one piston being connected with said movable frame and the other with said pressure-plate whereby said pistons are forced apart and said plates forced toward each other by pneumatic or hydraulic force.

4. In a power-press, a frame comprising vertical standards supporting a cross-bar, a pressure-plate and suitable springs connecting the same with said cross-bar, a vertically-movable frame mounted in said cross-bar, a bed-plate attached to said movable frame, caps or cylindrical projections secured to opposite sides of said cross-bar, a piston in each cap or cylindrical projection the upper piston being attached to a shaft which is adjustably connected to the movable frame and the lower piston being connected by a shaft with said pressure-plate, and means for introducing pneumatic or hydraulic force simultaneously to said pistons, substantially for the purpose set forth.

5. In a power-press, diaphragms or pistons adapted to operate the pressure-plates for clamping the work, the said pressure-plates, a pair of connected cylinders of unequal diameter and located in the pressure-supply pipe, a piston fitted to each cylinder, a single piston-rod upon which said pistons are mounted, and a supply-opening in the larger cylinder for the admission of pneumatic or hydraulic force, whereby the work in the press may be clamped and a continuous or following pressure maintained as long as the valve controlling the supply is left open.

6. In a press, a frame comprising vertical standards supporting a cross-bar, the said cross-bar, a pressure-plate and suitable springs connecting the same with said cross-bar, a vertically-movable frame mounted in said cross-bar, a bed-plate attached to said movable frame, and a threaded shaft and head-end fitted thereto whereby said plates may be forced toward each other, substantially for the purpose set forth.

7. In a fluid-operated press, two pressure-plates, a piston or diaphragm operatively joined with each of the said plates, means for causing fluid to enter between and act upon said pistons or diaphragms to move one away from the other to thereby force said plates one toward the other.

8. In a fluid-operated press, two pressure-plates, a piston or diaphragm operatively joined with each of the said plates, means for causing fluid to enter between and act upon said pistons or diaphragms to move one away from the other to thereby force said plates one toward the other, and auxiliary means for increasing or multiplying the pressure.

9. In a fluid-operated press, a plurality of pressure-plates, a piston or diaphragm in operative connection with each of said plates and located at one side of the horizontal plane occupied by said plates, and means for introducing fluid between said pistons or diaphragms for separating them and forcing said plates toward each other.

10. In a fluid-operated press, a cylinder, a plurality of opposed pistons or diaphragms therein, means to supply fluid to said cylinders between said pistons or diaphragms and pressure-plates operatively connected with said pistons or diaphragms and actuated thereby.

697,988. TRAN-CAR. STEPHEN A. SPANGLER, Preston, and JOHN E. ADAMS, Southampton, England. Filed Feb. 4, 1902. Serial No. 82,880. (No model.)

Claim.—1. In a trans-car, the combination with a platform having the end frame D of the two vertical depending brackets C fixed at their upper ends to the side of the under frame a horizontal step B connected with the lower ends of the brackets and bridging the space between them, horizontal steps A connected at their inner ends with the brackets at a higher level than step B and extending outward in opposite directions, and supports for the outer ends of said steps connected with the frame of the car.

2. In trans-car having the combination of a platform formed with an embayment at its sides, steps A and B arranged as described, a cross-rod made to overhang the embayment a little so as not to reduce its carrying capacity, and a panel G at the end of said cross-rod located at the bottom so as to join the side of the platform, and curved inward at the sides so as not to obstruct the entry of the passenger when mounting, whereby

a passenger can ascend into the car with as much ease as if the cross-rod did not project from the sides of the platform, substantially as described.

3. In trans-car, the combination of the upright I, the panel G with ledge J and cheeks K forming a pocket for the end of the upright, and a knee-piece for holding the panel and upright in position, substantially as described.

697,989. HAT AND COAT RACK. JOHN L. SCOTT, Pittsburg, Pa. Filed Sept. 25, 1901. Serial No. 76,622. (No model.)

Claim.—In a hat and coat rack, the combination of a rectangular base-board having raised portions on its outer face at its upper end and lower side in parallel alignment, eyes secured to said uppermost portion, a rectangular wire frame carrying looped securing ends engaging said eyes, strengthening-ribs secured to said frame, a downward extension and an inverted-U-shaped loop formed in the lower portion of the said rectangular frame, a staple carried by the outer face of said lower raised portion, a loop carried by the base-board for receiving said downward extension when the device is in a locked position, a second loop secured to the outer lower edge of the base-board, a padlock engaging said staple and said last-mentioned loop, and arms secured to said base-board within said rectangular frame, substantially as described.

697,990. HUT-LOCK. JOHN J. SULLIVAN, Birmingham, W. Va.
Filed Sept. 20, 1901. Serial No. 76,747. (No model.)

Claim.—In a hut-lock, the combination with a bolt, of a nut having a recess formed therein the bottom wall of which is square and at right angles to one side wall thereof, the other side wall of said recess being at an obtuse angle to said bottom wall, a lock of a substantially rectangular form in cross-section, a series of serrations on the upper edge of said lock corresponding to the threads of said bolt, said lock being movably inserted in said recess with its bottom and one side engaging the bottom wall and right-angled wall of the recess, and adapted to have its said serrations and its other side wall engage said angular wall of the recess with its lower face out of engagement with the bottom wall of the recess when in a locked position, substantially as described.

697,991. LEADING-SPINDLE. GEORGE SMITH, Cleveland, Ohio, assignor to the Garrett-Overvill Engineering Company, Cleveland, Ohio, a Corporation of Ohio. Filed Nov. 29, 1901. Serial No. 82,022. (No model.)

Claim.—1. A leading-spindle formed of a plurality of parts connected end to end, the end sections having loose detachable connections at their outer ends arranged to support said ends, and an intermediate bearing for the spindle at or near a joint between its parts; substantially as described.

2. In leading-spindle connection, an overhanging crank, a spindle having a detachable loose connection therewith at one end and consisting of a plurality of parts having a telescopic connection and a loose supporting connection at the other end of the spindle, the telescoping connection being arranged to prevent injury from breaking of the driving connections; substantially as described.

3. A leading-spindle formed of a plurality of parts having telescopic end to end connections with each other, the end sections having loose detachable connections at their outer ends arranged to support said ends,

APRIL 8, 1902.

and an intermediate bearing for the spindle at or near a joint thereon; substantially as described.

4. A leading-spindle formed of several sections, the end sections having interlocking and supporting connections at their outer ends, one part having a cylindrical outer portion at the intermediate joint, and a bearing supporting said cylindrical part; substantially as described.

5. A leading-spindle formed in two parts, each having an interlocking connection at its outer end with the supporting-shaft, the larger part being hollow, and having an end hole with recesses, the smaller part having projections engaging said recesses, and a bearing surrounding the joint; substantially as described.

697,292. LIGHTING. RUSSELL THAYER, Philadelphia, Pa., assignor to Carbon Light and Power Company, Philadelphia, Pa., a Corporation of New Jersey. Filed Feb. 8, 1901. Serial No. 46,698. (No model.)

Claim.—1. In combination, a lantern, an incandescent burner supported above the lantern-base, a reflector detachably fitted in the top of the lantern and having a central opening provided with a marginal seat or flange, and a tubular member supported above the burner and having a shoulder, which cooperates with said seat or flange, substantially as described.

2. In combination, a lantern, an incandescent burner supported above the lantern-base, a reflector mounted in the lantern above the burner and having a central opening provided with a marginal seat or flange, and a tubular member supported above the burner and having a shoulder which cooperates with said seat or flange, said flange being perforated to provide air-passages, substantially as described.

3. In combination, a lantern, an incandescent burner supported above the lantern-base, a reflector mounted in the lantern above the burner and having a central opening provided with a marginal seat or flange, perforated for the passage of air, a tubular member supported above the burner and having a shoulder which cooperates with said seat or flange, and a non-conductor located between the shoulder and the seat, substantially as described.

697,293. FOLDING CAR-STEP. OSCAR F. THOMAS, Adams, N. Y., assignor of one-fourth to Frank S. Kanyon, Adams, N. Y. Filed Jan. 27, 1902. Serial No. 91,690. (No model.)

Claim.—1. A folding car-step, comprising in combination with the side pieces of the fixed steps, a red supported thereby, step-supporting members pivoted on said red, a pivoted step mounted on said members, angled portions of the members forming bracket-arms to receive and support the swinging edge of the pivoted step, when extended, said step adapted to be folded between the lower fixed steps of the car, as set forth.

2. In combination with the side pieces of the fixed steps of the car, the red supported thereby, folding step-supporting members, pivoted on said red, said members being forked a red supported to corresponding arms of said forked members, one arm of each member being bent at right angles, and adapted to form a bracket for supporting the free swinging edge of the step when in a horizontal position, a red under-

neath the fixed step, against which the edges of said members are adapted to contact, to hold the folding step in a horizontal position, as set forth.

3. In combination with the side pieces of the fixed step, a red supported thereby, the step-supporting members pivoted on said red, and adapted to turn in recesses in the bottom fixed step, a folding step and red carried thereby, which is pivoted on said members, the angled portions of the step-supporting members forming means to support the free swinging edge of the step, a red U mounted in the side pieces of the fixed step, and adapted to receive the notched portions of the step-supporting members, whereby the folding step when extended, is held in a horizontal position, as set forth.

4. In combination with the side pieces of the fixed steps of a car, the base of the car, the inner face of said side strips, a red supported in the curved ends of said base, the forked step-supporting members pivoted on said red, the angled arms E, and the folding step pivoted on the arms E of said members, a bar U supported by the side strips of the steps, and against which the notched edge of the step-supporting members is adapted to contact, to hold the folding step in a horizontal position when extended, as set forth.

697,294. EXTENSION LADDER. CHARLES E. TUCKER, Minneapolis, Minn. Filed Dec. 21, 1900. Serial No. 48,708. (No model.)

Claim.—1. In a ladder of the character herein shown, the combination with a stationary section and a movable section, of the clamping mechanism, embodying the reversely-threaded shaft 4, revolvably mounted in the frame of the said stationary section; the reversely-threaded jaws 5, mounted upon, and carried by the said reversely-threaded shaft, the steps 6, affixed to the said stationary section and interlocking with the said reversely-threaded jaws; and the spring 10, one end of which is affixed to the said stationary section, and the other end of which is connected with the said reversible shaft, which spring, through its reflex action rotates the said reversely-threaded shaft thereby causing the jaws adjustably mounted thereon, to respectively approach their fellows, thereby clamping the beams of the said movable section, and means for operating the said clamping mechanism, all substantially as shown and described.

2. In a ladder of the character herein shown, the combination with the stationary section, and the movable section thereof; of the clamping mechanism C, and the operating mechanism D, said clamping mechanism embodying a reversely-threaded shaft revolvably affixed in the frame of the said stationary section, reversely-threaded jaws mounted thereon and carried thereby, steps affixed to said stationary section and interlocking with the said jaws, and a spring for normally holding the said jaws in contact with the beams of the said movable section; and the said operating mechanism embodying a lever affixed upon the said reversible shaft; a pulley affixed to and revolvable with the said shaft, a ribbon affixed to the periphery of the said pulley and connected with the spring of the said clamping mechanism; and a rope to depress the said lever and to depress the said spring, substantially as shown and described.

APRIL 8, 1902.

U. S. PATENT OFFICE.

383

697,295. BRUSH. FRANK E. TUCKER, Liverpool, New York. Filed Mar. 20, 1901. Serial No. 53,698. (No model.)

Claim.—A brush for wetting surfaces comprising a compressible body having a lateral filling-opening, and a hollow extension provided with a plug, the forward open end of the body having its edges returned inwardly, a brush string said open end, the sides of the brush contacting with the returned edges of the body, and projecting beyond said edges both inwardly and outwardly, a band extending around the body adjacent to the front end, and a rest projecting from the body adjacent to the front end.

697,296. COMPRESSED-AIR WATER-ELEVATOR. GEORGE E. TYLER, Fremont, Cal. Filed Nov. 20, 1901. Serial No. 53,514. (No model.)

Claim.—1. In a compressed-air water-elevator, an eduction-pipe having its bore diminished in diameter from its intake to its discharge end, and means disposed below and spaced from the lower end of the pipe for discharging a current of air concentrically of the pipe.

2. In a compressed-air water-elevator, an eduction-pipe having its bore diminished in diameter, in a predetermined ratio, from its intake to its discharge end, and means disposed below and spaced from the lower end of the pipe for discharging a current of air concentrically of the pipe.

3. In a compressed-air water-elevator, an eduction-pipe tapered from its intake to its discharge end, and means disposed below and spaced from the lower end of the pipe for discharging a current of air into and concentrically of the pipe.

4. In a compressed-air water-elevator, the combination with an eduction-pipe having its bore diminished in diameter from its intake to its discharge end, of a nozzle adapted to discharge a tubular column of air into and concentrically of the pipe.

5. In a compressed-air water-elevator, the combination with an eduction-pipe having a tapered bore, of a nozzle having its discharge end disposed below the lower end of the pipe and constructed to project a tubular column of air into and concentrically of the pipe.

6. In a compressed-air water-elevator, the combination with an eduction-pipe having a tapered bore, of a nozzle having an annular air-discharge mouth and a centrally-disposed water passage-way.

7. In a compressed-air water-elevator, the combination with an eduction-pipe having a tapered bore, of a nozzle disposed below and spaced from the lower end of the pipe and comprising an outer tapered shell, an inner straight cylindrical shell, and an annulus connecting the lower edges of the two shells.

697,297. SHUTTER-OPERATING DEVICE. WILLIAM W. VAN DUSEN, Warwick, N. Y. Filed Jan. 21, 1900. Serial No. 51,352. (No model.)

Claim.—1. In a device of the character described, the combination of the main operating-arm, means for pivoting connecting said arm, a pair of pivotedly-connected arms or links extending outwardly from said operating-arm and connected respectively thereto, an operating chain, wire or rope passing through suitable openings in the outer ends of said main operating-arm and said pivotedly-connected links, and means for attaching one end of said operating chain, wire or rope to a fixed support, and the other end to a shutter to be operated, substantially as set forth.

2. In a device of the character described, the combination of the two main operating-arms, one of which is adapted to be rigidly attached adjacent to a window, a spring-binge pivotedly connecting said operating-arms, a pair of pivotedly-connected arms or links, one of which is pivoted to each of said operating-arms, an operating chain, wire or rope passing through suitable openings formed in said operating-arms and in the outer ends of said pivotedly-connected links, and means for attaching one end of said operating chain, wire or rope to a shutter to be operated.

3. In a device of the character described, the combination of the main operating-arm, one of which is adapted to be rigidly attached adjacent to a window, a spring-binge pivotedly connecting said arm, an adjustable connection between one member of said spring-binge and one of the operating-arms, a pair of pivotedly-connected arms or links projecting outwardly from said operating-arm and pivoted to them, an operating chain, wire or rope passing through suitable openings in said operating-arms and said pivoted links, and means for attaching said operating chain, wire or rope to the shutter to be operated, substantially as set forth.

4. In a device of the character described, the combination of the main operating-arm, means for rigidly supporting one of said arms, a spring-binge pivotedly connecting said arm, a series of ribs constituting a rack upon one of said operating-arms, a pair of pivotedly-connected links pivoted to said operating-arms and projecting outwardly therefrom, an arm or pawl pivotedly mounted upon one of said links and adapted to engage said rack, an operating chain, wire or rope passing through suitable openings formed in said operating-arms, said links, and said pawl or arm, and means for attaching one end of said chain, wire or rope to the shutter to be operated, substantially as set forth.

5. In a device of the character described, the combination of the main operating-arm, means for rigidly supporting one of said arms, a spring-binge connecting said arm, a pair of pivotedly-connected links extending outwardly from and pivoted to said operating-arms, an operating chain, wire or rope passing through suitable openings formed in said operating-arms and said pivotedly-connected links, and a plate or bar connected adjacent to one of its ends to said operating chain, wire or rope and adapted to engage the pivoted ends of a shutter for closing them, substantially as set forth.

697,298. CORNER-IRON FOR VEHICLE-BODIES. GEORGE W. VINCE, Haverwood, Ky., assignor of one-half to J. Edward Martin, Haverwood, Ky. Filed Dec. 20, 1901. Serial No. 50,723. (No model.)

Claim.—1. A corner-iron consisting of a body portion one member of which terminates at a substantially right-angle base-plate as set forth, and the other member extends below the base-plate and the member terminating at the base-plate and having its lower end bent outwardly forming a shelf substantially as shown and for the purpose set forth.

2. A one-piece corner-iron consisting of a body portion, a base-plate integral therewith, and a downward extension from one member of the body portion having a shelf at its lower end, the other member of the body portion being constructed with an upwardly-projecting head forming a support substantially as set forth for the purpose set forth.

697,299. METALLIC CROSS-TIE. JOHN J. WAGGONER, Lehigh, Pa., Ind. Filed Aug. 21, 1901. Serial No. 73,513. (No model.)

Claim.—1. A device of the class described comprising a railway steel cross-tie provided at the top with an inwardly-bent extension or integral tongue to engage the outer side flange of a rail, inner side of the

roll having either slot or an inclined groove or depression disposed longitudinally of the cross-tie, and a rail-engaging square shank or bolt extending through the opening longitudinally of the cross-tie and having a hook located at the mid slot or groove to engage the inner side flange of a rail, the outer end of the square shank or bolt is secured and fastened by a flat and edge-tapering key or nut, a transversely-disposed head or end casing which is open at its bottom, is composed of a horizontal top and slightly-inclined sides and ends, which are connected at their adjacent edges by means of tongues which are bent at right angles to embrace the adjacent walls of the head or end casing, to prevent the same from spreading, when filled with the material of which the road-bed is constructed, said head or end casing being formed of a pot-casing from a single piece of heavy sheet-steel, substantially as described.

2. A device of the class described comprising a cross-tie composed of a top and sides provided with bottom flanges, with an open channel along its bottom, said cross-tie capable of supporting one or more transversal casings, said casing having openings through both sides receiving the cross-tie, a transversal casing to be cut at different angles for accommodation of a switch or branch rail, the casing may be bolted or otherwise secured to the cross-tie, to retain it in such position, said casing being provided at opposite sides of the cross-tie with rail-engaging tongues and bolt-hooks substantially as described.

3. A device of the class described comprising a cross-tie provided with a top and having depending sides, said top being provided with an intermediate transverse support and arranged to engage a rail, and an end support disposed transversely of the rail and consisting of a casing provided with an opening receiving the cross-tie, said support being provided with a slot arranged to receive the extension of the top of the cross-tie, substantially as described.

4. A device of the class described comprising a cross-tie provided with sides and having an extension at its top bent to form a rail-engaging flange or tongue, an end support receiving the cross-tie and provided with a slot for the said extension, and a fastening device arranged to engage the rail and connecting the support and the cross-tie, substantially as described.

5. A device of the class described comprising a cross-tie provided with an inwardly-bent extension arranged to engage the outer flange of a rail, a rail-support receiving the cross-tie and provided with a slot or opening for the said extension, and a longitudinally-disposed fastening device connecting the support and the cross-tie and arranged to engage the inner side of the rail, substantially as described.

6. A device of the class described comprising a railway steel cross-tie provided with an inwardly-bent extension and projecting through a longitudinal opening at the top of the head or end casing arranged to engage the outer side flange of a rail and having a slot longitudinally of the cross-tie and a rod or square shank engaging hook or bolt extending through the slot with the outward portion of the hook or shank resting on each side of the slot and engaging the inner side flange of a rail, the said hook or bolt is locked by an extension or resilient key, the latter is shortened by bending it up between its ends, the said ends are provided with depending tongues, and after the tongues have been introduced in the longitudinal slot of the cross-tie the extension or resilient key is straightened to engage the hook or bolt and the cross-tie at the inner end of the slot, to remove said extension or resilient locking device a sharp-pointed instrument is introduced by inserting it between its ends and the cross-tie to bend it back into its original shape, whereby it may be readily attached, the other end of the rod or square shank is secured and fastened by a flat and edge-tapering key at the outer side of the head or end casing to draw and to hold the outer edge of the longitudinal slot located in the top of said head or end casing, the outer edge of the slot to come in contact in the rear of the inwardly-bent extension or the outer side rail-engaging hook, for one purpose of strengthening and supporting the latter substantially as described.

7. A device of the class described comprising a steel cross-tie, composed of a top and sides provided with bottom flanges, said cross-tie forms a groove or a hollow channel open along its bottom, a head or end casing is provided with sides, ends and a top, the corners are secured or fastened by tongues and slots or other means to prevent the same from spreading, when tamped and compressed with crushed stones, gravel and other substances, the inner and outer sides of the head or end casing are pro-

vided with bottom flanges, the ends of said head or end casing and the cross-tie which rests upon the stringer or ballast roll, are provided at the head or end casing with a depending extension 71 which conforms to the configuration of the stringer or ballast roll, the said stringer or ballast roll is held in contact with the same by means of hooks or bolts arranged at a slight inclination and extending downward and inward from the outer side of the head or end casing, the aforesaid stringer or ballast roll 5 for the purpose of resting or loading on stone ballast, bridges and on any common road-beds, and to conform to the track and to release the strain from frogs, rail joints and junctions, and the joints of the aforesaid stringer or ballast roll are designed to be arranged at points between the rail-joints, by removing the stringer or ballast roll from the head or end casing the said head or end casing is provided with suitable openings in the bottom flanges for the reception of fastenings to bridges or other structures, by leaving the depending extension and 71 of the aforesaid head or end casing in full size and bending the same out (which is not illustrated) to correspond with the side flanges, the head or end casing can be applied on stone ballast, bridges and to any ordinary road-bed substantially as described.

8. A device of the class described comprising a cross-tie provided with top and side extensions, an end support receiving the cross-tie and provided with top and side slots for the said extensions, the side extensions being bent against the support, and the top extension being bent over to engage one side of a rail, and means for engaging the other side of the rail, substantially as described.

9. A device of the class described comprising a cross-tie composed of a top and sides provided with bottom flanges, said cross-tie being cut away at the sides to form top and side extensions, a support consisting of a casing having an opening at its inner side to receive the cross-tie, and arranged at its outer side to receive the cross-tie, and provided at its outer side with upper and lower slots for the said extensions, the top extension being bent over to engage one side of a rail, and means for engaging the other side of a rail, substantially as described.

10. A device of the class described comprising a cross-tie composed of a top and sides, and an intermediate support provided with sides having openings to receive the cross-tie, said support being provided at opposite sides of the cross-tie with rail-engaging devices, substantially as described.

11. A device of the class described comprising a cross-tie, an intermediate support provided with sides having openings to receive the cross-tie and capable of lateral adjustment, and an end support fixed to the cross-tie, substantially as described.

12. A device of the class described comprising a cross-tie, having a top and sides, and an intermediate support provided at opposite sides with openings conforming to the configuration of the cross-tie and forming interior tongues, substantially as described.

13. A device of the class described comprising a head or end casing composed of a top, ends and sides 5, forms a hollow basin in its outer side, said head or end casing is locked or fastened together at the corners with tongues or other means, the head or end casing having an opening at its inner side to receive the cross-tie, the latter is provided with bottom flanges the ends of said flanges are turned downward and fastened to the inner side of the outer wall by bolts or other means, the said cross-tie having at each end and top an inwardly-bent extension arranged to engage the outer side flange of a rail, the cross-tie can be provided with either a slot or inclined groove longitudinally of the track-bed, and a hook bar or bolt extending through the opening and engaging the inner side flange of a rail, and provided at its outer side of the head or end casing or cross-tie with a key or nut for adjusting the same, the aforesaid head or end casing and cross-tie can be constructed for each of a single piece of heavy sheet-steel or the head or end casing can be pressed or rolled to construct a solid hollow basin substantially as described.

14. A device of the class described comprising a railway steel cross-tie provided with side flanges located at its bottom, an end casing or head provided at its inner wall with an opening conforming to the configuration of the cross-tie, and having extension-slots to receive the bottom flanges, means for securing the end of the flanges of the cross-tie and the outside of the outer wall of the end casing or head with bolts or other means, or the end flanges may be turned down on the outer side of said wall as clearly illustrated, a railway steel cross-tie provided with an inwardly-bent extension or tongue at its top for engaging the outer side flange of a rail, having a longitudinal slot located on the inner side of the rail in the cross-tie, and a hook shank or bolt forming a pair of shoulders adapted to rest upon the cross-tie at opposite sides of the slot extending through the opening and engaging the inner side flange of a rail, the aforesaid hook shank or bolt is also engaged by a resilient locking device consisting of a plate, said plate is shortened by bending between its ends, and provided at the inner with depending tongues, and after the tongues have been introduced into the slot the plate is straightened to engage the

hook shank or bolt and the tie at the inner end of the slot, the outer end of the hook shank or bolt is tightened by an edge tapering key or nut to draw and to hold the outer side flange located at the top of each end of the head or end casing to engage the outer side flange of a rail substantially as described.

15. A device of the class described comprising a cross-tie, a head or end casing provided at its inner side with an opening conforming to the configuration of the cross-tie and receiving the same, the end of the cross-tie fitting against the inner face of the outer side of the head or end casing, and means for securing the end of the cross-tie to the outer side of the head or end casing, substantially as described.

16. A device of the class described comprising a railway steel cross-tie, composed of a top, depending sides and ends to form a hollow trough or channel along the under side of the entire length of the cross-tie, the sides and ends are fastened at the corners with tongues and slots or other means, the anchoring bar or plate is located in the center between the sides and the top of the cross-tie, said anchor-plate is provided with tongues located at the top and ends of the plate and extended through suitable slots at the top and sides of the cross-tie and bent against the outer side and top of the cross-tie for the purpose of holding the cross-tie from spreading, and to retain the same against longitudinal movement, the aforesaid cross-tie is provided with a rail-engaging middle or chair located on top at each end of the cross-tie with flaps projecting downward on each side of the cross-tie, and fastened to the outer side of the same by girder-hooks that extend through an opening from the outer side walls of the cross-tie and turned upon the inner side of said walls, the inner side of said middle or chair is provided with crosser-hooks which extend through the opening of the slots or grooves and turned back and under longitudinally of the cross-tie, and a rail-engaging hook or bolt extending through said slots or grooves to engage the inner side of a rail and fastened at the outer side by an edge-tapering key or nut substantially as described.

17. A device of the class described comprising a steel end support or casing the number of intermediate rail-supports may be varied, and the length of the same may be changed to enable one or more rails to be mounted on the same support or casing, the intermediate support or casing is enlarged to receive the rails of the frog and the end supports or casings are extended to provide a supporting-surface for the movable portion of the switch-rail, the end supports or casings are located at the opposite sides of the switch and are constructed in the same manner, the supports or casings are provided with suitable openings in the sides to receive the cross-tie, a steel cross-tie is composed of a horizontal top and depending sides provided with bottom flanges, the said flanges are for the purpose of forming tongues or extensions to be locked or fastened to the outer side wall of the end support or casing and to strengthen the sides, the cross-tie formed beneath a hollow shape to be filled with broken stones, gravel or other heavy material of which the road-bed is constructed, one or more of the cross-ties may be extended to receive a support for a switch-stand, the fastening devices for engaging the rails are provided with a slot located in the support or casing, or the cross-tie on the inner side of the rail may be arranged in any suitable manner to correspond to the position of the rails, a shank-engaging hook or bolt extending through the slot or opening with the outward portion of the hook or shank resting on each side of the slot and engaging the inner side flange of a rail, and provided at the outer end of said shank or bolt with a slot for the reception of a flat and edge-tapering key to be driven in said slot to draw and to hold the engaging hook in contact with the inner side flange of a rail, to be made or constructed of steel or other suitable material substantially as described.

697,800. AMORON. JOHN G. WARD, Chester, Pa. Filed Sept. 24, 1891. Serial No. 74,881. (No model.)

Claim.—1. An anchor consisting of the head formed with the wings or extensions provided on the under face with a central channel, said head also carrying flanges and having middle-bearing provided with the extensions, the shank, the middle-block carried by the shank being clamped out for pin to pass through to hold in said portion.

2. The anchor, consisting of the head carrying the flanges and formed with the central enlarged portion having a shank-receiving opening and a nut or bearing on each side of the opening, the shank fitting in said opening and having the middle-block fitting in the bearing of the head, said middle-block having an open bearing-channel, one or guides on each side of said channel and a pin connecting the shank to the head.

3. An anchor consisting of the head having a central enlargement formed with a nut or bearing, the extensions on the head formed with a channel, the flanges carried by the head, the shank fitting in the head and carrying the middle-block formed with an open bearing-channel formed with a pair of ears or guides, and a pin arranged in the head and pivoting the shank therein.

697,801. TWYER FOR CUPOLA-FURNACE. STEWART WATT and FREDERICK E. WATT, Dayton, Ohio; said FREDERICK E. WATT assignor to said Stewart Watt. Filed Jan. 6, 1902. Serial No. 68,619. (No model.)

Claim.—1. In a cupola-furnace, a series of trysers adapted to form part of the lining of the cupola, each consisting of a hollow body having an air-inlet in its back and its inner or front end open, and a removable changeable face or front plate secured to and closing the inner end of each body, each plate being provided with jet-apertures, substantially as described.

2. In a cupola-furnace, the combination of a trysers consisting of a hollow casing adapted to form part of the lining of the furnace and having a removable changeable front plate provided with jet-apertures, an air-trunk exterior to the trysers and communicating with the rear and thereof, and an air-supply pipe, substantially as described.

3. In a cupola-furnace, the combination of a series of similar trysers each consisting of a hollow cylindrical casing, adapted to form part of the lining of the furnace, and having an air-blend inlet at rear but open at its front or inner end, and each trysers having a removable front plate closing its inner end and provided with a series of air-jet openings; with an air-trunk exterior to the trysers, and an air-supply pipe, substantially as and for the purpose described.

4. A trysers for cupola-furnaces, having a blast-inlet at rear, jet-apertures in its front and tubular projections within the trysers around each opening, substantially as described.

5. A trysers for cupola-furnaces, consisting of a hollow casing, having a blast-inlet in rear, a detachable front provided with jet-apertures, and tubular projections within the trysers surrounding the jet-openings substantially as described.

6. A trysers for cupola-furnaces comprising a hollow casing wider at top than at bottom, having a blast-inlet at rear, and a removable front provided with air-jet openings some of said openings having tubular projections around their inner ends within the trysers, substantially as described.

7. A trysers for cupola-furnaces consisting of a hollow casing having an air-inlet at back, removable fronts provided with jet-apertures, and intermediate vertical stays or liners, also provided with jet-apertures, substantially as described.

8. The combination with a cupola-furnace of a series of similar trysers therein each consisting of a hollow cylindrical casing, adapted to form part of the lining of the furnace, and having an air-blend inlet at rear, and a removable front plate provided with a series of air-jet openings, and inclined tubular extensions or projections on the inner face of the front covers of the jet-openings, all substantially as and for the purpose set forth.

697,802. DANDY-ROLL CLEANER. WILLIAM W. WEAVER and LEWIS H. SAMPSON, Augusta, Ga. Filed Oct. 25, 1901. Serial No. 80,280. (No model.)

Claim.—1. A cleaning device for a dandy-roll, comprising a collecting-trough situated within the roll, a deflecting-guard arranged above the roll, and a perforated fluid-supply pipe extending longitudinally of said roll.

2. The combination with a dandy-roll, of a collecting-trough, fluid supply and discharge pipes leading into the opposite ends of the roll and adapted to support the trough in position, said fluid-supply pipe being provided with a perforated section arranged above the trough in proximity to the inner surface of the roll, and a deflecting-guard arranged above said roll.

3. The combination with a dandy-roll, of a collecting-trough, a perforated fluid-supply pipe arranged within the roll and above said trough, a perforated fluid-supply pipe arranged outside and at the top of the roll, and a deflecting-guard disposed above said second pipe.

4. The combination with a dandy-roll, having hollow transverse or bones at its opposite ends, fluid supply and discharge pipes extending through said bones, a collecting-trough carried by said pipes and in communication with the discharge-pipe, a perforated pipe-section in communication with the fluid-supply pipe and arranged above the trough in proximity to the inner surface of the roll, a deflecting-guard arranged above said roll, and a perforated fluid-pipe arranged between the guard and the roll, substantially as specified.

5. A cleaning device for a dandy-roll, comprising a collecting-trough situated within the roll, and a perforated fluid-supply pipe arranged above the top of the roll, substantially as specified.

6. The combination with a dandy-roll having hollow transverse or bones 7 at its opposite ends, spiders 8 carried by said bones, a flanged rim 9 secured to the spiders, wire-guns 10 secured to said rim and forming a working surface for the roll, of fluid discharge and supply pipes 17 and 18 extending through said bones, a perforated pipe-section 21 arranged longitudinally of the roll, a connecting pipe-section 20 extending between the pipes 17 and 21, a plugged pipe or rod 22 extending between the pipe-section 21 and the discharge-pipe, a collecting-trough 23 supported by said pipes, a curved deflecting-guard 24 arranged above the dandy-roll, and a perforated pipe 20 disposed between the guard and the top of the roll and in alignment with the perforated pipe-section 21, substantially as specified.

697,808. RAIL. CHARLES C. WHITWORTH, Roanoke, Va. Filed June 11, 1901. Serial No. 84,406. (No model.)

Claim.—1. In a hydraulic ram, the combination with the air-dome and the drive-pipe, of an automatic air-supply for the air-dome, consisting of a stand-pipe having its lower end in open communication with the

drive-pipe and its upper end opening into the air-dome, said stand-pipe having an inwardly-opening air-valve intermediate its length, and having above said air-valve a nozzle a glass sight-tube and one or more check-valves opening upwardly into the air-dome, substantially as and for the purposes described.

2. In a hydraulic ram, the combination with the air-dome and the drive-pipe, of an automatic air-supply for the air-dome consisting of a stand-pipe having its lower end in open communication with the drive-pipe and its upper end opening into the air-dome, said stand-pipe having an inwardly-opening air-valve intermediate its length, a check-valve and nozzle with sight-tube above the air-valve and at a higher point a relief-valve and a second check-valve opening into the dome, substantially as shown and described.

3. In a hydraulic ram, the combination with the waste-valve having a vertical rod and a valve-seat arranged above said valve, of an opening-spring for the same arranged to be put under a resilient tension only by the last part of the movement of the valve in closing, and means for adjusting the valve-seat while in action.

4. In a ram, a waste-valve, a frame, a rod having yielding connection with the waste-valve, a sleeve adjustable in the frame and through which said rod passes, a collar on the rod above the sleeve, a spring arranged between said collar and the sleeve, a spring on the rod above the collar, and an adjustable abutment in the frame with which said last-named spring is designed to engage, substantially as specified.

5. In a ram, a spool arranged on the receiving-rod and having ports communicating therewith, a valve for controlling said ports and a supplemental quick-opening valve having a rod extended upward from the same, and a pointer on said rod above the spool, substantially as specified.

697,804. FEEDER FOR YOUNG CALVES OR COLTS. ROLLAND A. WHITFORD, Knoxville, Ind. Filed Oct. 31, 1901. Serial No. 80,008. (No model.)

Claim.—1. In a device of the class described, the combination with a nozzle, of a bar on said nozzle, a flexible gasket over said bar and projecting beyond the end of said nozzle, and a nipple snugly fitted over said gasket said nipple being held from collapsing by said gasket, substantially as described.

2. In a device of the class described, a clamp provided with a clamp for attaching it to a support and a hook for supporting a bucket, a nozzle pivoted to said clamp and having a connection thereon in line with an aperture therein, a hose-pipe attached to said connection, a curve-pipe inserted in said aperture to serve to regulate the flow of milk and to give access to the interior of the nozzle, and a nipple on the end of said nozzle, substantially as described.

697,805. POTATO PICK-UP. WILLIAM A. WILBY, Rochester, Minn. Filed May 14, 1901. Serial No. 80,205. (No model.)

Claim.—A potato pick-up consisting of two wire-mesh jaws, one fixed at the lower end of the handle and the other adapted to slide thereon, the whole operating in the manner and for the purposes set forth.

697,806. DOOR-LATCH. WILLIAM E. WILBY, St. Louis, Mo. Filed Jan. 4, 1902. Serial No. 80,917. (No model.)

Claim.—1. The combination of a door, a bar mounted on said door for turning movement, a handle for operating the bar, means independent of the handle for positively turning the bar, and a latch for engaging the bar to hold the door shut.

2. The combination of a door, a spring-actuated bar mounted on said door for turning movement, a latch for engaging the bar to hold the door shut, and means for turning the bar in opposition to its actuating-spring.

3. The combination of a door, a bar mounted on said door for turning movement, and a spring constituting a latch for engaging the bar to hold the door shut.

4. The combination of a door, a bar mounted on the door for turning movement, a handle for operating the bar, means independent of the handle for positively turning the bar, a latch for engaging the bar to hold the door shut, and means upon the bar for putting the latch into its ineffective position.

5. The combination of a door, a bar mounted on said door, a yieldable latch for engaging the bar to hold the door shut, a transverse extension upon the bar for actuating the latch, and means upon the bar for manually turning the same.

6. The combination of a door, a bracket upon the door, a bar mounted upon the bracket, for turning movement, a spring controlling the bar and connected thereto and also to the bracket, a yieldable latch for engaging the bar, and means upon the bar for actuating said latch.

7. The combination of a door having a lug, a bar mounted on the door for turning movement and having a handle, means for normally holding the handle in contact with the lug, a yieldable latch for engaging the bar to hold the door shut, and means operative with said bar for actuating the latch.

8. The combination of a door, a bar mounted on the door for turning movement and having a reduced portion, a coiled spring surrounding said reduced portion and connected to said bar and also to a fixed member, a yieldable latch for engaging the bar, and means on said bar for moving the latch into a position to release the door.

697,807. PREPARING ASPHALT. AGOSTIN WOLKEN, Ess. Victoria, Australia. Filed Jan. 4, 1902. Serial No. 80,925. (No specification.)

Claim.—In the preparation of asphalt, roasting sand and grit or particles of silicium or like matter at not substantially less than 500° Fahrenheit, cooling the mass to its normal temperature, then reheating to about 350° Fahrenheit, and mixing therewith molten bitumen or asphaltum until each particle is completely coated, substantially as described.

697,808. STREET-INDICATOR FOR STREET-CARS. JOHN G. WHELAN, St. Louis, Mo. Filed June 26, 1901. Serial No. 80,008. (No model.)

Claim.—In a street-indicator device, a casing, a glass opening formed through the casing through which the names of the streets are adapted to be read, two rolls, a flexible strip upon which the names of the streets are adapted to be represented, said strips adapted to be wound and unwound from said rolls and extend between the same, ratchet-wheel

secured to and adapted to revolve with the roll, gear-wheels journaled loosely upon said rolls, pawls pivoted to the gear-wheels and adapted to engage the ratchet-teeth of the ratchet-wheel, pivoted segments, the teeth of which are adapted to be brought into mesh with the gear-wheels, springs adapted to hold said segments normally out of mesh with the gear-wheel, armatures secured to the segments, electrical magnets arranged in juxtaposition to said armatures, means for establishing a circuit at predetermined times from the trolley-wire through one or the other of the magnets to the ground, and a switch adapted to switch one or the other of the magnets in or out of its circuit, substantially as and for the purpose set forth.

697,809. TOY BANK. WILLIAM E. YOUNG, Milwaukee, Wis. Filed June 3, 1901. Serial No. 82,708. (No model.)

Claim.—1. A bank of the kind described, comprising a receptacle having coin-slits in the top and a transparent side, the slotted coin-tubes arranged within the receptacle, the connecting-plate attached to the rear of the tubes, the block and wedges for holding the tubes in position, and the indicating scales or cards arranged adjacent to the slots of the coin-tubes, substantially as described.

2. A registering toy bank comprising a receptacle having a detachable top formed with coin-slits, said receptacle having a transparent panel at one side, the bolt for securing the receptacle and top together, the supplemental top or cap hinged to the main top, the longitudinally-slotted vertical coin-tubes arranged within the receptacle adjacent to the transparent panel, the indicating cards or scales arranged adjacent to each coin-tube, the plate connecting the tubes, and the block and wedges for securing the tubes within the receptacle, substantially as shown and described.

697,810. COLUMN-STOP. THOMAS J. YOUNGLOVE, Richmond, Va. Filed Oct. 5, 1900. Serial No. 23,112. (No model.)

Claim.—1. A column-stop consisting of an open-center frame upon which the column is adapted to rest, and legs extending inward from the frame to receive fastening devices, substantially as and for the purpose specified.

2. A column-stop consisting of a frame or rim with an open center and provided with drain and ventilation ports in its lower side, and legs extending inward from the frame to receive fastening devices, substantially as set forth.

3. A column-stop consisting of an open-center frame notched on its under side to form drain and ventilation ports, said legs being located above the bottom of the frame, substantially as described.

4. A column-stop consisting of an open-center frame, and perforated legs extending inward therefrom, in combination with fastening devices adapted to pass through said legs, and sleeves surrounding said fastening devices and forming column-stops, substantially as described.

5. A column-stop consisting of a column-supporting plate or frame, and a combined stop-fastener and column-stop adapted to extend above and beneath the plate or frame for the purpose of securing the stop in place and also preventing lateral displacement of the base of the column, substantially as described.

6. A column-stop comprising a continuous open rim provided in its

4. Means for inserting cables into conduits which comprise a self-propelled car adapted to traverse the conduit, and provided with a pivotally-mounted electric motor, means for normally disconnecting the motor to permit the car to travel rearward, and a flexible power connection attached to the car and adapted to be fed into the conduit, substantially as described.

5. Means for inserting cables into conduits, which comprise a self-propelled car adapted to traverse the conduit and provided with a pivotally-mounted electric motor, means for normally disconnecting the motor to permit the car to travel rearward, guide devices attached to the car and arranged to bear upon opposite walls of the conduit, and flexible connections attached to the car and adapted to be fed into the conduit, substantially as described.

6. Means for use in introducing a cable into a conduit, which comprise a car adapted to travel through the conduit and provided with an electric motor, means for normally disconnecting the motor to permit the car to be drawn backward, power-conductors connected with the car and adapted to be fed into the conduit as the car travels through it, and means yieldingly interposed between the car and top of the conduit for insuring proper contact of the driving-wheels, substantially as described.

7. Means for use in introducing a cable into a conduit, which comprise a car adapted to travel through a conduit and provided with an electric motor, means for normally disconnecting the motor to permit the car to be drawn backward, power-conductors connected with the car and adapted to be fed into the conduit as the car travels through it, which applied to said car and adapted to bear upon opposite walls of the conduit, and spring-pressed means attached to the car and bearing against the top of the conduit for insuring proper contact of the driving-wheels substantially as described.

697,816. NUT-LOCK. ROBERT & BUTER, Moline, Ill. Filed Feb. 4, 1901. Serial No. 92,793. (No model.)

Claim.—1. A nut-lock comprising a bolt, a nut therefor, the said bolt having its end projected beyond the outer surface of the nut, a collar adapted to engage on said projected end, means for preventing a rotary movement of the collar relatively to the bolt, a device carried by the collar for engaging with the nut, and a spring attached to the bolt and operating to hold the collar in locking position, substantially as specified.

2. A nut-lock comprising a bolt, a nut therefor, the bolt having its end extended outward of the nut, the said end being made angular in cross-section, a collar for engaging over said end, a spring secured to the bolt and having a hook end for engaging with the outer end of the collar, and a device carried by the collar for engaging with the nut, substantially as specified.

3. A nut-lock comprising a bolt, a nut for the bolt and having perforations, the said bolt having its end extended outward from the nut, the said end being made angular in cross-section, a collar for engaging over said end, means for holding the collar in position on the bolt, and fingers extended from the collar and adapted to engage in perforations in the nut, substantially as specified.

697,817. WATER-ELEVATOR. DON C. SMITH, Houston, Mo. Filed Aug. 17, 1901. Serial No. 72,266. (No model.)

Claim.—1. A water-elevator comprising a float and a fixed frame a derrick arranged upon said float and carrying guide-pulleys, and a cable, the adjustable guide-pulleys arranged in the fixed frame, the endless cables having the buckets attached thereto, said buckets being closed at one end and open at the opposite end, and the hinged blades or wings attached to the closed ends of the buckets, substantially as described.

2. A water-elevator comprising a float, the derrick arranged upon said float and carrying the guide-pulleys, a cable, the vertically-slotted fixed standards, the adjustable shaft carrying guide-pulleys and means for adjusting the said shaft vertically, the endless cables passing around the guide-pulleys, the buckets attached to the cables, the closed ends of the buckets being wider than the open ends, and the blades or wings hinged to the closed ends of the buckets and connected to the cables by ropes or chains, all arranged and adapted to operate substantially as set forth.

697,817

697,818. PROPORTIONATE SCALE. GEORGE E. BROWN, Windsor, Tex. Filed May 22, 1901. Serial No. 92,942. (No model.)

Claim.—A scale-beam, a disk mounted to rotate on one of the fulcrum-points of the beam, blocks mounted to slide on the beam at opposite sides of the fulcrum, links connecting the disk and blocks, a pan supported on one of the blocks, a loop slidable on the beam, a set-screw for holding the loop as adjusted, and a pan supported by said loop, substantially as specified.

697,819. PROCESS OF MAKING DOLOMITIC SANDSTONE. RICHARD E. BROWN, Caldwell, Mich. Filed June 19, 1901. Serial No. 93,128. (No specimens.)

Claim.—1. The process of making dolomitic sandstone, consisting in calcining the alkaline earths contained in dolomite, hydrating the calcined product, mixing with silicious combinations, and molding and heating the mixture.

2. The process of making sandstone, consisting in calcining dolomite, hydrating the mass, and chemically combining the composition with silica.

3. The process of making dolomitic sandstone, consisting in calcining alkaline earths of dolomite, adding water sufficient to form hydroxide of the said earths, adding finally, ground, or a mixture of ground and unground, compounds of silica, and curing the resultant composition.

4. The process of making artificial sandstone, consisting in subjecting silicious earths to the chemical action of the hydrated alkaline earths of dolomite.

5. The process of making artificial stone, consisting in calcining dolomite, adding sufficient water to form hydroxide, adding silicious compounds, mixing the composition with water, and molding and curing the resultant mixture.

6. A dolomitic sandstone, consisting of five to thirty-five per cent. of hydrated calcined dolomite and sixty-five to ninety-five per cent. of one or more of the various forms of silica.

7. A dolomitic sandstone, consisting of five to thirty-five per cent. of hydrated magnesium and calcium oxide, and sixty-five to ninety-five per cent. of combinations of silica.

8. A sandstone, consisting of five to thirty-five per cent. of calcium and magnesium hydroxide and sixty-five to ninety-five per cent. of silicious compounds.

9. An improvement in the art of making artificial stone, which consists in calcining dolomite by heating the same to drive off the carbon dioxide and other gases normally combined therewith, subjecting the resulting calcined substance to which the required amount of water has been added to the action of steam under pressure for the purpose of hydrating the same, next mixing the hydrated compound with a comminuted silicious substance, for the purpose of forming silicates, and finally subjecting the compounds to the action of steam and accompanying carbon dioxide, for the purpose of forming carbonates in addition to said silicates.

10. An improvement in the art of making artificial stone, which consists in removing from native dolomite the carbon dioxide and water normally combined therewith, subjecting the resulting calcined substance to which the required amount of water has been added to the action of steam under pressure for the purpose of hydrating the same, next mixing the hydrated compound with a comminuted silicious substance, for the purpose of forming silicates, and finally subjecting the compounds to the action of steam and accompanying carbon dioxide, for the purpose of forming carbonates in addition to said silicates.

mainly combined therewith, subjecting the resulting calcined substance to the action of aqueous vapor for the purpose of hydrating the same, mixing the hydrate thus formed with a silicious substance for the purpose of forming silicates, and then subjecting the mass to the action of carbon dioxide for the purpose of forming carbonates in addition to said silicates.

11. An improvement in the art of making artificial stone, which consists in calcining dolomite, hydrating the resulting substance by a distinct step and subjecting the hydrate thus formed to the independent successive action of silicates and of carbon dioxide, thus forming both silicates and carbonates.

12. An improvement in the art of making artificial stone, which consists in calcining dolomite, applying steam to the resulting substance, thus forming a hydrate, treating the hydrate thus formed with silicious substances, thus forming silicates, and subjecting the entire mass to a mixture of steam and carbon dioxide, thus forming both carbonates and silicates.

697,820. BROOM-SAVING DEVICE. THOMAS E. BROWN, Viroqua, Wis. assignor to the New Broom and Supply Company, Viroqua, Wis. Filed Oct. 2, 1901. Serial No. 77,428. (No model.)

Claim.—1. A broom-saving device comprising a pair of movable laterally-separable side clamp members constructed to fully engage upon opposite sides of a broom-head, one of said members having rigid teeth with a plurality of laterally-extending needles piercing the broom-head and having a slidable engagement with the opposite member, said needles being provided therein with longitudinal guiding-grooves.

2. A broom-saving device comprising a pair of movable laterally-separable clamp members constructed to engage upon opposite sides of a broom-head, one of said members being provided at one edge thereof with a series of holes and the opposite member also being provided at its corresponding edge with a plurality of laterally-extending longitudinally-grooved needles piercing the broom-head and engaging the said holes.

697,821. WRENCH. VOLNEY C. BROWN, Balys Harbor, Wis. Filed July 6, 1901. Serial No. 97,512. (No model.)

Claim.—In a wrench composed of two sections each of which terminates at one end in handle portions, and at their opposite ends terminating in semicircular steel-sections that are hinged together, ratchet-teeth formed upon the inner surface of each semicircular section, a head having a non-circular opening formed therein and having its periphery provided with spring-pawls that are adapted for engagement by the ratchet-teeth, and a thumb-screw carried by one of the said handle-sections and arranged for engagement with a recess formed in the opposite section for locking the said sections together, substantially as described.

697,822. CAN-STRAINING MACHINE. CHARLES E. BUNNELL, Baltimore, Md. Filed May 15, 1901. Serial No. 93,577. (No model.)

Claim.—1. A can-straining machine comprising a box or casing open at the ends, steam-supplying pipes at the lower portion of the casing, means for moving the cans through the casing, and elevated supports for the can-carrier, so disposed that the cans during their travel will be maintained close to the top of the casing, substantially as specified.

2. A can-straining machine comprising a box or casing open at the ends, pipes for supplying steam to the interior of said casing at the lower portion thereof, grooved longitudinal supports for the cans extending

through the casing, and mounted above the bottom thereof, and endless chains running in said grooves and having projections extending above the tops of the cans, substantially as specified.

697,823. PENCIL-SHARPENER. ROBERT BAKER, Lakeview, Ore. Filed Aug. 16, 1901. Serial No. 72,264. (No model.)

Claim.—1. A pencil-sharpener, comprising a handle, a blade pivoted upon the handle near one end thereof, and an arm pivoted by one end on the pivot of the blade, and rockable toward the sharp edge of said blade for support of the end of a pencil to be sharpened by said edge of the blade.

2. A pencil-sharpener, comprising a handle, a blade sharp on one edge, and pivoted by one end at an end of the handle, said blade having a longitudinal slot in its heel, and a bent arm pivoted in the slot of the blade-heel on the blade-pivot, which adapts the arm to rock toward and from the sharp edge of the blade for support of a pencil end to be cut by the blade.

3. A pencil-sharpener, comprising a supported blade, having a slot in its heel, a bent arm pivoted at its heel in the slotted heel of the blade, and means to limit the rockable movement of the arm on its pivot.

4. A pencil-sharpener, comprising a handle, a blade pivoted at one end in an end of the handle, said blade having a beveled side and a straight side, and a bent arm pivoted with the blade in the handle.

5. A pencil-sharpener, comprising a handle, a blade having a beveled side and a straight side, the sharp edge of the blade sloping convexly toward the point, and a bent arm pivoted to fold with the blade and receive adjustment toward and from the sharp edge of the blade.

6. In a pencil-sharpener of the character described, the bevel-sided blade having its cutting edge convexly sloped toward the point of the blade, and the rockable arm bent to provide a foot at its free end, the end wall of said foot being grooved, and the edge of the arm adjacent to the edge of the blade having a plurality of indentations therein.

697,824. ADJUSTABLE RIDGOL FOR WINNERS. CHARLES E. CASTELL and WILLIAM B. FAIR, Little River, Kans. assignors of one half to Charles E. Hamilton, Little River, Kans. Filed Mar. 4, 1901. Serial No. 95,102. (No model.)

Claim.—A shaking-shed having a shaft 2 journaled therein, a worm-wheel on said shaft, a set-shaft having a worm engaging said worm-wheel, supporting-bars attached to, and supported solely by said shaft 2, said bars having side flanges 6 and end flanges 7 on their upper sides, and a removable screen or riddle supported on said adjustable bars, adapted to be lifted therefrom and engaged by the flanges thereof, said bars being

laterally adjustable on said shaft to adapt them to receive and support ridges or curves of various widths, substantially as described.

697,825. BOTTLE-CARRIER. OLIVER F. CLARK, St. Louis, Mo. Filed Aug. 26, 1901. Serial No. 78,250. (No model.)

Claim.—1. A bottle-carrier comprising a series of strips extending in one direction, a series of crossing strips, and wires running in the direction of the greater transverse dimension of the strips passing alternately from opposite sides through slots in the strips and drawing them together edgewise.

2. In a bottle-carrier, the combination of crossing strips formed with slots, and wires secured to the upper row of strips and threaded through the slots by passing them alternately first on one side of the strips and then on the other side, substantially as set forth.

3. In a bottle-carrier, the combination of crossing strips, wires threaded through the strips, and a row of bottom strips through which the wires are passed and to which they are connected so that when the last-mentioned strips are turned horizontally they will act to tighten said wires, substantially as set forth.

4. In a bottle-carrier, the combination of crossing strips, and a series of wires secured to the upper row of strips and threaded through slots in the intermediate strips and which are connected to the lower row of strips in a manner whereby the lower row of strips act as levers to tighten the wires, substantially as set forth.

5. A bottle-carrier consisting of crossing strips and wires connecting the strips together and so connected to the strips as to prevent lateral movement of the strips, substantially as set forth.

6. In a bottle-carrier, the combination of crossing strips, wires connecting the strips together, and a row of bottom strips to which said wires are connected in such a manner as to permit said bottom strips to be turned flatwise, when the carrier is opened to form a bottom to the carrier, substantially as set forth.

697,826. DENTAL APPLIANCE. GEORGE H. CLAUER, Annapolis, Md. Filed July 2, 1901. Serial No. 67,644. (No model.)

Claim.—1. In a dental furnace, the combination with a support, a vertically-adjustable arm carried thereby, and a burner beneath said arm; of a cylindrical furnace supported by said arm, and a heating device adapted

to be removably supported upon the said furnace, substantially as described.

2. In a dental furnace, the combination with a support, an adjustable arm carried thereby, and a burner beneath said arm; of a cylindrical furnace supported by said arm, and a curved deflecting-head provided with an exit in one side carried by said furnace, substantially as described.

3. In a dental furnace, the combination with a support, a vertically-adjustable arm carried thereby, and a burner beneath said arm; of a furnace supported by said arm, a covering of asbestos upon the outside of said furnace, and a device adapted to receive articles to be heated, removably secured to said furnace, substantially as described.

4. In a dental furnace, the combination with a support, an adjustable arm carried thereby, and a burner beneath said arm; of a furnace having a flange adapted to rest in said arm, and a curved head having an opening in one side carried by said furnace, substantially as described.

5. In a dental furnace, the combination with a base, an adjustable arm mounted thereon, provided with a ring upon one end, and a burner located beneath said ring; of a cylindrical furnace, resting in said ring, and provided with an annular flange for supporting the same, and a recess in the upper end of said furnace, and a curved head having an opening in one side adapted to rest upon said furnace, and a flange upon said head adapted to lock with said recess, substantially as described.

6. An investment-cup adapted to be used in combination with a dental furnace, comprising a woven-wire cup, having a filling of asbestos or the like, into which is adapted to be embedded the crown of a tooth, substantially as described.

7. An investment-cup adapted to be used in combination with a dental furnace, comprising a woven cup of flexible wire adapted to be bent in any desired shape, and a filling of spongy asbestos, within said cup, substantially as described.

697,827. AUTOMATICALLY-OPERATED REED AND PIPE ORGAN. JAMES W. CHURCH, Boston, Mass., assignor of one-half to Winchester Veneer, Brookline, Mass. Filed Sept. 2, 1901. Serial No. 74,817. (No model.)

Claim.—1. In an organ automatically operated by means of a perforated music-sheet, the combination with the stop-valves and the lever-and-rod mechanism for operating the same, of supplemental levers for operating the stop-valve rods to open the stop-valves, pneumatic mechanism for operating said supplemental levers, means for retaining each supplemental lever after being depressed to hold open the stop-valve connected therewith, and electrically-operated mechanism controlled by the music-sheet for controlling the operation of said pneumatic mechanism.

2. In an automatically-operated organ, the combination with the stop-valves and the lever-and-rod mechanism for operating the same, of a series of supplemental spring-pressed levers provided with bolts through which loosely pass the stop-valve rods, the latter having bottoms or nuts on which said levers rest to draw down said rods, independent pneumatic mechanism for actuating each lever to open the stop-valve connected therewith, means controlled by the music-sheet for independently operating the pneumatic mechanism of each of said levers, and a retaining device consisting of a pivoted spring-pressed rocker-board having a longitudinal shoulder, and arms projecting from said levers and adapted to engage said shoulder, whereby, each lever after being depressed to open its stop-valve may be retained to hold said valve open, or when retained may be released to permit said valve to be closed.

3. In an automatically-operated organ, the combination with the stop-valves and the lever-and-rod mechanism for operating the same, of a series of supplemental levers provided with bolts through which loosely pass the stop-valve rods, the latter having bottoms or nuts on which said levers rest to draw down said rods, independent pneumatic mechanism for actuating each lever to open the stop-valve connected therewith, an electric circuit for the pneumatic mechanism of each supplemental lever, said circuit containing a magnet for actuating the primary puppet-valve of said pneumatic mechanism, a music-sheet provided with longitudinal rows of metallic spots or portions acting as circuit-closers, whereby said pneumatic mechanism is brought into action, and a retaining device, whereby each supplemental lever, when depressed to open its stop-valve, may be retained in position to hold said stop-valve open, or when retained may be released to permit said stop-valve to be closed.

4. In an automatically-operated organ, the combination with the motor for actuating the music-sheet and its inlet-valve, of pneumatic mechanism for moving said valve in a direction to open the same, pneumatic mechanism for moving said valve in the opposite direction to close the same, and means controlled by the music-sheet for independently controlling the operation of each of said pneumatic mechanisms.

5. In an automatically-operated organ, the combination with the motor for actuating the music-sheet and its inlet-valve, of pneumatic mechanism for moving said valve in a direction to open the same, pneumatic mechanism for moving said valve in the opposite direction to close the same, and electrically-operated mechanism controlled by the music-sheet for independently controlling the operation of each of said pneumatic mechanisms.

6. In an automatically-operated organ, the combination with the motor for actuating the music-sheet, and its inlet-valve, of pneumatic mechanism for moving said valve in a direction to open the same, pneumatic mechanism for moving said valve in the opposite direction to close the same, an electric circuit for each of said pneumatic mechanisms, said circuit containing a magnet for actuating the primary puppet-valve of said pneumatic mechanism, and a music-sheet provided with longitudinal rows of metallic spots or portions acting as circuit-closers, whereby said pneumatic mechanisms are independently brought into action to effect the opening or closing of said motor-valve.

7. In an automatically-operated organ, the combination with the motor for actuating the music-sheet and its inlet-valve and valve-rod, of friction feed mechanism for intermittently moving said valve-rod in opposite directions, whereby said valve may be gradually opened or closed, mechanism connected with said valve-rod to indicate the amount of movement of said valve, pneumatic mechanism for actuating said valve-rod feed mechanism, and means automatically controlled by the music-sheet for controlling the operation of said pneumatic mechanism.

8. In an automatically-operated organ, the combination with the motor for actuating the music-sheet and its inlet-valve and valve-rod, of a rack-bar secured to the valve-rod, a gear in mesh with said rack-bar, a friction-wheel fast on the shaft of said gear, a pair of levers fulcrumed on the gear-shaft and arranged on opposite sides of the friction-wheel, sliding shoes mounted on said levers and adapted to be brought into contact with the friction-wheel to intermittently rotate the same in opposite directions, rods for moving said levers and friction-shoes, means for withdrawing the shoes from contact with the friction-wheel, pneumatic mechanism for independently actuating said rods and friction-shoes to open or close the motor-valve, and means automatically controlled by the music-sheet for independently controlling the operation of each of said pneumatic mechanisms to vary the speed of the motor.

9. In an automatically-operated organ, the combination with the motor, its inlet-valve and valve-rod, the latter provided with a rack-bar, the gear meshing with said rack-bar, and the friction-wheel on the gear-shaft, of a lever fulcrumed on the gear-shaft, a friction-shoe secured to a sliding spring-pressed rod mounted on said lever, a bell-crank pivoted to said sliding rod, a forked rod embracing the end of the lever, pneumatic mechanism for actuating said forked rod, and a throw-off device mounted on said lever and adapted to disengage said bell-crank from said forked

rod to relieve the friction-wheel of the pressure of the sliding shoe, substantially as described.

697,828. CUFF-HOLDER. PAUL CONNOR, Keywest, Fla. Filed Nov. 14, 1901. Serial No. 82,301. (No model.)

Claim.—1. A cuff-holder, comprising two clamping-arms having opposed fingers on their free ends, a longitudinally-extended sleeve at the opposite ends of said arms, a bent arm having a cylindrical end on which the sleeve is loosely mounted, means to restrict end play of the sleeve on one end of the arm, and a locking-plate held to rock on the other end of the bent arm.

2. A cuff-holder, comprising two clamping-arms formed one within the other, said arms having laterally-extended fingers at like ends of the arms, and oppositely-bent curves thereon between the ends of the arms, a sleeve having a spring-finger at one edge, a bent arm having a tubulation at one end wherein spaced beads are formed, the spring-finger engaging one of said beads, and a locking-plate held to rock on a ring-eye formed on the opposite end of the bent arm.

3. A cuff-holder, comprising a bent arm having a ring-eye on one end, a locking-plate held to rock on the ring-eye and having a spring-tongue adapted to engage its free end in notches formed in the edge of the ring-eye, a tubulation on the opposite end of the bent arm, having a bead at each end, two clamping-arms formed one within the other and having clamping-fingers adapted to press one toward the other, a sleeve on the opposite end of the clamping-arms, said sleeve being fitted upon the tubulation and having a finger adapted to bear on one of the beads, and tubulations in the clamping-arms, which when compressed are adapted to spread apart the clamping-fingers.

4. A cuff-holder comprising an arm bent at a right angle and having a ring-eye on one end, a locking-plate held to rock on said arm upon said ring-eye, a latch-tongue formed integral with the locking-plate and adapted to engage its free end in either of two notches in the ring-eye, two clamping-arms having clamping members laterally projected at their free ends, and means for rockably connecting the other ends of the arms with the remaining end of the bent arm.

5. The combination with an arm bent at a right angle, and two clamping-arms connected together near one end of each arm and having laterally-projected clamping members at similar ends thereof, of a rockable joint between an end of one clamping-arm and an adjacent end of the bent arm, comprising a longitudinally-extended tubulation on the bent arm, a sleeve on the clamping-arm loosely mounted on the tubulation, two bead formations on the tubulation loosely contacting with respective ends of the sleeve, and a spring-finger on one end of the sleeve, adapted to contact with an adjacent bead.

697,829. BELT AND SHIRT-WAIST CONNECTOR. JOHN H. CHAMBERLAIN, Washington, D. C. Filed Aug. 6, 1901. Serial No. 71,068. (No model.)

Claim.—1. The combination of a shirt-waist having a waistband provided with openings, a belt having loops to pass through the openings, and a band or tape adapted to be threaded through said loops to secure the belt to the waistband, substantially as described.

2. The combination of a shirt-waist having a waistband provided

at its ends with buttonholes and between the same with openings, a belt having loops to project through said openings, and a band or tape to be threaded through said loops to connect the belt to the waistband, and provided at its ends with buttons to engage the buttonholes in the waistband, substantially as described.

697,880. TUBE-CLAMP. WILLIAM DE FREITAS, New York, N. Y. Filed Nov. 7, 1901. Serial No. 51,296. (No model.)

Claim.—1. A tube-clamp comprising two clamping members for engaging opposite sides of a tube and a lever member having extensions at an angle to the body, and arms projected from the extensions substantially parallel with the body, one of the clamping members having bearings at the ends of the arms and the other clamping member having bearings at the ends of the extensions, substantially as specified.

2. A tube-clamp, comprising two clamping members for engaging opposite sides of a tube, and a lever member consisting of a substantially U-shaped top portion having an extension at an angle to the body and arms at the ends of the extension projected substantially parallel with the body, one of the clamping members having bearings at the end of the arms, and the other clamping member having bearings at the end of said extensions, substantially as specified.

3. A tube-clamp, comprising two clamping members for engaging opposite sides of a tube, one of said clamping members having portions extended at substantially right angles to its body and terminating in outwardly-extended lugs, the other of said members having at its ends outwardly-extended lugs, and a lever member having a U-shaped body portion, portions extended at substantially right angles to the body portion, and arms projecting from said extensions forming eyes to receive the lugs last mentioned, and the said arms having eyes at the ends to receive the lugs first mentioned, substantially as specified.

697,881. BOILER-TUBE CLEANER. CORNELIUS T. DEMAREZ, Rochester, N. Y. Filed Apr. 22, 1901. Serial No. 54,572. (No model.)

Claim.—1. A tube-cleaner, comprising a horizontal head provided with a plurality of spaced cutters projecting from the respective front and rear ends thereof, said cutters being biased by V-shaped webs connecting said cutters with the main body of said head, said webs being partially cut away at the rear end of said head so as to admit the end of a rod for the purpose of manipulating the head.

2. A tube-cleaner, comprising a longitudinal head provided with a plurality of substantially tongue-shaped cutters, spaced apart and projecting from the respective front and rear ends thereof, said cutters alternating with slots which extend throughout the length of the head and communicate with each other by means of undercut recesses extending beneath the cutters.

3. A tube-cleaner, comprising a longitudinal head provided with a plurality of substantially tongue-shaped cutters projecting from the respective front and rear ends thereof, the said cutters at their bases being joined to the main body of the head, and the middle of said cutters standing asunder from said main body but connected thereto by webs.

697,882. FRIED-SCREW ADJUSTMENT. JOHN DUNN, Pen Ar-
cyle, Pa. Filed Nov. 20, 1901. Serial No. 54,188. (No model.)

Claim.—1. The combination of a feed-out, the upper end of which is externally threaded, an adjusting-nut arranged above the feed-out and adjustable thereon, and means for locking the adjusting-nut, as set forth.

2. The combination of a feed-out the upper end of which is threaded externally, an adjusting-nut arranged upon the threaded end of said feed-out, and the locking-nut for securely locking the adjusting-nut in position, as set forth.

3. The combination with the feed-out threaded at its upper end, of the adjusting-nut arranged upon said threaded end, a jam-nut arranged upon the threaded end of the feed-out and below the adjusting-nut, and the locking-nut arranged upon the adjusting-nut and adapted to bear upon the jam-nut, substantially as set forth.

4. The combination of a feed-out, the upper portion of which is externally threaded, an adjusting-nut, the lower end of which is recessed

said recessed portion being internally and externally threaded, the upper end of the feed-out engaging the interior threads, a jam-nut arranged upon the threaded portion of the feed-out and below the adjusting-nut, and a locking-nut arranged upon the adjusting-nut and bearing upon the jam-nut, substantially as set forth.

697,883. FOLDING CARRIAGE. CHARLES E. FARRER, Devon
port, Iowa, assignor to Folding Wheel Carriage Company, Des Moines,
Iowa, a Corporation of Iowa. Filed June 5, 1901. Renewed Feb. 27,
1902. Serial No. 55,524. (No model.)

Claim.—1. A folding vehicle, comprising a front seat-supporting frame, a rear seat-supporting frame, a reach pivotedly connecting said frames with each other, front and rear axle-carriers mounted to swing on said frames and controlled by said reach, wheels journaled on said axle-carriers, a seat fulcrumed on the front seat-supporting frame, spring-supported slides movable on the rear seat-supporting frame and on which the rear part of the seat is fulcrumed, and a seat-back fulcrumed on said slides and arranged to swing rearward into an inclined position relatively to the seat, as set forth.

2. A folding vehicle, comprising a front seat-supporting frame, a rear seat-supporting frame, a reach pivotedly connecting said frames with each other, front and rear axle-carriers mounted to swing on said frames and controlled by said reach, wheels journaled on said axle-carriers, a seat fulcrumed on the front seat-supporting frame, spring-supported slides movable on the rear seat-supporting frame and on which the rear part of the seat is fulcrumed, and spring-controlled pivoted seat sides and a seat-back fulcrumed on said slides and arranged to rest on the rear ends of said seat sides, as set forth.

3. A folding vehicle, comprising a front seat-supporting frame, a rear seat-supporting frame, a reach pivotedly connecting said frames with each other, front and rear axle-carriers mounted to swing on said frames and controlled by said reach, wheels journaled on said axle-carriers, a seat fulcrumed on the front seat-supporting frame, spring-supported slides movable on the rear seat-supporting frame and on which the rear part of the seat is fulcrumed, a seat-back fulcrumed on said slides and arranged to swing rearward into an inclined position relatively to the seat, and a locking device controlled by said seat-back for locking the seat to said slides, as set forth.

4. A folding vehicle, comprising a front seat-supporting frame, a rear seat-supporting frame, a reach pivotedly connecting said frames with each other, front and rear axle-carriers mounted to swing on said frames and controlled by said reach, wheels journaled on said axle-carriers, a seat fulcrumed on the front seat-supporting frame, spring-supported slides movable on the rear seat-supporting frame and on which the rear part of the seat is fulcrumed, and a locking device under the control of the operator, for locking the front axle-carrier in an extended position, said locking device comprising pivoted arms and lugs on the front axle-carriers, as set forth.

5. A folding vehicle, comprising a front seat-supporting frame, a rear seat-supporting frame, a reach pivotedly connecting said frames with each other, front and rear axle-carriers mounted to swing on said frames and controlled by said reach, wheels journaled on said axle-carriers, a seat fulcrumed on the front seat-supporting frame, spring-supported slides movable on the rear seat-supporting frame and on which the rear part of the seat is fulcrumed, a locking device under the control of the operator, for locking the front axle-carriers in an extended position, said locking device comprising locking-arms pivoted on said front seat-supporting frame, a cross-bar connecting the locking-arms with each other, and lugs on said front axle-carriers and adapted to be engaged by said locking-arms, as set forth.

6. A folding vehicle having a locking device for the front axle-carriers, comprising locking-arms pivoted on the front seat-supporting frame, a cross-bar connecting said arms with each other, and lugs on said axle-carriers and adapted to be engaged by said locking-arms, as set forth.

7. A folding vehicle having a rear seat-supporting frame, slides spring-supported on said frame, a seat pivoted on said slides, a seat-back fulcrumed on said slides, and a locking device controlled by said back for automatically locking the seat to the slides, as set forth.

8. A folding vehicle having a rear seat-supporting frame, slides spring-supported on said frame, a seat pivoted on said slides, a seat-back fulcrumed on said slides, a locking device controlled by said back for automatically locking the seat to the slides, said locking device comprising spring-arms on the seat and adapted to be engaged by said back, and pins carried by said spring-arms and adapted to pass into registering apertures in the seat and the slides, as set forth.

9. A folding vehicle having a seat, a seat-back hinged to the seat, said back fulcrumed on the seat and extending rearwardly beyond the seat, and supports on the rear ends of the slides for the seat-back to rest against and extend in an inclined position relatively to the seat, as set forth.

10. A folding vehicle having a seat, a seat-back hinged to the seat, said back fulcrumed on the seat and extending rearwardly beyond the seat, supports on the rear ends of the slides for the seat-back to rest against and extend in an inclined position relatively to the seat, and means on the rear ends of the seat sides, for locking the back in a rearmost position, as set forth.

11. In a folding vehicle, the combination with front and rear frames, of wheel-carriers mounted to swing on said frames and each provided with a gear-wheel, and a reach having at each end bearings mounted on the cross-bars of the frames and each provided with a gear-wheel, the said gear-wheels meshing with the gear-wheels of the wheel-carriers, as set forth.

12. In a folding vehicle, the combination with front and rear frames, of wheel-carriers mounted to swing on said frames and each provided with a gear-wheel, the gear-wheels on the front-wheel carriers being provided with projections on their upper faces, a reach having at each end bearings mounted on the cross-bars of the frames and each provided with a gear-wheel, the said gear-wheels meshing with the gear-wheels of the

wheel-carriers, and pivoted locking-arms for engaging the projections of the said gear-wheels, as set forth.

13. In a folding carriage, the combination of front and rear frames, the rear frame being provided with spring-pressed slides, a reach pivotedly connecting said frames, wheel-carriers mounted to swing on said frames and controlled by the reach, a seat having its forward end pivoted to the front frame and its rear end to the spring-pressed slides of the rear frame, a seat-back pivoted to the said spring-pressed slides, and seat sides pivoted to the seat and adapted to fold on the rear side of the seat-back when the vehicle is folded, as set forth.

14. In a folding vehicle, the combination with front and rear frames, of a seat pivotedly connected with the said frames, a pivoted seat-back, seat sides pivoted to the seat and extending rearwardly beyond the seat, said sides being adapted to fold on the rear face of the back when the vehicle is folded, and means for securing the back to the sides to hold it in a rearmost position as set forth.

15. In a folding vehicle, the combination with front and rear frames, of a seat pivoted to the front frame, spring-pressed slides on the rear frame and to which the rear portion of the seat is pivoted, and a locking device for engaging one of the slides to lock the seat thereto, as set forth.

16. In a folding vehicle, the combination with front and rear frames, of a seat pivoted to the front frame, spring-pressed slides on the rear frame and to which the rear portion of the seat is pivoted, a pivoted back, and a spring-pressed locking device for engaging one of the slides to lock the seat thereto, said locking device being controlled by the back, as set forth.

17. A folding vehicle comprising front and rear frames having up-right side arms, a reach pivotedly connecting said frames, wheel-carriers mounted to swing on the said frames and controlled by the reach, a seat pivotedly connected with the frames, seat sides pivoted to the seat, a pivoted seat-back normally held in locking engagement with the rear portions of the seat sides, a handle having its side arms hinged to the side arms of the frame, and a locking device for locking the handle side arms to the frame side arms, as set forth.

697,884. PUMPER. WALTER W. FARRER, Boston, Mass. Filed
June 18, 1901. Serial No. 54,718. (No model.)

Claim.—A game apparatus comprising a flat circular base A a circular wall arranged thereon, said base having a depression arranged centrally of the wall, a hollow sphere having a single opening, and a solid sphere of a size adapted to fit into the central depression, and also pass through the opening in the sphere, substantially as described.

697,885. MEASURING INSTRUMENT. IRA B. HAGAN, North
Lanndon, Mo., assignor of three-fifths to Frederick W. Hagan and Cole-
man Hagan, North Lanndon, Mo.; Ira B. Hagan, Jr., Edward F. Hagan,
D. Page Hagan, and Percy M. Hagan and Lowella F. Crane, Crane,
Mo. Filed Aug. 18, 1901. Serial No. 72,157. (No model.)

Claim.—A measuring instrument, comprising a base-rule, a protractor-plate having at the lower end thereof a spirit-level carried longitudinally of the base-rule, a perpendicular rule, the lower end of which is slidably mounted on the base-rule, an angle-rule pivotally mounted on the lower end of the base-rule and movable over the protractor-plate, and an arm fastened rigidly to the protractor-plate and projecting outward from the base-rule and thence parallel therewith, for the purpose specified.

697,886. TOPOGRAPHIC. JESSE HANNEY, Austin, Tex. Filed June 20, 1891. Serial No. 61,340. (No model.)

Claim.—1. In a topographic, a substantially U-shaped body portion, triangular in cross-section, constructed of base and having an upper smooth scraping edge, and a series of bristles suitably connected to the lower surface of said body portion.

2. In a topographic, a body portion substantially triangular in cross-section, having an upper smooth scraping edge, a brushing means connected to the lower surface of said body portion, and a handle connected to each end of said body portion.

697,887. COASTED-BRAKE FOR VEHICLES. ROBERT E. KAHN, Philadelphia, Pa. Filed July 22, 1891. Serial No. 61,339. (No model.)

Claim.—1. The combination in a combined brake and clutch, of a driving member having oppositely-placed cam-surfaces, and a bearing-surface, a driven member having bearing-surfaces of which one is placed to cooperate with the bearing-surface of the driving member, a stationary member, a piece having a cam-surface directly operative upon one of the surfaces of the driving member and a second piece also having a cam-surface, the same being operative directly upon the second cam-surface of the driving member and on the same side thereof as the first piece, substantially as described.

2. The combination of a driving member having oppositely-placed cam-surfaces and a bearing-surface, a driven member, two bearing-surfaces of which one is placed to cooperate with the bearing-surface of the driving member, a fixed member and two rings having cam-surfaces placed to act directly upon the cam-surfaces of the driving member, one of said rings acting between the driving member and the driven member, the second ring being placed on the same side of said driving member as the first ring and acting between the driving member and the stationary member, substantially as described.

3. The combination of a driving member having oppositely-placed cam-surfaces at right angles to its axis and a bearing-surface, a driven member having two bearing-surfaces of which one is placed to cooperate with the bearing-surface of the driving member, a stationary member and two rings each provided with a cam-surface, substantially as described.

4. The combination of a sprocket-wheel having at one side a bearing-surface, a wheel-hub provided with bearing-surfaces of which one co-operates with the bearing-surface of the sprocket-wheel, a relatively stationary member, a series of oppositely-placed cam-surfaces upon the sprocket-wheel at right angles to the axis thereof, a ring having cam-surfaces constructed to act in connection with one series of cam-surfaces upon the sprocket-wheel whereby said wheel is moved longitudinally and is operatively coupled with the hub, said ring also bearing upon a second bearing-surface of the hub when the sprocket-wheel revolves at a higher rate of speed than that of said hub, together with a second ring also having cam-surfaces placed to coast with the second series of cam-surfaces on the sprocket-wheel to retard the motion of the hub when said sprocket-wheel is turned backward, substantially as described.

5. The combination of a sprocket-wheel having upon it two oppositely-placed series of cam-surfaces, two rings of a wedge-shaped section, each having cam-surfaces upon one edge and constructed to engage the cam-surfaces upon the sprocket-wheel, the hub having two inclined sur-

faces upon it, one placed to be engaged by one of the rings and the other placed to be engaged by the sprocket-wheel, and a relatively stationary piece also having an inclined surface placed to be engaged by the second ring, substantially as described.

6. The combination of a sprocket-wheel having two series of oppositely-placed cam-surfaces and a bearing-surface, two rings of a wedge-shaped section provided with cam-surfaces placed to correspond with the cam-surfaces of said wheel, a hub provided with two oppositely-inclined bearing-surfaces, and a relatively stationary piece, substantially as described.

7. The combination of a sprocket-wheel having upon it two oppositely-placed series of cam-surfaces, two concentric rings each having a cam-surface placed to cooperate with a surface of the sprocket-wheel, a hub provided with an inclined bearing-surface, an adjustable piece fixed thereto, a relatively stationary piece, the inner one of said rings acting to couple the hub to its sprocket, when said sprocket is revolved at a rate of speed higher than that of the hub, and the outer ring acting to free the stationary piece against the piece fixed to the hub when the sprocket is turned backward, substantially as described.

697,888. PROCESS OF UTILIZING WASTE-RUBBER GRAP. THOMAS HANSEN, Burlington, N. J., assignor to the Manufactured Rubber Company, Metuchen, N. J.; and Philadelphia, Pa., a Corporation of New Jersey. Filed May 8, 1891. Serial No. 61,338. (No specimens.)

Claim.—1. As a new article of manufacture, a composition of matter consisting of refuse rubber, gutta-percha, one or more of the natural soft rubber gums and an oil substance.

2. As a new article of manufacture, a composition of matter consisting of refuse rubber, gutta-percha, one or more of the natural soft rubber gums, and a filling material.

3. As a new article of manufacture, a composition of matter consisting of refuse rubber, gutta-percha, one or more of the natural soft rubber gums, an oil substance and a filling material.

4. As a new article of manufacture, a composition of matter comprising refuse rubber, paraffin, stearine and oil substance, in about the proportions named.

5. As a new article of manufacture, a composition of matter comprising refuse rubber, gutta-percha, one or more of the natural soft rubber gums, oil substance, and barytes, in about the proportions named.

6. The process herein described of utilizing refuse rubber, said process consisting in mixing the same in a finely-commingled state with gutta-percha preferably ground with the rubber, and a suitable quantity of oil substance, and then subjecting the entire mass to the action of steam under pressure.

7. The process herein described of utilizing refuse rubber, said process consisting in mixing said rubber with gutta-percha, one of the natural soft rubber gums, and an oil substance, reducing said mass to a finely-commingled state by grinding and then subjecting the ground material to the action of steam under pressure.

8. The process herein described of utilizing refuse rubber, said process consisting in mixing said rubber with gutta-percha, one of the natural soft rubber gums, an oil substance, and a filling material, reducing said mass to a finely-commingled state by grinding and then subjecting the ground material to the action of steam under pressure.

9. The process herein described of utilizing refuse rubber, said process consisting in mixing said rubber with gutta-percha, one of the natural soft rubber gums, an oil substance, and barytes in about the proportions named, reducing said mass to a finely-commingled state by grinding, and then subjecting the mass to the action of steam under pressure, substantially as described.

697,889. FUR AND GLOVE SEWING MACHINE. MORRIS HANSEN, London, England. Filed Aug. 21, 1891. Serial No. 72,991. (No model.)

Claim.—1. In a fur and glove sewing machine the combination with the looper-hook stem, of a bearing or support for the rear end thereof in which the looper-stem is fitted to slide, a transverse horizontal axis on which said bearing is mounted to revolve, the said bearing being adapted to permit both longitudinal reciprocating movement of the said stem and vibrating movement thereof about said axis, a bearing or support for the front end of the stem, said end being adapted to be incapable of longitudinal motion relatively thereto, and means for operating the looper-stem, comprising a radius arm or arms pivotally connected to said front bearing and adapted to receive angular motion about an axis transverse to the said stem, as so to thereby impart to said stem both longitudinal sliding motion and also vibrating motion in its vertical plane about the transverse axis at its rear end, and mechanism for imparting the said movement to the radius arm or arms, as specified.

2. In a fur and glove sewing machine, the combination with the looper-hook stem of a bearing or support for the rear end thereof, adapted to permit both longitudinal reciprocating movement of the said stem and vibrating movement thereof about a transverse horizontal axis situated at the said bearing, a front bearing or support for said stem as connected to said mass as to be incapable of longitudinal movement relatively thereto, and means for operating the looper-stem comprising a radius arm or arms in pivotal connection with said front bearing and adapted to receive angular motion about a transverse axis, an eccentric in the main shaft, and means intermediate thereof and of said radius arm or arms whereby the rotation of the eccentric is caused to impart vibrating movement in an arc to the said radius arm or arms, and thereby to impart combined longitudinal sliding and vibrating motion to the looper-stem, substantially as specified.

3. In a fur and glove sewing machine, the combination with the looper-hook stem as mounted as to be adapted to receive longitudinal reciprocating motion, vibrating motion about a transverse horizontal axis at its rear end, and rocking motion about its own longitudinal axis, of means for imparting the said reciprocating and vibrating motion to the looper-stem, and mechanism for imparting the rocking motion to the said stem about its own longitudinal axis, the said mechanism comprising a cam on the main shaft, a bell-crank lever having one arm engaged in the cam-groove and the other arm coupled to a laterally-projecting arm fixed on the looper-hook stem by an intermediate link and universal joints to permit of the relative movement of the parts, as described.

4. In a fur and glove sewing machine, the combination with the looper-hook stem, and a rear guide-bearing in which the looper-stem is fitted to slide, the said bearing being mounted to revolve on a transverse axis, of a front bearing through which the looper-stem passes, the front bearing being held against longitudinal movement on the stem, a transverse bearing carrying the front bearing, and means for operating the looper-stem, comprising a shaft mounted to rock, radius-arms carried by the rock-shaft and to which the said transverse bearing is pivotally connected, an eccentric on the main shaft of the machine, and a rod connecting the eccentric-rod with an arm on the rock-shaft, whereby the rotation of the eccentric will cause the radius-arms to impart to the looper-stem a longitudinal sliding movement and a vibrating movement in its longitudinal vertical plane, substantially as specified.

5. In a fur and glove sewing machine, the combination with the main shaft of the machine, the looper-hook stem, the bearings for the same, and means for imparting a longitudinal reciprocating motion and vibrating motion in a vertical plane to said looper-stem from the main shaft, of means for imparting a rocking motion to the looper-stem about its own longitudinal axis, the said means comprising a cam-disk revolving with the main shaft and provided with a groove, a bell-crank lever fulcrumed on a fixed point and having one arm provided with a roller engaging the groove of the cam, a collar fixed on the stem of the looper-hook and having a laterally-projecting arm, and a link connected by universal joints with the said laterally-projecting arm and the other arm of the bell-crank lever, substantially as described.

697,840. WHIFFLER-CHUYLER. FREDERICK H. HANSEN, and WILLIAM F. KELL, Mason, Ohio. Filed Feb. 4, 1892. Serial No. 61,336. (No model.)

Claim.—1. A whiffler-blending comprising a socket-plate fastened to the shaft or frame of a vehicle and provided with a recess in its rear edge, a plate secured to the under face of a singletree and having a projected portion which is received in said socket-plate, a leg-carrying plate secured to the upper surface of the singletree, and a spring-clip fastened at its lower end to the shaft or frame and having a socket member at its upper end adapted to spring over said leg on the upper surface

of the singletree, said clip adapted to engage in the recess in the edge of the socket-plate, as set forth.

2. A fastening for singletrees comprising in combination with the shaft or frame, a socket-plate having a flange extending over one edge of the shaft, the outer face of said flange being recessed, a swivelled plate fastened to the under surface of the singletree and provided with a flanged edge extending about the edge of the singletree, a leg on said swivelled plate seated in said socket, a plate fastened to the upper face of the singletree and having a leg, a spring-clip fastened at its lower end to the under face, the upper end of said clip having a socket which is adapted to spring over the leg on the plate fastened to the upper face of the singletree, the stem of said clip adapted to rest in said recessed flange to hold same from lateral movement, as set forth.

697,841. WHEEL. ADAM L. HENRY, Hartford, Conn. Filed Sept. 17, 1890. Serial No. 59,200. (No model.)

Claim.—A wheel, comprising a rim, oppositely-disposed rim-flanges of angular cross-section connected to opposite edges of the inner periphery of said rim, flexible side walls connected to said rim-flanges, concentric hub-rings carried by each of said walls, one of said rings being internally threaded, and a hub passed through said rings and provided with an annular shoulder at one end and presented to the adjacent end of the hub and external screw-threads adjacent to its opposite end, said shoulder and screw-threads being adapted for engagement with the hub-rings.

697,842. MECHANICAL MOVEMENT. MORRIS HANSEN, London, E. I. Filed Aug. 21, 1891. Serial No. 72,990. (No model.)

Claim.—1. A mechanical movement comprising a crank-arm, a crank-pin movable radially with reference to the axis of rotation of the crank-arm, mechanism for revolving the crank-arm, and continuously-running power-driven mechanism for changing the position of the crank-pin provided with device for at times allowing the crank-pin to remain stationary and at times to move.

2. A mechanical movement comprising a crank-arm, a crank-pin moving radially with reference to the axis of rotation of the crank-arm, mechanism for revolving the crank-arm, and separate mechanism acting automatically at times on the crank-pin to move it radially on the crank-arm.

3. A mechanical movement comprising a crank-arm, a crank-pin movable radially with reference to the axis of rotation of the crank-arm, and mechanism for automatically controlling the relative movements of

the crank-pin and crank-arm to cause the crank-pin to describe arcs of different radii during a single revolution of the crank-arm and to repeat these movements during successive revolutions, substantially as described.

4. A mechanical movement comprising a crank-arm, a crank-pin movable radially with reference to the axis of rotation of the crank-arm, mechanism for automatically controlling the relative movements of the crank-pin and crank-arm to cause the crank-pin to describe one or more arcs and one or more straight paths during a single revolution of the crank-arm, and to repeat these movements during successive revolutions, substantially as described.

5. A mechanical movement comprising a crank-arm, a crank-pin movable radially with reference to the axis of rotation of the crank-arm, mechanism for rotating the crank-arm, device for temporarily stopping the revolution of the crank-arm, and mechanism for moving the crank-pin radially while the crank-arm is at rest.

6. A mechanical movement comprising a crank-arm, a crank-pin movable radially with reference to the axis of rotation of the crank-arm, means for intermittently rotating and stopping the crank-arm, and means for moving the crank-pin while the crank-arm is stationary.

7. The combination of a crank-arm, a shaft on which it is mounted, power-driven mechanism for driving said shaft, a crank-pin movable radially with reference to the axis of rotation of the crank-arm, a shaft connected with the crank-pin, separate power-driven mechanism operating said last-mentioned shaft, and device for automatically starting and stopping the rotation of said crank-pin-operating shaft.

8. The combination of a crank-arm, a shaft on which it is mounted, a crank-pin mounted radially with reference to the axis of rotation of the crank-arm, an eccentric connected with the crank-pin, a shaft to which the eccentric is secured, gearing for operating the crank-shaft, power-driven gearing for operating the eccentric-shaft, and device for automatically starting and stopping the rotation of said eccentric-shaft.

9. The combination of a crank-arm, a drive-shaft to which it is secured, a pinion on said shaft, a crank-pin movable radially in guides on the crank-arm, an eccentric, an eccentric-rod connected with the crank-pin, a shaft to which the eccentric is secured, a pinion on said shaft, power-driven mechanism connected with the pinion of the crank-operating shaft, and power-driven mechanism connected with the pinion of the eccentric-shaft provided with device for at times moving said eccentric-shaft, and at times holding it stationary.

10. A mechanical movement comprising a crank-arm, a crank-pin moving radially with reference to the axis of rotation of the crank-arm, means for driving the crank-arm, and mutilated gearing for operating the crank.

11. A mechanical movement comprising a crank-arm, a crank-pin movable radially with reference to the axis of rotation of the crank-arm, mutilated gearing for driving the crank-arm, and mutilated gearing for operating the crank-pin.

12. The combination of a crank-arm, a shaft from which it projects laterally, a crank-pin extending into a radial groove in said arm, an eccentric-ring to which the crank-pin is attached, an eccentric operating said ring, a shaft to which said eccentric is secured, pinions secured to said shaft, and mutilated gearing driving said pinions.

697,848. FEED AND WATER DEVICE FOR CHICKENS. GEORGE C. LATIMER, Washington, D. C. Filed July 14, 1901. Serial No. 69,472. (No model.)

Claim.—1. A feed and water device for poultry consisting of a pan or basin and a conical body or cover having a plurality of corrugated continuous troughs each of which increases in width and in depth toward the base and terminates in an open end.

2. A feeding and watering device for poultry consisting of vertically-inclined corrugated walls forming contiguous and continuous troughs open at their lower ends, and a pan or basin the rim of which forms a seat for the lower ends of the troughs.

3. In a feeding and watering device for poultry, the combination with a corrugated device forming a plurality of vertically-inclined contiguous and continuous troughs open at their lower ends, a pan or basin the rim of which forms a seat for the lower ends of the troughs, and hooks on the outer ridges of the corrugations adapted to detachably engage the edge of the basin to hold the separate trough part in proper relation thereto.

697,844. EYELET. FRANK J. LEMOND, Knoxville, Tenn. Filed June 12, 1901. Serial No. 69,399. (No model.)

Claim.—1. A belt-eyelet, comprising two members each having an oblong hollow undivided shank and a head, the head being in the form of a flange extending outwardly and curved inwardly, the edges of the flanges being serrated, one of the shanks being provided with a plurality of shoulders on each side and the other with a tongue on each side adapted to spring into engagement with the shoulders, as set forth.

2. A belt-eyelet, comprising two members, each having an oblong hollow undivided shank and a head, one of the shanks being of yielding material and provided with a rigid tongue on each side and the other with a plurality of shoulders on each side, whereby the opposing sides of the shank carrying the tongues will spring inward toward each other when the said shank is forced into the other shank to allow the passage of said tongues and permit them to snap into engagement with the shoulders with which they will be held in engagement by the elasticity of the sides of the shank, as set forth.

697,845. SOLDERING-MACHINE. JAMES M. E. LORSON and FRANK W. BOWEN, Vancouver, Canada. Filed Mar. 9, 1901. Serial No. 69,473. (No model.)

Claim.—1. In a machine of the class described in combination; two rectangular pillars vertically arranged at opposite ends of a solder-bath, having an angled cam-railway thereover; right-angled brackets having rectangular openings to receive said pillars, and means for fixing each bracket at the desired elevation; wheels mounted on the brackets, and a sprocket-chain having laterally-projecting fingers thereon, taking therearound; a support-plate having a channel for the chain integral with the cam-railway, and means for imparting movement to the wheels carrying the chain.

2. A machine for the purposes described, comprising in combination, a furnace, a solder-bath, extending lengthwise and over the top thereof, pillars at each end of the furnace; upper and lower brackets vertically adjustable on the pillars, chain-wheels mounted on said brackets, an endless chain taking around the several chain-wheels, to pass under the furnace and over the top thereof, a cam-railway on the top of the furnace having an inclined portion extended over the solder-bath, said chain having laterally-projecting fingers to engage the cam, all being arranged substantially as shown and for the purposes described.

697,846. ENGINE. WILLIAM B. LEMMON, Piedmont, S. D., assignor of four-tenths to George C. Hunt, Rapid City, S. D., and Glad Olson Lyng, Christopher Derbyshire Hooper, and Michael James Gillman, Piedmont, S. D. Filed June 7, 1901. Serial No. 69,471. (No model.)

Claim.—An engine, comprising a cylinder having an inwardly-disposed web-like portion, a shaft running centrally through the cylinder, a piston fastened to the shaft at each side of said web-like portion of the cylinder and having web-like portions lying alongside of the web-like portion of the cylinder, all of each web-like portion having registering annular or tubular steam-passages with V-shaped ribs or vanes therein, said vanes being set oppositely in each of said web-like portions, and means for conducting the motive fluid to and from the said steam-passages.

697,847. CASH-CARRIER. DAVID LEVY, Mansfield, Ohio, assignor to the Mansfield Cash and Package Carrier Co., Mansfield, Ohio. Filed Dec. 24, 1901. Serial No. 57,671. (No model.)

Claim.—1. In a store-service apparatus, the combination of the hangers or brackets, the upper spring-bulb, the lower track-wire, and the foot, of the bifurcated clip hinged to said foot and holding one end of the lower track-wire, a spring buffer-bar guided in said clip, the inclined rod, the case mounted to slide thereon, and to rest normally on said clip, and the upper track-wire secured to said case, substantially as described.

2. In a store-service apparatus, the combination of the hanger or bracket, the upper spring-bulb, the lower track-wire, and the foot, of the bifurcated clip hinged to said foot and holding one end of the lower track-wire, a spring buffer-bar guided in said clip, the inclined rod, the case mounted to slide thereon and to rest normally on said case, the upper track-wire secured to said case, and a car-retainer, a latch thereon, and cushioning-springs, all substantially as shown and described.

3. In a store-service apparatus, the combination of the hanger or bracket, the upper spring-bulb, the lower track-wire and the foot, of

the bifurcated clip hinged to said foot and holding one end of the lower track-wire, a spring buffer-bar guided in said clip, the inclined rod, the case mounted to slide thereon and to rest normally on said clip, the upper track-wire secured to said case, a car-retainer, a latch thereon, cushioning-springs, and stops carried by said latch, all substantially as described.

697,848. RAILROAD-LANTERN. EDWIN LOVE and WILLIAM RAY, Panama, Mo. Filed July 8, 1901. Serial No. 57,499. (No model.)

Claim.—1. In a lantern, the combination of a revolvable match-magazine having a ratchet-wheel, a spring-dog engaging said ratchet-wheel, a wick-ruler, a lever to operate said dog and said wick-ruler, a match guide and igniter, and means, carried by said lever to feed the matches successively from said magazine to said match guide and igniter, substantially as described.

2. In a lantern, the combination of a revolvable match-magazine, having a ratchet-wheel, a bowed spring-dog fast at one end, adapted to lengthen to engage and rotate said ratchet-wheel and said magazine by a step-by-step movement, a lever to operate said spring-dog, a match guide and igniter and means carried by said lever to feed the matches successively from said magazine to said match guide and igniter, substantially as described.

3. The combination of a revolvable match-magazine having a series of peripheral match-retaining pockets and springs to displace the lower ends of the matches outwardly from said pockets, a match guide and igniter and a lever having an engaging finger to successively engage the lower displaced ends of the matches and feed the latter successively from said magazine to said match guide and igniter, substantially as described.

4. The combination with a burner, of a wick-ruler, a pivotally-supported match-igniter, a match-magazine and means to simultaneously feed a match from the magazine to the igniter, and operate the wick-ruler, substantially as described.

5. The combination with a burner, of a wick-ruler, a pivotally-supported match-igniter, a match-magazine means effective when moved in one direction to simultaneously feed a match from the magazine to the igniter, and operate the wick-ruler, and a snuffer, operated by the initial movement of the wick-ruler-operating means, to trim the wick, and moved by the reverse movement of said wick-ruler-operating means, clear of the wick, substantially as described.

6. The combination with a lantern, of a tubular match guide and igniter pivotally mounted, a match-holder and means to feed a match therefrom to said match guide and igniter, the latter being arranged to topple to one side by the leverage of the match, to apply the match to the wick, substantially as described.

7. The combination with a burner, of a tubular match guide and igniter pivotally mounted, and means to feed a match, longitudinally into and partly through said match guide and igniter, whereby the match will be ignited, and whereby the leverage of the match will cause the match guide and igniter to topple to one side to apply the ignited match to the wick, substantially as described.

8. The combination with the lantern of a match guide and igniter mounted for axial movement, and means to feed a match thereto, said match guide and igniter being adapted to topple to one side by the leverage of the match to displace the latter across the wick, substantially as described.

9. The combination of a revolvable match-magazine having peripheral match-receiving pockets, a fixed match-retainer, in which said magazine rotates, said retainer having an opening in one side, springs to displace the lower ends of the matches outwardly from said pockets, through said opening, a lever having means to engage the lower ends of the matches successively as they are presented to said opening, and cause the matches from said magazine, and means operated by said lever to rotate said magazine by a step-by-step movement, substantially as described.

10. The combination of a reversely-threaded screw-shaft, screw-arms thereon, engaged thereby and movable by said screw-shaft toward and from each other, a rod connecting said screw-arms and on which rod said screw-arms play, a spring mounted at a fixed point and having its free end attached to said rod, and means to rotate said screw-shaft, in reverse directions alternately, substantially as described.

11. In a lantern, the combination of a screw-shaft, a screw-armed thereby, a spring connected to the screw-armed to normally depress the latter, a lever connection between the latter and said screw-shaft to rotate said screw-shaft in reverse directions alternately, a match guide and igniter, and means, operated by said lever, to feed a match to said match guide and igniter, substantially as described.

12. The combination of a burner, a wick-raiser, a match guide and igniter pivotally mounted for oscillatory movement, and means to operate said wick-raiser, and to feed a match to said match guide and igniter, substantially as described.

13. The combination of a burner, a wick-raiser, a match guide and igniter, a lever, and means connected thereto, to operate said wick-raiser and feed a match to said match guide and igniter, substantially as described.

14. The combination of a burner, a wick-raiser, a match guide and igniter, a match-magazine, a lever and means, connected to said lever, to operate said wick-raiser and feed a match from said magazine to said match guide and igniter, substantially as described.

697,849. STEAM-TRAP. GEORGE HAPPEL, Philadelphia, Pa., assignor to James Smith and Company, Incorporated, Charleston, W. Va., a Corporation of West Virginia. Filed Feb. 7, 1901. Serial No. 66,488 (No model.)

Claim.—1. A steam-trap in which are combined a steam-tight casing, having an outlet therefrom, an expansion-tube contained entirely within said casing and having a valve-seat at its free end, a valve adapted to said seat, a rod connecting said valve and casing, whereby the admission of steam into the space between the two is prevented, and lever mechanism interposed between the expansion-tube and the valve, also contained within the casing, and serving to transmit movement from the tube to the valve, substantially as described.

2. A steam-trap in which are combined a casing, an expansion-tube contained therein and having a valve-seat at its free end, a valve adapted to said seat, a lever interposed between the expansion-tube and the valve, and a stud rotatably mounted on the casing of the trap and having an eccentric head serving as a fulcrum for said lever, substantially as specified.

3. A steam-trap in which are combined a steam-tight casing, an expansion-tube contained therein, and having a valve-seat at its free end, a valve adapted to said seat, a lever interposed between the expansion-tube and said valve and also combined within the casing, and a rod-crow for limiting the opening movement of the valve, substantially as specified.

697,850. FOCAL-PLANE SHUTTER. LEONARD MONETTI, Turin, Italy, assignor to the Thompson Patent Manufacturing Company, Limited, Altrincham, England. Filed Sept. 12, 1901. Serial No. 75,214 (No model.)

Claim.—1. In a focal-plane shutter for photographic purposes, the combination with the roller *f* a blind in two parts with a slit between and bands *m* attached to one part of the blind, and passing through eyes in the other part to connect the two, of an inner roller to which the part *c* of the blind and the bands *m* are attached and wound thereon in opposite directions, mechanism for rotating the inner roller, and an outer roller with a slit through which the blind and bands pass to the inner one, and upon the periphery of which the blind and bands are wound in the same direction substantially as described.

2. A focal-plane shutter for photographic purposes comprising in its construction a blind in two parts *c* and *b*, and bands *m* attached to the part *c* passing through eyes *f* in the part *b*, a roller *g* to which the part *b* of the blind is attached, an inner roller *g* to which the part *c* of the blind and the bands *m* are attached and wound in opposite directions, mechanism to rotate the roller *g*, an outer driving-roller *e* upon the periphery of which the blind and bands are wound, and a driving-spring *2* to actuate the roller *e* in one direction when released, all arranged substantially as described.

3. A focal-plane shutter for photographic purposes comprising in its construction a blind in two parts *c* and *b*, and bands *m* attached to the part *c* passing through eyes *f* in the part *b*, a roller *g* to which the part *b* of the blind is attached, an inner roller *g* to which the part *c* of the blind and the bands *m* are attached and wound in opposite directions, a knob *l* and pinions *u* to rotate the roller *g*, an outer driving-roller *e* upon the periphery of which the blind and bands are wound, and a driving-spring *2* to actuate the roller *e* in one direction when released arranged substantially as described.

4. In a focal-plane shutter for photographic purposes the combination with the roller *g*, means to hold and release the roller, the blind in two parts *c* and *b* and bands *m* to connect the two parts of the blind and provided with a slit *c* between them, of the inner roller *g* to which the part *c* of the blind and the bands *m* are both attached but wound in opposite directions, the knob *l* and wheels *u* to rotate the roller *g*, the outer roller *e* with slit *p* around which the blind and bands are wound in the same direction, and the driving-spring *2* attached to the outer roller *e* to operate it substantially as described.

697,851. OIL-SEPARATOR. JAMES H. MCCLAVE, FRANK H. ELLIOT, and BENNETT E. CHASE, Denver, Colo. Filed May 14, 1901. Serial No. 59,806. (No model.)

Claim.—1. An electromagnetic oil-separator, comprising opposite electromagnets, a drum of non-magnetic material movable between the poles of the magnets, projecting pole-pieces on one of the magnets, a carrier movable over the lower magnet, a hopper adjacent to and discharging directly into said carrier, and bands of magnetic material supported on the drum, substantially as specified.

2. An electromagnetic oil-separator, comprising electromagnets of opposite polarity, a drum of non-magnetic material movable between the poles of the magnets, pole-pieces attached to one of the electromagnets and having ends extended in the direction of rotation of the drum, bands of magnetic material surrounding the drum, and a carrier movable be-

tween the magnets, the said carrier being adjustable as to pitch, substantially as specified.

3. An electromagnetic oil-separator, comprising electromagnets of opposite polarity, a revolving drum movable between the poles of the magnets, one of said magnets being arranged within said drum, a series of shoes or pole-pieces attached to said magnet within the drum and having their ends extended beyond the magnet in the direction of rotation of the drum, bands of magnetic material surrounding the drum, a carrier-belt movable between the drum and the lower electromagnet and a driving frame on which the belt is mounted, substantially as specified.

4. An electromagnetic oil-separator, comprising opposite pole electromagnets, a drum mounted to rotate and within which one of the poles of the magnet is located, the said drum having peripheral channels, bands of magnetic material nested in said channels, a driving frame, a driving-pulley carried by said frame, rollers on the frame, an endless band passing around said rollers and movable between the electromagnets, and a hopper for discharging material onto said band, substantially as specified.

697,852. BOW-BOTTLE. JAMES W. MCCHESNEY, Lexington, Mass. Filed Oct. 30, 1901. Serial No. 66,412. (No model.)

Claim.—1. The combination with a bottle having a short neck and a neck mainly rectangular in cross-section curving on said neck, of a bottle-plate device insertible in the rectangular part of the neck, and a locking device comprising opposite catches in the neck and short neck, and pins seated on springs in the catches in the neck, adapted to enter the catches in the neck when said neck is curved fully on the neck.

2. The combination with a bottle having a short neck, a rounded nipple extended from the neck, and a partly-rectangular neck threaded at one end and curving on the nipple, of a pin-and-catch device for holding the neck on the nipple when the neck is in place, a circular-edged valve adapted to seat on the nipple, a non-removable weight flexibly connected with the valve, said connection passing through a guide-bar, and an insertible slapping-passing device held in the angular portion of the neck.

3. The combination with a neck cylindrical formed at its discharging end, threaded internally at the opposite end and rectangular in cross-section between said ends, of two bottle-plates having angular wings projected in the neck-here as to provide a slapping passage therethrough, and means for holding said plates opposite each other and for preventing their displacement.

4. The combination with a bottle, a short neck thereon having an externally-threaded nipple at its upper end of reduced diameter, providing an annular shoulder outside of the nipple, of a neck internally threaded to screw on the nipple, a pin-like joint-rod between the shoulder on the neck and the end of the nipple, the nipple and engaged end of the neck having catches that may be closed with each other, and spring pressed pins in the catches in the neck, that will enter the catches in the nipple when the neck is seated on the washer.

5. The combination with a bottle, a short neck thereon, and a nipple on the neck, of a valve seating on the nipple, a guide-bar supported centrally in the nipple, a flexible connection extended from the valve through the guide-bar, a weight-block on the lower end of the flexible connection

and a check-bar loosely secured between its ends to the lower end of the weight-block, the ends of the check-bar having engagement with recesses in the bottle-neck.

697,853. APPARATUS FOR SCREENING CROUCHING GRASS OR OTHER MATERIALS. WALTER McDONNELL, London, England. Filed Mar. 22, 1901. Serial No. 66,564. (No model.)

Claim.—1. In a screening device, a main tank subdivided into reception and discharge chambers separated by a screen, the chamber below the screen being closed against inflow of water except through the screen, the upper chamber being provided with a restricted discharge-passage on a level with the upper surface of the screen and leading into a water-chamber, a water-supply for said water-chamber adapted to maintain a head of water therein substantially the same as that in the main tank, so as to prevent interflow, a discharge for the water-chamber, a separate discharge in the main tank for the slimes and water which have passed through the screen, and means for feeding the material under treatment into the chamber above the screen and for causing it to move thereon.

2. In a screening device, a main tank subdivided into reception and discharge chambers separated by a screen, the chamber below the screen being closed against inflow of water except through the screen, the upper chamber being provided with a restricted discharge-passage on a level with the upper surface of the screen and leading into a water-chamber, a water-supply for said water-chamber adapted to maintain a head of water therein substantially the same as that in the main tank, so as to prevent interflow, a discharge for the water-chamber, a separate discharge in the main tank for the slimes and water which have passed through the screen, means for feeding the material under treatment into the chamber above the screen and for causing it to move thereon, and means for automatically discharging the slimes from beneath the screen.

3. In a screening device, a main tank subdivided into reception and discharge chambers separated by a screen, the chamber below the screen being closed against inflow of water except through the screen, the upper chamber being provided with a restricted discharge-passage on a level with the upper surface of the screen and leading into a water-chamber, a water-supply for said water-chamber adapted to maintain a head of water therein substantially the same as that in the main tank so as to prevent interflow, a discharge for the water-chamber, a separate discharge in the main tank for the slimes and water which have passed through the screen, means for feeding the material under treatment into the chamber above the screen and for causing it to move thereon, a float in the water-compartment, a valve on the slime-discharge valve in the main tank and connection between the float and valve for automatically regulating the discharge of slimes.

4. In a screening device, a main tank subdivided into reception and discharge chambers separated by a screen, the chamber below the screen being closed against inflow of water except through the screen, the upper chamber being provided with a restricted discharge-passage on a level with the upper surface of the screen and leading into a water-chamber, a water-supply for said water-chamber adapted to maintain a head of water therein substantially the same as that in the main tank so as to prevent interflow, a discharge for the water-chamber a separate discharge in the main tank for the slimes and water which have passed through the screen, means for feeding the material under treatment into the chamber above the screen, a closed compartment communicating with the chamber beneath the screen and a plunger so working in said compartment as to impart a pulsating movement to the water through the screen.

5. In a screening device, a main tank subdivided into reception and discharge chambers separated by a screen, the chamber below the screen being closed against inflow of water except through the screen, the upper chamber being provided with a restricted discharge-passage on a level with the upper surface of the screen and leading into a water-chamber, a water-supply for said water-chamber adapted to maintain a head of water therein substantially the same as that in the main tank so as to prevent interflow, a discharge for the water-chamber, a separate discharge in the main tank for the slimes and water which have passed through the screen and means for feeding the material under treatment into the chamber above the screen, a closed compartment communicating with the chamber beneath the screen and a plunger so working in said compartment as to im-

part a pulsating movement to the water through the screen, and means for automatically discharging the slime which have passed through the screen.

6. In a screening device, a main tank subdivided into reception and discharge chambers separated by a screen, the chamber below the screen being closed against inflow of water except through the screen, the upper chamber being provided with a restricted discharge-plunge on a level with the upper surface of the screen and leading into a water-chamber, a water-supply for said water-chamber adapted to maintain a head of water therein substantially the same as that in the main tank so as to prevent interflow, a discharge for the water-chamber, a separate discharge in the main tank for the slime and water that have passed through the screen and means for feeding the material under treatment into the chamber above the screen, a second compartment communicating with the chamber beneath the screen and a plunger or working in said compartment so as to impart a pulsating movement to the water through the screen, a float in the water-compartment, a valve in the slime-discharge in the main tank and connections between the float and valve for automatically regulating the discharge of slime.

697,854. BELT-GUIDE. CHARLES McKIM, WILLIAM RAYNE, and WILLIAM RAYNE, White, N. H. Filed Aug. 14, 1901. Serial No. 71,302. (No model.)

Claim.—1. A belt-guide, comprising a frame provided with a belt receiving aperture and separable into two members flexibly connected together, each of said members being provided with rollers disposed at different angles relatively to each other, for the purpose of engaging independent surfaces of the belt.

2. A belt-guide, comprising a frame made of substantially U-shaped members hinged together, a clasp for rigidly securing said members in the general shape of a rectangle, and an idle roller disposed directly across said rectangle so as to separate the same into compartments.

697,855. FOLDING CRATE. AUGUST J. KELT, Memphis, Tenn. Filed Aug. 14, 1901. Serial No. 71,307. (No model.)

Claim.—1. In a folding crate a rectangular bottom wall, a like top wall, two side walls each formed of two sections hinged together, hinges connecting edges of the side walls with edges of the top wall, two end walls hinged at lower edges on projections from the bottom wall at opposite edges said end walls being adapted to hold the side walls from flexure at their hinges, a rear-chest loosely mounted on the top wall, arms on the rear-chest which may be reared toward the bottom wall and be secured thereto, and bracer-rods on said chest that may engage lower sides of the end walls to hold them erect.

2. In a folding crate, a rectangular bottom wall, a similar top wall, two side ledges thereon, two end ledges, two side walls each comprising two half-sections, hinged together, spring-hinges connecting the lower edges of the side walls with corresponding ledges on the bottom wall,

spring-hinges connecting the upper edges of the side walls with corresponding edges of the top wall, and walls, spring-hinges connecting the lower edges of said end walls with the corresponding ledges on the bottom wall, the end walls working between the side walls so as to keep the side walls erect, a rear-chest on the top wall having depending two bracer-rods, and two depending arms terminating in hooks, staples on the end walls or ledges and hinged thereto, said staples receiving the hooks when the crate is completely folded, and the bracer-rods which are spread from the arms extending therewith to hold the end walls erected.

697,856. EDGE-SETTING MACHINE. HENRY A. OLSENHAW, Leicester, England. Filed Nov. 14, 1902. Serial No. 34,702. (No model.)

Claim.—In a machine of the character specified a tool-holder comprising a body in which is fixed a screw in screw-threaded and projecting beyond said body so as to be locked by two nuts, said screw carrying tool-holder arms; a two-diameter spindle fitting within said screw and carrying bolts or catches which under the influence of an open spring on the narrower portion of said spindle engage close out end opposite to each other in the rim of the tool-holder body, said body having a locking-ring fitting within legs of a vibrating lever, substantially as described and set forth.

697,857. FENCE-MACHINE. LEO R. FRANK and JOHN W. GARDNER, Kankakee, Ill., assignors of one-third to WILLIAM A. FRANK, Kankakee, Ill. Filed Oct. 28, 1901. Serial No. 34,698. (No model.)

Claim.—1. In a fence-machine, the combination of the traveling frame, a series of twisting-rollers mounted in said frame, a series of dogs or pawls engaging said twisting-rollers, mechanism for operating said dogs or pawls to turn the rollers, and means for holding the dogs out of operation.

2. In a fence-machine, the combination of a rectangular traveling frame having hark to receive the horizontal wires and the stay-wires, the ratchet-wheel mounted in said frame and having hark to receive the stay-wires, the links carrying the pawls or dogs engaging the ratchet-wheel, the dogs and connecting said links to move simultaneously, and the handle for moving the rod to operate the links to engage and move the ratchet-wheel through the medium of the pawls or dogs.

3. In a fence-machine, the combination of a traveling frame, the horizontal mounting thereon, the ratchet-wheel carried by said mounting, the pawls or dogs having one end engaging the ratchet-wheel and having the other end extended, the pivoted rod having the arms for engaging said extended ends to hold the pawls out of operation, the mechanism for reciprocating said pawls or dogs when engaging the ratchet-wheel, and the detaching-pawl engaging the ratchet-wheel to prevent turning of said wheel.

697,858. VENT-GLASS VALVE FOR PUMPS. JOHN E. FRYMAN, Kansas, Mo. Filed Oct. 5, 1901. Serial No. 71,314. (No model.)

Claim.—1. A vent-closing valve, comprising a clamping-strip having a struck-up portion provided with an aperture, and a slide mounted between said struck-up portion and the body of the strip and having an aperture therein.

2. A vent-closing valve, comprising a clamping-strip having a struck-up portion provided with an aperture, and a slide mounted between said struck-up portion and the body of the strip, said slide having an aperture therein and provided with a stop.

3. A vent-closing valve comprising a tilted clamping-strip having an apertured offset portion forming a guide, an apertured packing held in the space formed by said offset, and a slide movable in the guide formed by the offset and adapted to traverse the aperture in the packing and the strip.

697,859. APPARATUS FOR LAUNCHING LIFE-BOATS FROM SHIPS. CHRISTIAN F. FRIEDMAN, Wilmington, Del. Filed June 11, 1901. Serial No. 64,678. (No model.)

Claim.—1. In boat-launching apparatus, the combination of a permanent overhead track with support, a swinging combination of arms with stay and guys, a truck as a means of transporting boats from the permanent track to the end of the swinging track, the truck having sheaves, a girth embracing the boat and meeting at a point above the boat, two thinblades, a link passing through said thinblades, launching-ropes fastened to said link passing over the sheaves of the truck, a boat having sheaves located at the bottom of the boat and over which the launching-ropes pass, and a brake controlling the position of the rope and thereby the position of the boat relatively to the truck.

2. In boat-launching apparatus, the combination of a permanent overhead track carrying a number of boats ready for launching, the truck having a swinging combination, said boats having eyes at the bow, and clips on the deck of the ship, the boats being kept from moving by a rope-lashing through said eyes and clips.

3. In boat-launching apparatus, the combination of a permanent overhead track, a swinging truck or beam having a depression at the end to prevent the truck going back when the ship rolls, a top stay supporting the beam, a hinge-joint between permanent and swinging beams, a strap at the end of the permanent beam supporting the end of the swinging truck, and side guys for regulating the angle of the swinging truck and for steadying the same.

4. In boat-launching apparatus, the combination of a permanent track, a swinging truck, a truck resting on the same and carrying boats suspended by hangers, said ropes fastened to the boats by a notch in the stem and stem, guided by blocks forming open eyes at the sides of the beam, whereby the hangers can easily be dropped when not wanted and securely holding the boat when the latter is resting in the hanger.

5. In a boat hoisting and conveying apparatus, a track, a pair of

beams one located at each end of the track, a pin supporting the beams, and means for swinging the beams to any position relative to the track, stays for guiding and supporting said beams, a truck adapted to run over said track and out on said beams, a pair of sheaves carried by said truck, ropes passing over said sheaves, girths fastened to said ropes, and a boat having hooks and notches for holding and fastening said girths, whereby the boat may be pushed out and dropped or lowered.

697,860. FRUIT-GRADING MACHINE. ANDREW E. PETER, Grimsby, Canada. Filed Nov. 27, 1901. Serial No. 65,004. (No model.)

Claim.—1. A fruit-grading machine comprising a horizontal apron suitably supported and having a series of openings of graded size, cross-rollers beneath said apron, and means whereby said cross-rollers frictionally rotate by the apron so as to cause them to travel continuously and successively the full length of the apron and in contact with the under surface thereof and with the fruit in the openings, substantially as described.

2. A fruit-grading machine comprising a stationary apron held in a suitable frame and having a series of sections of openings of graded size and a series of rollers suitably supported and frictionally contacting with the belt whereby they are rotated in opposite directions to that in which they are carried longitudinally so as and for the purpose specified.

3. The combination with the stationary apron suitably held at the end on the frame of the machine and provided with a series of sections of openings of graded size extending crosswise of the apron, of the endless chains provided with suitable bearings and rollers journaled in each bearing and designed to come in frictional contact with the apron, so as to cause them to rotate in the opposite direction to that in which the rollers are carried longitudinally so as and for the purpose specified.

4. The combination with the stationary apron suitably held at the end on the frame of the machine and provided with a series of sections of openings of graded size extending crosswise of the apron, of the endless chains provided with suitable bearings and rollers journaled in each bearing and designed to come in frictional contact with the apron, so as to cause them to rotate in the opposite direction to that in which the rollers are carried longitudinally and rollers for supporting the upper portion of the chain immediately underneath the apron so as and for the purpose specified.

5. The combination with the stationary apron suitably held at the end on the frame of the machine and provided with a series of sections of openings of graded size extending crosswise of the apron, of the endless chains provided with suitable bearings and rollers journaled in each bearing and designed to come in frictional contact with the apron, so as to cause them to rotate in the opposite direction to that in which the rollers

are carried longitudinally and a feed-hopper provided with an adjustable slide immediately above the feed end of the apron and a slatted feed-board whereby the surplus dirt is removed as and for the purpose specified.

6. The combination with the stationary apron suitably held at the end on the frame of the machine and provided with a series of motions of openings of graded size extending crosswise of the apron, of the endless chains provided with suitable bearings and rollers journaled in such bearings and designed to come in frictional contact with the apron, as to cause them to rotate in the opposite direction to that in which the rollers are carried longitudinally and the bias or hopper extending underneath each section of openings comprising the different grades, each bias being suitably padded as and for the purpose specified.

697,861. HANTLE FOR INCANDESCENT BURNERS. BARRY J. PHILLIPS, New York, N. Y., and VERNER H. SHANK, Philadelphia, Pa. Original application filed Oct. 12, 1900, Serial No. 698,397. Divided and this application filed July 23, 1901. Serial No. 69,268. (No model.)

Claim.—1. An incandescent element for a light consisting of a ring or eyelet, and a sheet of incandescent fabric or material surrounding the exterior of the ring and having its edges overlapped to form a tube, and a cord or wire for securing the sheet to place on the ring, substantially as described.

2. An incandescent element for gas-light consisting of a ring or eyelet and a sheet of incandescent fabric or material surrounding the exterior of the ring and having its edges overlapped to form a tube, a cord or wire for securing the sheet to place on the ring, and a ball attached to said cord or wire, substantially as described.

697,862. LIFE-PRESERVER. HENRY FAY, Montreal, Canada, assignor to Henry Fay, Ltd., Montreal, Province of Quebec, Canada. Filed July 1, 1901. Serial No. 69,269. (No model.)

Claim.—1. In an instantaneous inflating device for life-boats and the like, the combination with a collapsible bag, of a gas-generating auxiliary casing having a hopper with an inner receptacle designed to hold one of the constituents of a chemical gas, and a passage-way leading outside the bag, means for retaining one of said contents in the said inner receptacle, and for releasing the same, and suitable connections to the bag to be inflated, as and for the purpose specified.

2. The combination with a collapsible bag of an auxiliary gas-generating collapsible casing having an inner receptacle extending laterally from the neck thereof, a gas-supply pipe in proximity to the inner receptacle and leading to the collapsible bag to be filled, and means for opening the inner receptacle and the mouth of the gas-supply pipe simultaneously, as and for the purpose specified.

3. The combination with a collapsible bag, of a substantially cylindrical inner receptacle having a removable bottom, a threaded spindle controlling the bottom and inserted through an orifice and stuffing-box on the top end of the receptacle, a gas-supply pipe in proximity to the receptacle above and having its mouth open or closed through the action of the said spindle simultaneously with the removable bottom, an auxiliary gas-generating collapsible casing converging to a comparatively small neck where it fits on to the cylindrical inner receptacle, and suitable connections from the gas-supply pipe to the bag to be inflated, as and for the purpose specified.

4. The combination with a collapsible bag, of an inner receptacle, a removable bottom therefor, suitably facing on the inside of said bottom, a rod suitably connected to the bottom and controlling its upward and downward movement from the top end of the receptacle, an auxiliary gas-generating collapsible casing fitted around the neck of the receptacle, and suitable connections between a passage for the gas from the auxiliary casing and the bag to be filled, as and for the purpose specified.

5. The combination with a collapsible bag, of an inner receptacle having a cylindrical chamber, and a passage to one side thereof, and a threaded spindle controlled by a suitable thumb-screw where it protrudes through the top end of the receptacle and designed to close both chamber and passage-way simultaneously, an auxiliary gas-generating collapsible casing surrounding the lower portion of the said receptacle, an outlet with suitable connections from the said passage to the collapsible bag to be filled, as and for the purpose specified.

697,868. VENTILATOR. IRVING S. BARNES, Pueblo, Mexico. Filed Sept. 4, 1901. Serial No. 74,521. (No model.)

Claim.—1. The combination of two tube-sections, means connecting the sections together but holding them spaced from each other, a thin plate mounted loosely on the sections and extending between their adjacent ends, said thin plate having a discharge-orifice, an absorbent material arranged in the upper tube-section, a liquid-containing cup at the top thereof, and a drip-cup at the lower tube-section.

2. The combination of two tube-sections, means connecting the sections together but holding them spaced from each other, a thin plate mounted loosely on the sections and extending between their adjacent ends, said thin plate having a discharge-orifice, an absorbent material arranged in the upper tube-section, a liquid-containing cup at the top thereof, a drip-cup in the lower tube-section, and an orifice wind-break arranged above the drip-cup and below the discharge-orifice of the thin plate.

3. The combination of two tube-sections, means connecting the sections together but holding them spaced from each other, a thin plate mounted loosely on the sections and extending between their adjacent ends, said thin plate having a discharge-orifice, an absorbent material arranged in the upper tube-section, a drip-cup in the lower tube-section, an orifice wind-break arranged above the drip-cup and below the discharge-orifice of the thin plate, and a cup at the top of the upper tube-section, the upper ends

of the absorbent material being turned over the upper end of the upper tube-section and dipped into the cup, each cup serving to receive the primary supply of liquid.

697,864. TANK-LUG. JOHN BARNES, Boston, Wm. Filed Jan. 8, 1902. Serial No. 69,264. (No model.)

Claim.—1. The coupling-lug formed in one piece and composed essentially of the two side walls forming the two elongated bearing edges and connected at the ends by the two outwardly-deflected bridge-pieces, and between said bridge-pieces connected by the transverse inwardly-deflected web, each bridge-piece forming a high arch and a low arch, and said web forming two depressed inclined ends, having their lower edges located between the side walls and close to the tank-surface, when the lug is applied, the lug open below said bridge-pieces and above said web, substantially as described.

2. The coupling-lug formed in one piece and composed of the two side walls, the lower longitudinal edges of which form the bearing-surfaces of the lug against the tank-surface, the two end bridge-pieces between said walls, each bridge-piece composed of a low entrance-arch and a high abutment-arch with the intervening-flange, and the transverse web between said walls forming two oppositely-inclined ends and the intervening longitudinal rib at its ends connecting said flanges of said bridge-pieces, said lug open below the bridge-pieces and above said web, substantially as described.

3. The coupling-lug composed of the side walls having the elongated lower bearing-surfaces, said walls connected at their ends by the outwardly-arched bridge-pieces and between said bridge-pieces connected by the inwardly-deflected web having the low or depressed ends, said lug open below the bridge-pieces and above the web, substantially as described.

697,865. TRACE HOLDER AND CASE-OFF. CHARLES J. REYNOLDS, Boston, Mass., assignor of two-thirds to RAYMOND M. WOOD, Boston, Mass., and Benjamin F. Frost, Boston, Mass. Filed May 14, 1901. Serial No. 69,212. (No model.)

Claim.—1. A whiffletree having at its end a stud to enter a hole in a trace, a case-off composed of a sliding bar mounted upon the whiffletree, said bar being provided at its outer end with a fork to embrace a trace, the arms of said fork having holes to embrace the stud, a pivoted actuating device provided with a die eccentric to the pivot thereof, a stud on said sliding bar the walls of said die being arranged to engage said stud to positively move the sliding bar lengthwise of the whiffletree in either direction.

2. A whiffletree having at its end a stud to enter a hole in a trace, a case-off composed of a sliding bar mounted upon the whiffletree, and having trans-engaging means, a pivoted actuating device provided with a die eccentric to the pivot thereof, a stud on said sliding bar the walls of said die being arranged to engage said stud to positively move the sliding bar lengthwise of the whiffletree in either direction, and a locking device to lock the actuator in position to hold the trace upon the stud.

3. A whiffletree having at its end a stud to enter a hole in a trace, a sliding bar mounted upon the whiffletree and provided with means to embrace a trace, a pivoted actuating device provided with a die eccentric to the pivot thereof and having a recess at one end of the die and a cam adjacent said recess, said bar being provided with a stud to engage the eccentric die, and adapted to be moved by the said cam to cause the stud to be locked in the recess.

697,866. VALVE-CLAMP. GEORGE L. SHAW, Grand Rapids, Mich. Filed Oct. 21, 1901. Serial No. 70,000. (No model.)

Claim.—1. The combination with a vacuum-pan, of a transverse tube supported in the lower part thereof, a second tube passing through the wall of the pan and threaded into said first tube, a steam-pipe passed in the second tube and extending through the latter and into the first tube, said steam-pipe having separable sections which are united by couplings and said pipe being withdrawable from the pan through the second tube, a series of heating-tubes, branch pipes united by the couplings to the steam-pipe, and an exhaust-pipe communicating with the first tube.

2. In combination with a vacuum-pan having an outlet at its base, of a discharge-chamber having an upwardly-extending closed neck slightly fitted in said outlet and curving as a valve in closure therefor and provided with an aperture in its side, and means for raising and lowering said chamber, whereby said neck acts as a valve for opening and closing said outlet.

3. A vacuum-pan provided with a series of laterally-extending louvers having dovetail grooves therein, and a series of tubes supported thereby and having ribs engaging said grooves.

4. The combination with a vacuum-pan having an outlet at its base, of a discharge-chamber provided with an upwardly-extending neck, said neck of the chamber being slightly fitted in said outlet and adapted to serve as a means for breaking up crust therein and as a valve closure for said vacuum-pan, and means for raising said chamber.

5. The combination with a vacuum-pan having an outlet, of a discharge-chamber, means for extending from said discharge-chamber into said outlet and adapted to serve as a crust-breaker for matter which may solidify across the discharge-opening, and means for imparting movement to the crust-breaking means relative to the vacuum-pan.

697,867. SNAP-HOOK. GEORGE W. H. SHAW, Grand Rapids, Mich. Filed Nov. 1, 1901. Serial No. 69,213. (No model.)

Claim.—A snap-hook, comprising a hook proper, a tubular shank to which the hook is joined, a pin sliding in the tubular shank to meet the bill of the hook, the shank having a longitudinal slot therein, a stud carried by the pin and projected through the slot, and a shield fastened to the stud and embracing the major part of the shank, said shield extending longitudinally with the shank and being curved down around the sides thereof, and the shield moving with the pin toward and from the bill.

697,868. WAREHOUSE-PAINTER. JOHN W. SHAW, Grand Rapids, Mich. Filed Aug. 7, 1901. Serial No. 71,104. (No model.)

Claim.—1. A fastening device for a packing-ring or washer, comprising a segmental strip of metal having outwardly-turned ends designed to pass through the packing-ring or washer from the inner to the outer side and projecting beyond the outer side, substantially as specified.

2. The combination with a washer having a channel formed in its interior surface, of a fastener comprising a strip of resilient metal having a segmental body portion terminating in outwardly-extended ends, the said body portion being designed to be inserted in the channel of the washer, substantially as specified.

3. The combination with a washer having an annularly-disposed channel formed in its inner wall, of a fastener having a body portion adapted to be seated in said channel, a coil arranged in said body portion, and ends extended outward from the body portion and designed to pass through the washer material.

4. In combination with a washer, a fastener consisting of a strip of metal arranged wholly within the washer and having its ends turned outward and passed through the washer, substantially as specified.

5. In combination with a washer, a fastener consisting of a segmental strip of resilient metal embraced wholly within the circumference of the washer and having outwardly-turned ends projecting from the outside thereof, substantially as specified.

697,869. HOOD OF AND MEANS FOR VENTILATING AND FLUSHING HOUSE-DRAINS OR OTHER DRAINS AND SEWERS.
MAAS SMITH and EDWIN ARIZ, Westminster, London, England. Filed Aug. 8, 1901. Serial No. 71,499. (No model.)

Claim.—1. In a drain and cover system, a power-driven device for drawing air into and through the system, an air-exhaust shaft, a plurality of air-inlet valves provided with means for regulating the inlet-opening for the purpose stated, and a safety-valve loaded so as to open when a predetermined maximum pressure has been produced in the system, for the purpose of preventing the flooding of inspection or other traps.

2. The drain from the house, in combination with the inspection trap and chamber, the drain therefrom to the cover, a rising branch from said drain, an air-inlet valve with means for regulating the inlet for the purpose stated, the loaded safety-valve for the purpose stated, the fan, an inspection-chamber, and a valved air-inlet-throat, substantially as set forth.

3. The drain from the house in combination with the inspection trap and chamber, the drain therefrom to the cover, a rising branch in the inspection-chamber, from said drain, a box thereon with a diaphragm valve and inlet with ferrule of adjustable diameter and with a loaded safety-valve, an air-inlet hood with gauge screen, a diaphragm valve opening into the inspection-chamber and a fan substantially as set forth.

4. The soil-pipe from the house in combination with a flushing-ejector tank with siphon device and trapped outlet therefrom, the rising cubic contents of said tank several times larger than that of a water-closet flushing charge, a ventilating-pipe carried up a suitable height from the tank, and inspection-chamber with trapped drain to the cover, a rising branch from the said drain, the air-inlet valve with means for regulating the inlet for the purpose stated, the loaded safety-valve, the valved air-inlet to the inspection-chamber, and the fan substantially as set forth.

5. The soil-pipe from the house in combination with a flushing-ejector tank of the size specified, with siphon device and trapped outlet therefrom, and inspection-chamber wherein said tank is placed, a ventilating-pipe carried up from the tank, the drain, from the tank to the cover, a branch pipe in the inspection-chamber and rising from the said drain, the air-inlet valve with means for regulating the inlet for the purpose stated the loaded safety-valve, the valved air-inlet to the inspection-chamber and the fan substantially as set forth.

6. The drain from the house in combination with the inspection-trap, the drain therefrom to the cover a rising branch from said drain, and air-inlet valve provided with means for regulating the inlet for the purpose stated, the fan, an air-inlet hood with gauge screen and a light valve for admitting air from the hood to the house side of the inspection-trap, substantially as set forth.

7. In a drain and cover system, a power-driven device for drawing air into and through the system, an air-exhaust shaft, a plurality of air-inlet devices each consisting of a box fitted with a light air-inlet valve of a diaphragm form, a ferrule for regulating the inlet-opening thereto, and a safety-valve, substantially as set forth.

8. An air-inlet device, consisting of a box having two compartments and applied in connection with an inspection-trap, one of said compartments fitted with a light air-inlet valve of a diaphragm form for admitting air to the cover side of the trap, a ferrule for regulating the inlet-opening to said valve, and a safety-valve; and the other compartment fitted with a light balanced air-inlet valve of diaphragm form for admitting air to the below or house side of the trap, substantially as set forth.

697,870. PROCESS OF TREATING COPPER-NICKEL-SULFIDE ORES. DANIEL P. SULLIVAN, Sudbury, Canada. Filed Aug. 14, 1900. Serial No. 24,451. (No specimens.)

Claim.—1. The herein-described process of treating ores of the class described, that is, ores containing nickel-iron sulfide with copper-iron sulfide, which consists in subjecting the comminuted ore to magnetic separation so as to produce therefrom headings and tailings, the headings being richer in iron and sulfur than the tailings, but generally poorer in nickel; then bringing about, by the magnetic separation, a variation or readjustment of the relative proportions of iron and nickel, so as to produce the proportions which are proper for the making of nickel-steel, then roasting the headings, and finally smelting them to produce pig-iron containing a proportion of nickel which makes it suitable for the direct manufacture of nickel-steel.

2. The herein-described process of treating ores of the class described, that is, ores containing nickel-iron sulfide with copper-iron sulfide which consists in subjecting the comminuted ore to magnetic separation so as to produce therefrom headings and tailings, the headings being richer in iron and sulfur than the tailings, but generally poorer in nickel; then bringing about, by the magnetic separation, a variation or readjustment of the relative proportions of iron and nickel, so as to produce the proportions which are proper for the making of nickel-steel and then smelting the headings to produce pig-iron containing a proportion of nickel which makes it suitable for the direct manufacture of nickel-steel.

3. The herein-described process of treating ores of the class described, that is, ores containing nickel-iron sulfide with copper-iron sulfide which consists in subjecting the comminuted ore to magnetic separation so as to produce therefrom headings and tailings, the headings being richer in iron and sulfur than the tailings, but generally poorer in nickel; then bringing about, by the magnetic separation, a variation or readjustment of the relative proportions of iron and nickel, so as to produce the proportions which are proper for the making of nickel-steel, then roasting the headings, and finally smelting them with the addition of Bessemer iron ore, to produce pig-iron containing a proportion of nickel which makes it suitable for the direct manufacture of nickel-steel.

4. The herein-described process of treating ores of the class described, that is, ores containing nickel-iron sulfide with copper-iron sulfide which consists in subjecting the comminuted ore to magnetic separation so as to produce therefrom headings and tailings, the headings being richer in iron and sulfur than the tailings, but generally poorer in nickel; then bringing about, by the magnetic separation, a variation or readjustment of the relative proportions of iron and nickel, so as to produce the proportions which are proper for the making of nickel-steel, and then smelting the headings, with the addition of Bessemer iron ore, to produce pig-iron containing a proportion of nickel which makes it suitable for the direct manufacture of nickel-steel.

697,871. JAR-CLOSURE. WILLIAM SHEDDEN, Mobile, Ala. Filed Nov. 6, 1901. Serial No. 61,942. (No model.)

Claim.—1. In a jar-closure, the combination with a jar having its upper and ribbed or set away to form a contracted neck, the inner member

face of said neck or of the upper end of said jar being provided with a plurality of L-shaped grooves, one portion of each of which extends from the upper edge of said neck downwardly, and the other portion of which has its upper wall lying at an angle to the plane of the upper edge of said neck, of a lid or cover made in a single piece, having a central stopper which fits closely the inner surface of said neck and is provided with outwardly-extending integral lugs adapted to fit within said grooves, the said lid or cover being further provided with an overhanging flange or rim forming an annular groove around said stopper, and a packing-ring in said groove, the upper end of said neck adapted to fit within said groove and said rim or flange adapted to fit within the rabbeted portion of said jar and to surround the contracted neck thereof, as and for the purpose set forth.

2. In a jar-closure, the combination with a jar having its upper end rabbeted or cut away to form a contracted neck and a shoulder adjacent thereto, the inner surface of said neck or of the upper end of said jar being provided with a plurality of L-shaped grooves, one portion of each of which extends from the upper edge of said neck downwardly and the other portion of which has its upper wall lying at an angle to the plane of the upper edge of said neck, of a lid or cover made in a single piece having a central stopper which fits closely the inner surface of said neck and is provided with outwardly-extending integral lugs adapted to fit within said grooves, the said lid or cover being further provided with an overhanging flange or rim forming an annular groove around said stopper, and a packing-ring in said groove, the upper end of said neck adapted to fit within said groove and said rim or flange adapted to fit within the rabbeted portion of said jar, to surround said contracted neck and to engage said shoulder, the outer surface of said rim or flange lying flush with the outer surface of said jar.

697,873. CHAIR. ADOLPH H. SMITH, Superior, Wis. Filed May 4, 1901. Serial No. 54,941. (No Model.)

Claim.—1. A chair having arms with portions extended rearward of the chair-back, the said arms being provided with longitudinal channels opening outward at the rear end of the arms and closed at the front end, and slots opening outward from the channels, blocks movable in said channels, posts extended from the blocks through the slots, and a back-rest adapted to be supported by the posts, substantially as specified.

2. A chair having arms and a back, the side bars of said back being provided with notches, a recess or opening in the back, a swinging section for closing said recess or opening, a back-rest adapted to be placed in said recess or opening, a rod on the back-rest for passing into said notches, and means for supporting the back-rest on the arms of the chair, substantially as specified.

697,878. GAS-MAKING APPARATUS. HENRY SWANSON, Elyria, Ohio. Filed Oct. 2, 1903. Serial No. 21,503. (No Model.)

Claim.—1. In a gas-making stove or furnace, the combination with a fire-box and a retort, of a pipe connected with the retort, and means heated within the pipe for straining and refining the gas as it passes therethrough, the refining-pipe being elevated above the retort and arranged to allow the liquid strained out of the gas in the refining-pipe, to flow back into the retort, to be converted into gas.

2. In a gas-making apparatus, the combination with a fire-box and retort, of a pipe heated above the retort and connected therewith, said

pipe being provided with a series of strainers for purifying the gas, the strainer-pipe being arranged to allow the liquid which is separated from the gas during the refining operation, to flow back into the retort.

3. In a gas-making apparatus, the combination with the fire-box and retort, of a coil of pipe arranged above the retort and containing a series of wire-gauze strainers, the said coil being connected with the retort to allow the gas resulting from the destructive distillation of the coal therein, to pass to the coil, the arrangement being such that the liquid separated from the gas during the straining operation, flows back into the retort.

4. In a gas-making apparatus the combination with a retort, of a pipe connected with the retort, and a series of strainers located within the pipe for straining and refining the gas as it passes therethrough.

5. In a gas-making apparatus the combination with a retort, of a pipe connected with the retort, a series of strainers located within the pipe for straining and refining the gas as it passes therethrough, and means connected with the refining-pipe to allow the liquid resulting from the refining operation, to escape therefrom for gas-making or other purposes.

697,874. POWDER-DISTRIBUTER. JAMES A. STUART, Quincy, and BERT F. UPHAM, Boston, Mass. Filed Oct. 26, 1903. Serial No. 24,502. (No Model.)

Claim.—1. In a means for preventing offsetting, a powder-receptacle constructed to receive a current of air, and a tube constructed to conduct the dust-laden air from said receptacle and direct the same upon the surface to be protected, substantially as described.

2. In a means for preventing offsetting, the combination with the traveling tapes for conveying freshly-printed sheets, of a tube constructed to receive a dust-laden current of air and provided with outlets discharging the dust-laden air upon said tapes, substantially as described.

3. In a means for preventing offsetting, the combination with the traveling tapes for conveying freshly-printed sheets, of a tube receiving a dust-laden current of air, a plurality of branches opening from said tube, one for each tape, and a valve for each branch, substantially as described.

4. In a means for preventing offsetting, the combination with the traveling tapes for conveying freshly-printed sheets, of a tube constructed to receive a dust-laden current of air, branches from said tube, one for each tape, the tube extension or return, and the receiver at the end of said return, substantially as described.

5. The combination with the tube receiving dust-laden air, of the

brush constructed to receive the said air and discharge it from between the bristles thereof, substantially as described.

6. In a means for preventing offsetting, the combination with the traveling tapes for conveying freshly-printed sheets, of a brush for each tape constructed with a hollow head receiving a dust-laden air and delivering the same between the bristles thereof, substantially as described.

7. In a means for preventing offsetting, the combination with ink-receiving surfaces, of means for directing a dust-laden current of air thereon, substantially as described.

8. The combination with a means for supplying a dust-laden current of air, of a tube for receiving the same, a plurality of flexible branches leading from said tube, a dust-receiver at the outer end of said tube, and means for giving a back pressure to the said outer end, substantially as described.

9. In a powder-distributor, the combination of the air-tight powder-receptacle, the tube delivering an air-current near the bottom of said receptacle, the tube opening at one end through the top of said receptacle, the plurality of branches opening from said tube and having each a valve, the tube extension or return, and the receiver at the end of said return, substantially as described.

697,875. SHAP-SEAL. EDWARD J. BROWN, East Orange, N. J.
Filed Feb. 18, 1908. Serial No. 94,082. (No model.)

Claim.—1. An improved snap-earl composed of a flexible sheet metal shank having withdrawal-resisting snap-catches at its respective ends, projecting from its face and its back respectively, an oppositely-projecting supplemental snap-earl between one of said catches and its extremity of the shank and a catch-hole between the other of the catches first named and its extremity of the shank adapted to interlock with said supplemental snap-earl, and a hollow sheet-metal earl part having an inlet for the shank ends, a chamber in communication with said inlet adapted to accommodate said shank ends within it, and recesses in the respective sides of said chamber adapted to interlock with said catches first named and to mask the free end of said supplemental snap-earl.

2. The combination, in a snap-earl, of a flexible sheet-metal shank having withdrawal-resisting snap-catches at its respective ends, and a hollow sheet-metal earl part composed of a pair of body-pieces and a disk-shaped inlet-forming piece interlocked with each other and adapted to inclose said shank ends and to interlock with said snap-catches respectively.

3. The combination, in a snap-earl, of a flexible sheet-metal shank having withdrawal-resisting snap-catches at its respective ends, covered from the body of the shank at one end and projecting from its face and from its back respectively, and a hollow sheet-metal earl part composed of a pair of body-pieces and a disk-shaped inlet-forming piece interlocked with each other and having a chamber, in communication with the inlet, provided with a catch-recess in one side adapted to interlock successively with both of said snap-catches.

4. The combination, in a snap-earl, of a flexible sheet-metal shank having withdrawal-resisting snap-catches at its respective ends, covered from the body of the shank at one end and projecting from its face and from its back respectively, an oppositely-projecting supplemental snap-earl between one of said catches and its extremity of the shank and a catch-hole, between the other of the catches first named and its extremity of the shank, adapted to interlock with said supplemental snap-earl, and a hollow sheet-metal earl part composed of a pair of body-pieces and a disk-shaped inlet-forming piece, interlocked with each other and adapted to inclose said shank ends and to interlock with said catches first named.

5. The combination, in a snap-earl, of a flexible sheet-metal shank having withdrawal-resisting snap-catches at its respective ends, covered from the body of the shank at one end and projecting from its face and from its back respectively, an oppositely-projecting supplemental snap-earl between one of said catches and its extremity of the shank and a catch-hole, between the other of the catches first named and its extremity of the shank, adapted to interlock with said supplemental snap-earl, and a hollow sheet-metal earl part composed of a pair of body-pieces provided respectively with a recess adapted to interlock with said catches

first named and a recess to mask the free end of said supplemental snap-earl, and a disk-shaped inlet-forming piece interlocked with said body-pieces, substantially as hereinbefore specified.

697,876. MECHANICAL DIRECTORY. GEORGE W. HAYWELL, Los Angeles, Cal. Filed Nov. 20, 1906. Serial No. 737,000. (No model.)

Claim.—1. A directory comprising a directory-strip having alphabetically-arranged lists of individual names; an index device with letters of the alphabet arranged thereon to correspond with said lists and at distances apart less than and proportionate to the spaces occupied by the directory-lists under the corresponding letters of the alphabet, respectively; and automatic reversible means for simultaneously operating said directory-strip and said index device continuously throughout the full extent of their lists at speeds proportionate with their respective spacings in one and the other direction, alternately.

2. A directory comprising a main directory-strip having alphabetically-arranged lists of individual names; an index-strip with letters of the alphabet arranged thereon to correspond with said lists and at distances apart less than and proportionate to the spaces occupied by the directory-lists under the corresponding letters of the alphabet, respectively; and automatic reversible means for simultaneously operating the directory-strip and the index-strip continuously throughout the full extent of their lists at speeds proportionate with their respective spacings, and in one and the other direction, alternately.

3. A directory comprising a directory-strip having alphabetically-arranged lists of individual names; a supplemental directory-strip having a less number of individual names than the main strip, the same being alphabetically arranged and relatively spaced to correspond with the main strip on a shorter scale; and automatic reversible means for simultaneously operating the said strips continuously throughout the full extent of their lists in either direction at speeds proportionate to their respective spacings, and in one and the other direction, alternately.

4. The combination of two rollers mounted parallel with each other; a flexible strip connected at one end with one of the rollers and at the other end with the other roller to be wound and unwound from roller to roller; wheels for said rollers, respectively; wheels for driving said rollers, respectively; a lever carrying said driving-wheels and pivoted to simultaneously hold one of the driving-wheels in operative engagement with its roller-wheel and the other driving-wheel out of engagement with its roller-wheel, and vice versa; a master-wheel journaled to revolve and operatively engaging with said driving-wheels and being frictionally connected with the lever to throw the lever in the direction of the rotation of the master-wheel; and means for rotating the master-wheel.

5. The combination of two rollers mounted parallel with each other; a master-wheel; a flexible strip connected at one end with one of the rollers and at the other end with the other roller, to be wound and unwound from roller to roller; wheels for said rollers, respectively; a lever comprising two spring-bases journaled on the shaft of the master-wheel on opposite sides of said master-wheel, and contacting with the hub of the master-wheel; arms between said bases at the ends thereof, respectively; said bases being sprung friction-tight against the hub of the master-wheel; wheels for driving said roller-wheels, respectively, journaled on said arms and meshing with the master-wheel; and means for rotating the master-wheel.

6. A directory comprising a main directory-strip having alphabetically-arranged lists of individual names and addresses; a set of rollers for operating said directory-strip; an index-strip; a set of rollers for operating the index-strip; small gear-wheel, respectively, on the rollers of

the main strip; larger sprocket-wheel, respectively, on the rollers of the index-strip; a sprocket-chain operatively connecting one of the small sprocket-wheels with one of the large sprocket-wheels; a sprocket-chain operatively connecting the other small sprocket-wheel with the other large sprocket-wheel; and automatic reversible means for driving the rollers of one of said sets of rollers continuously in the full extent of said list in one and the other direction, alternately.

7. The combination of two main rollers mounted parallel with each other; a master-wheel; a flexible strip connected at one end with one of the rollers and at the other end with the other roller to be wound and unwound from roller to roller; wheels for said rollers, respectively, at one side of the machine; small sprocket-wheels fastened to the main roller-shafts, respectively, at the other side of the machine; a plurality of sets of supplemental rollers; flexible supplemental strips, one for each set of supplemental rollers, each supplemental strip being connected at its ends respectively with the rollers of its set to be wound and unwound from roller to roller; large sprocket-wheels on the ends of the supplemental rollers at the same side of the machine with said small sprocket-wheels; sprocket-chains connecting the sprocket-wheels of one of the main rollers with one sprocket-wheel, respectively, of each of the sets of supplemental rollers; sprocket-chains connecting the sprocket-wheel of the other main roller with the other sprocket-wheel of the respective sets of supplemental rollers; wheels for driving said main roller-wheels respectively; a lever carrying said driving-wheels and pivoted to simultaneously hold one of the driving-wheels in operative engagement with its roller-wheel and the other driving-wheel out of engagement with its roller-wheel, and vice versa; a master-wheel journaled to revolve and operatively engaging with said driving-wheels and being frictionally connected with the lever to throw the lever in the direction of the rotation of the master-wheel; and means for rotating the master-wheel.

8. A directory comprising a directory-strip having alphabetically-arranged lists of individual names; an index device with letters of the alphabet arranged thereon to correspond with said lists and at distances apart less than and proportionate to the spaces occupied by the directory-lists under the corresponding letters of the alphabet, respectively; and automatic reversible means for simultaneously operating the directory-strip and index device at speeds proportionate with their respective spacings in one and the other direction, alternately.

9. A directory comprising a main directory-strip having alphabetically-arranged lists of individual names; an index-strip with letters of the alphabet arranged thereon to correspond with said lists and at distances apart less than and proportionate to the spaces occupied by the directory-lists under the corresponding letters of the alphabet, respectively; and automatic reversible means for simultaneously operating the directory-strip and the index-strip at speeds proportionate with their respective spacings, and in one and the other direction, alternately.

10. A directory comprising a directory-strip having alphabetically-arranged lists of individual names; a supplemental directory-strip having a less number of individual names than the main strip, the same being alphabetically arranged and relatively spaced to correspond with the main strip on a shorter scale; and automatic reversible means for simultaneously operating the said strips in either direction at speeds proportionate to their respective spacings, and in one and the other direction, alternately.

11. A directory comprising two rollers mounted parallel with each other; a flexible strip connected at one end with one of the rollers and at the other end with the other roller, to be wound and unwound from roller to roller; wheels for said rollers respectively; wheels for driving said roller-wheels respectively; a lever carrying said driving-wheels and pivoted to simultaneously hold one of the driving-wheels in operative engagement with its roller-wheel, and the other driving-wheel out of engagement with its roller-wheel, and vice versa; a master-wheel journaled to revolve centrally of the pivot of the lever; and means for rotating the master-wheel.

12. The combination of the frame with supplement extension; main ribbon-roller and idler in the frame; a directory-ribbon on said roller and idler; a supplement directory-ribbon in the supplement extension; ribbon-roller and idler for said supplement-ribbon; a driving-shaft; means for turning said shaft; a master-wheel driven by said shaft; a lever journaled coaxial with the master-wheel, two pinions, one at each end of the lever, and which pinions mesh with and are driven by the master-wheel; a cog-wheel fastened to one of the main rollers; a cog-wheel fastened to the other main roller; a frictional device fixed to the lever and engaging the master-wheel to cause the rotation of the master-wheel to shift the lever to mesh a transmitting-pinion with one or the other roller cog-wheel; and means operatively connecting one of the main rollers with one of the supplement-rollers.

13. A directory comprising a main directory-ribbon and a supplement directory-ribbon; main directory-roller; supplement directory-ribbon roller; cog-wheels fastened to the main directory-ribbon roller; a

driving-shaft; means for turning the shaft; a master-wheel on the shaft and driven by the driving-shaft; a lever journaled coaxial with the master-wheel and provided at each end with a transmitting-pinion, said pinions meshing with and driven by said master-wheel to independently mesh with the cog-wheels of the respective rollers when the lever is vibrated in one or the other direction; frictional means being provided to cause the rotation of the master-wheel to shift the lever to mesh a transmitting-pinion with one or the other of the roller cog-wheels; a sprocket-wheel fixed to one of the main rollers; a sprocket-wheel fixed to one of the supplement-rollers; a sprocket-chain connecting said sprocket-wheels, a sprocket-wheel fixed to the other supplement-roller; a sprocket-wheel fixed to the other main roller; and a sprocket-chain connecting each two sprocket-wheels.

14. The combination of a directory-strip; an index therefor; means for moving the directory-strip; means for moving the index; means operatively connecting the directory-strip-moving means and the index-moving means; a crank; and automatic reversing mechanism interposed between the crank and the directory-strip-moving means for transmitting motion from the crank to operate said means alternately in one and the other direction.

15. A mechanical directory provided with a main directory-strip; means for moving said strip; a supplemental directory-strip; means for moving said supplemental strip; operative mechanism for causing both of said strip-moving means to move simultaneously; a crank; and automatic-reversing mechanism interposed between the crank and the strip-moving means to operate the same alternately in one and the other direction.

16. In a strip-directory, strip-operating mechanism comprising two rollers mounted parallel with each other; pinions mounted on the roller-shafts; a master-wheel mounted between said rollers; a pinion-carrying lever mounted to turn on an axis coaxially of the master-wheel; pinions mounted on the ends of said lever and meshing with the master-wheel and arranged to alternately mesh, one with one of the roller-shaft pinions, and the other with the other roller-shaft pinion; and means for turning the master-wheel.

17. In a strip-directory, strip-operating mechanism comprising two rollers mounted parallel with each other; pinions mounted on the roller-shafts; a master-wheel mounted between said rollers; a pinion-carrying lever mounted to turn on the master-wheel shaft; pinions mounted on the ends of said lever and meshing with the master-wheel and adapted to alternately mesh, one with one of the roller-shaft pinions, and the other with the other roller-shaft pinion, frictional means being provided whereby the lever is thrown in the direction of the rotation of the master-wheel; and means for turning the master-wheel.

18. The combination of a plurality of pairs of rollers; a plurality of strips fastened at their opposite ends to the rollers of said pairs respectively to be wound and unwound from roller to roller of their respective pairs; means operatively connected with one roller of each of said pairs to cause said rollers to simultaneously rotate; means operatively connected with the other roller of each of said pairs to cause said other rollers to simultaneously rotate; a reversible prime mover; and automatic-shifting power-transmitting mechanism interposed between said prime mover and said roller-rotating means to drive the one and release the other of said roller-rotating means when the prime mover is operated in the one direction; and vice versa when the prime mover is operated in the other direction.

19. The combination of two rollers; a strip fastened at its ends to said rollers respectively, to be wound and unwound from roller to roller; means for driving one of said rollers; means for driving the other of said rollers; a prime mover adapted to be moved in one and the other direction; and automatic-reversing power-transmitting mechanism operated by the prime mover and interposed between said prime mover and the means for driving said rollers to operate the one of said means to drive one of said rollers and to release the other of said rollers when the prime mover is turned in one direction, and to operate the other means to drive the other roller and to release the first-named means and roller when the prime mover is turned in the other direction.

697,877. GANNET-DIRECTORY. GEORGE W. HARVEY, Los Angeles, Cal. Filed Apr. 1, 1906. Renewed Aug. 1, 1908. Serial No. 25,001. (No Model.)

Claim.—1. A directory or like information-exhibiting device comprising a reversible case provided upon its different sides with right-openings; mechanism for moving information-strip back and forth behind each right-opening; means whereby one set of strip-operating mechanism is brought into operative connection with the control operating-shaft when the case is revolved to bring any one of the right-openings into a predetermined position.

2. A directory or like information-giving device comprising the reversible case provided upon several of its sides with right-openings for dis-

playing information printed upon strips; means for moving the strips back and forth behind the sight-openings; the one mounted to receive eccentrically whereby the central shaft engages with one of and disengages from the other strip-operating mechanisms.

3. A directory or like information-exhibiting device comprising a case provided upon its different sides with sight-openings; means for passing each information back and forth behind such sight-openings; the operating-shaft; the driving-wheel mounted on such shaft; the master-wheel for operating the information-giving device; the eccentric bearings mounted in the revolvable case whereby an eccentric travel is imparted to the case to carry one set of strip-operating master-wheels out of engagement with the driving-wheel, and another set into engagement therewith.

4. In a strip-directory, two sets of strip-operating rollers mounted coaxially; means for operating each roller to wind the strip from one roller to the other roller in one of the sets of the strip-operating rollers; the pinion loosely mounted upon the ends of the coaxial roller-shafts; and means for shifting each pinion from one shaft to the other whereby one set of rollers is thrown into motion and the other set is left inoperative.

5. In a strip-directory, the two sets of strip-operating rollers mounted coaxially; a master-wheel; a pivoted lever carrying a pinion on each end; a friction device attached to the pivoted lever and bearing on the master-wheel; the pinion loosely mounted upon the coaxial roller-shafts and adapted to engage with the pinion on the pivoted lever when the lever is thrown in its direction; means for shifting the pinion from one roller-shaft to the other; and means for engaging the pinion with each shaft.

6. The combination of two rollers; a strip fastened at its ends respectively to the rollers of one pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

7. The combination of two pairs of rollers with directory-strips, one for each pair of rollers, the shafts of two of the rollers being not coaxial with each other to form a unitary arbor and the shafts of the other two rollers being not coaxial with each other to form a unitary arbor, and each roller-shaft being provided with a projection; two roller-driving cog-wheels, one mounted upon each of said arbors and each provided with lateral projections to engage the projections of the roller-shafts respectively when the roller-driving cog-wheel is shifted to one or the other of said roller-shaft projections; and means for shifting the roller-driving cog-wheels.

8. The combination of two directory-ribbon rollers; a cog-wheel fastened to one of said rollers; a cog-wheel fastened to the other roller; a driving-shaft; a master-wheel and frictional disk fixed on the driving-shaft; a lever journaled coaxially with the master-wheel and provided at each end with a transmitting-pinion, said pinions meshing with and driven by said master-wheel to independently mesh with the cog-wheels of the respective rollers when the lever is vibrated in one or the other direction; and a frictional device fixed to the lever and engaging the frictional disk on the master-wheel to cause the rotation of the master-wheel to shift the lever to mesh a transmitting-pinion with one or the other of the roller cog-wheels.

697,878. MECHANICAL DIRECTORY. GEORGE W. HAYWORTH, Los Angeles, Cal. Filed Oct. 28, 1900. Serial No. 94,979. (No model.)
Claim.—1. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its

ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

2. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

3. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

ends the other clutch when the wheel is shifted to one side, and vice versa when the wheel is shifted to the other side.

4. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

5. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

6. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

7. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

8. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

9. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

10. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; a wheel operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said wheel in one and the other direction; and means operatively connected with said wheel for simultaneously operating the clutch mechanisms to throw the one into and the other out of operation when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction.

11. In a directory, the combination with the strip-operating means, of a shaft; a master-wheel having a limited lateral and rotary movement on said shaft; means connecting said wheel with the roller-operating means; two levers for throwing said roller-operating means into and out of operative position; and means for shifting said wheel in one direction to operate said levers to throw one of said roller-operating means into and the other of said roller-operating means out of operative position when the wheel is shifted in one direction, and vice versa when the wheel is shifted in the other direction.

12. In a directory, a support; two sets of rollers journaled thereon; a directory-ribbon on each set of rollers; means for connecting the corresponding rollers of each set to rotate them in unison; clutch mechanisms connected with both rollers of one set; a bifurcated lever for each clutch; a screw-threaded cam-shaft; and a screw-threaded master-wheel mounted on said shaft and having its periphery within the bifurcation of said levers, said wheel being operatively connected with said set of rollers and adapted to be moved laterally upon its shaft when the direction of rotation of the shaft is reversed.

13. In a directory, a casing provided with four sight-openings; a master-wheel; two sets of rollers journaled in said casing; means for driving said rollers from the master-wheel; a directory-ribbon on each set of rollers, each side of each ribbon being provided with means; means for engaging a portion of each side of each ribbon through one or the other of said openings; and means for simultaneously moving said ribbons longitudinally in the same direction and automatically reversing the direction of their movement as the direction of rotation of the master-wheel is reversed.

697,879. MECHANICAL DIRECTORY. GEORGE W. HAYWORTH, Los Angeles, Cal. Filed Oct. 28, 1900. Serial No. 94,980. (No model.)

Claim.—1. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its

setting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of the one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; means for driving one of said second-named connected rollers; a clutch for connecting said means with and disconnecting it from its roller; a shaft; means operatively connecting said shaft with both of said roller-driving means for simultaneously driving them; a lever connection for connecting and disconnecting said clutches; reversibly-arranged dogs on said lever connection at opposite sides of the shaft; and tappets connected with said shaft to rotate therewith and arranged to move across the path of said dogs whereby when the shaft is rotated in one direction, said tappets operatively engage one of said dogs to operate the lever connection in one direction to connect one of said clutches and disconnect the other of said clutches, and when the shaft is rotated in the other direction said tappets will operate the other dog and throw the lever to connect the other clutch and disconnect the first-named clutch.

2. The combination of two pairs of rollers; a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of the one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; means for driving one of said second-named connected rollers; a clutch for connecting said means with and disconnecting it from its roller; a shaft; means operatively connecting said shaft with both of said roller-driving means for simultaneously driving them; a lever journaled on and pivoted to the shaft to allow the shaft to rotate in said lever and to allow the lever to vibrate on said shaft; reversely-arranged dogs on said lever; and one or more tappets connected with the shaft to rotate therewith and to move in the path of the dogs to operatively engage one of said dogs to throw the lever in one direction when the shaft is rotated in one direction and to operatively engage the other of said dogs to throw the lever in the other direction when the shaft is rotated in the other direction, said lever being operatively connected with the clutches to connect the one and disconnect the other when the shaft is thrown in one direction, and when thrown when the shaft is thrown in the other direction.

2. The combination of two pairs of rollers; a strip fed into at its ends respectively to the rollers of one pair; a strip fed into at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of the one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said

roller; means for driving one of said second-mentioned connected rollers; a clutch for connecting said means with and disconnecting it from the roller; a shaft; means operatively connecting said shaft with both of said roller-driving means for simultaneously driving them; a lever connection for connecting and disconnecting said clutches; and reversely-arranged dog and tappet mechanisms for transmitting motion from the shaft to operate said lever connection for connecting one clutch and disconnecting the other clutch when the shaft is rotated in one direction, and vice versa when the shaft is rotated in the other direction.

4. The combination of two pairs of rollers; a strip fitted at its ends respectively to the rollers of one pair; a strip fitted at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of the one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; means for driving one of said second-named connected rollers; a clutch for connecting said means with and disconnecting it from its roller; a shaft; means operatively connecting said shaft with both of said roller-driving means for simultaneously driving them; a lever journaled on and pivoted to the shaft to allow the shaft to rotate in said lever and to allow the lever to vibrate on said shaft; and reversibly-arranged dog and tappet mechanism whereby the rotation of the shaft in one direction throws the lever in one direction and the rotation of the shaft in the other direction throws the lever in the other direction, said lever being connected with the clutches to connect the one and disconnect the other when the shaft is thrown in one direction, and vice versa when the shaft is thrown in the other direction.

8. The combination of two pairs of rollers; a cone respectively to the rollers of one pair; a strip respectively to the rollers of the other pair; means for connecting one roller of one pair with one roller of the other rollers operation; means operatively connecting the pair with the other roller of the other pair for their rotation; means for driving one of said first-named conical rollers for connecting said means with and disconnecting it from said roller; means for driving one of said second-named conical rollers; a clutch connecting said means with and disconnecting it from its roller-wheel on said shaft; a sprocket-chain led around said sprocket-wheel and arranged to drive said roller-driving means; tappets on said sprocket-wheel and pivoted lever extending across said sprocket-wheel between sides of the center of said wheel with severally engaged by said tappets when said wheel is rotated in one direction is thrown in one direction when the wheel is rotated in the other direction when the wheel is rotated, said lever being operatively connected with one of the sprocket-chains and the other when the shaft is thrown in one direction, and vice versa when the shaft is thrown in the other direction.

6. The combination with the rollers and directory-strips of a mechanical directory, of means for operating said rollers to move the directory-strips in one and the other direction; an index-strip; two rollers upon which said index-strip is mounted to be wound and unwound from roller to roller; a bevel-wheel operatively connected with one of the directory-strip rollers; a worm gear-wheel operatively connected with the index-strip rollers; and a shaft furnished with a bevel-gear meshing with the bevel-gear on the directory-strip roller, and also furnished with a worm engaging the worm-gear of the index-strip roller.

7. The combination of two pairs of rollers, a strip fastened at its ends respectively to the rollers of one pair; a strip fastened at its ends respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; means for driving one of said first-named connected rollers; a clutch for connecting said means with and disconnecting it from said roller; means for driving one of said second-named connected rollers; a clutch for connecting said means with and disconnecting it from said other roller; a shaft operatively connected with both of said roller-driving means for simultaneously driving them; means for rotating said shaft in one and the other direction; a lever extending crosswise of the shaft and furnished on opposite sides of the shaft with reversely-arranged dogs and one or more tappets connected to rotate with said shaft to move across the path of said dogs to engage the same to throw the lever in one direction when the wheel is rotated in one direction, and vice versa when the wheel is rotated in the other direction; said lever being operatively connected with said clutches, for alternately connecting the one and disconnecting the other, and vice versa.

8. The combination of two pairs of rollers; a strip fastened at the ends transversely to the rollers of one pair; a strip fastened at the ends

respectively to the rollers of the other pair; means operatively connecting one roller of one pair with one roller of the other pair for their simultaneous operation; means operatively connecting the other roller of one pair with the other roller of the other pair for their simultaneous operation; a sprocket-wheel slightly mounted on one of said fixed-axled connected rollers; a clutch for connecting said idling sprocket-wheel with and disconnecting it from said roller; another sprocket-wheel slightly mounted on one of said second-axled connected rollers; a clutch for connecting said idling sprocket-wheel with and disconnecting it from said other roller; a master sprocket-wheel; a sprocket-chain interposed said sprocket-wheels and master-wheel; stops for rotating said master sprocket-wheel in one and the other direction; tappets connected with the master-wheel to rotate therewith; means for shifting the sprocket-wheels on their respective rollers to absolutely connect and disconnect their clutches; and reversely-arranged dogs on opposite sides of the axle of the master-wheel, operatively connected with the sprocket-wheel-shifting means, and arranged in the path of the tappets to be actuated by said tappets.

897,880. MECHANICAL DIRECTORY. George W. Harvill.
Los Angeles, Cal. Filed Oct. 28, 1909. Serial No. 84,081. (No model.)

China.—1. The combination of a plurality of pairs of rollers; strips for said pairs of rollers respectively, each strip having its ends fastened to the respective rollers of its pair to be wound and unwound from roller to roller; means connecting a train of rollers, which train comprises one roller of each of said pairs for the simultaneous rotation of one roller of each of said pairs; means connecting a train of rollers which comprises the other roller of each of said pairs respectively for the simultaneous rotation of the said other rollers of the several pairs; a wheel fastened with a clutch member and having a rotary and a lateral movement; means operatively connected with the first-named train to shift said wheel laterally to operatively connect it to drive said first-named train when said wheel is rotated in one direction and to disconnect said wheel from said first-named train when the wheel is rotated in the other direction; a wheel having a lateral and a rotary movement and arranged for operative connection with the second-named train; means for shifting said wheel laterally to operatively connect it to drive said second-named train when the wheel is rotated in one direction and to disconnect it from said train when the wheel is rotated in the other direction; and means operatively connected with said wheels and having a movement in one and the other direction to turn one of said wheels in one direction and the other in the other direction to drive one train and release the other, and vice versa.

2. The combination of a plurality of pairs of rollers, strips for said pairs of rollers respectively, each strip having its ends fastened to the respective rollers of its pair to be wound and unwound from roller to roller, means connecting a train of rollers, which train comprises one roller of each of said pairs for the simultaneous rotation of one roller of each of

mid pairs; means connecting a train of rollers which comprises the other rollers of each of said pairs respectively for the simultaneous rotation of the said other rollers of the several pairs; a sprocket-wheel furnished with a chain member and having a rotary and a lateral movement; means operatively connected with the first-named train to shift said sprocket-wheel laterally to operatively connect it to drive said first-named train when said sprocket-wheel is rotated in one direction and to disconnect said sprocket-wheel from said first-named train when the sprocket-wheel is rotated in the other direction; a sprocket-wheel having a lateral and a rotary movement and arranged for operative connection with the second-named train; means for shifting said sprocket-wheel laterally to operatively connect it to drive said second-named train when the sprocket-wheel is rotated in one direction and to disconnect it from said train when the sprocket-wheel is rotated in the other direction; a master sprocket-wheel; and a sprocket-chain led around said master sprocket-wheel and around said sprocket-wheels for their simultaneous rotation in one and the other direction.

11. The combination of a plurality of pairs of rollers; strips for said pairs of rollers respectively, each strip having its ends fastened to the respective rollers of its pair to be wound and unwound from roller to roller; means connecting a train of rollers, which train comprises one roller of each of said pairs for the simultaneous rotation of one roller of each of said pairs; means connecting a train of rollers which comprises the other roller of said pairs respectively for the simultaneous rotation of the said other roller of the several pairs; a shaft positively connected with one of said trains and furnished with a screw-threaded portion and with a plain portion; a wheel furnished with a nut to screw onto and off of said screw-threaded portion and to rotate freely on said unthreaded portion; resilient means to throw the wheel onto the screw-threaded portion; a clutch for connecting the wheel and the shaft for the rotation of the shaft when the nut is screwed upon the screw and to disconnect the same when the nut is upon the plain portion; a shaft connected with the other train to rotate therewith and furnished with a screw-threaded portion and a plain portion; a wheel furnished with a nut to screw upon said screw and to rotate upon said plain portion and furnished with a clutch member for connecting said wheel with said shaft when the nut is screwed upon the screw-threaded portion and disconnecting the wheel when the nut is upon the smooth portion; resilient means for holding the nut against the end of the screw; and means adapted to be turned in one and the other direction and connected with said wheels to turn one in the one direction to screw it upon the screw and the other in the other direction to unscrew it from its screw, and vice versa.

4. The combination of a plurality of pairs of rollers; strips for said pairs of rollers respectively, each strip having its ends fastened to the respective rollers of its pair to be wound and unwound from roller to roller; means connecting a train of rollers, which train comprises one roller of each of said pairs for the simultaneous rotation of one roller of each of said pairs; means connecting a train of rollers which comprises the other roller of said pairs respectively for the simultaneous rotation of the said other roller of the several pairs; a shaft operatively connected with one of said trains and furnished with a screw-threaded portion and with a plain portion; a wheel furnished with a nut to screw onto and off of said screw-threaded portion and to rotate freely on said unthreaded portion; resilient means to throw the wheel onto the screw; a clutch for connecting the wheel and the shaft for the rotation of the shaft when the nut is screwed upon the screw and to disconnect the same when the nut is upon the plain portion; a shaft connected with the other train to rotate therewith and furnished with a screw-threaded portion and a plain portion; a wheel furnished with a nut to screw upon said screw and to rotate upon said plain portion and furnished with a clutch member for connecting said wheel with said shaft when the nut is screwed upon the screw-threaded portion and disconnecting the wheel when the nut is upon the smooth portion; resilient means for holding the nut against the end of the screw; a master sprocket-wheel and a sprocket-chain led around said master sprocket-wheel and around said sprocket-wheels for their simultaneous rotation in one and the other direction.

8. The combination of a frame; a plurality of rollers arranged in two rows and in a plurality of pairs; means operatively connecting the rollers of one row in a train for their simultaneous rotation; means operatively connecting the rollers of the other row in a train for their simultaneous operation; a row of idlers arranged in front of one of said rows of rollers, and in pairs, the pairs of idlers being devoted to and arranged in front of the pairs of rollers, respectively; strips for the pairs of rollers, respectively, each strip being led in front of its respective pair of idlers and fastened at its ends respectively to the rollers of its pair; and automatic reversing means for simultaneously driving one train of rollers, and releasing the other train of rollers, and vice versa.

697,881. MINERALIAL DISTRICT. James W. Maxwell.
Los Angeles, Cal. Filed Dec. 2, 1902. About 100 claims. (No model.)

Claim.—1. In combination with a suitable casing provided with an inspection-opening, a pair of shafts mounted therein; a web or band passing from one shaft to the other; said inspection-opening; a wheel mounted in the casing intermediate the ends of said shafts; arms pivotally connected to the casing adjacent to the ends of the shafts; and rollers carried by the free ends of said arms and normally resting on the wheel, said rollers being of such size that as the wheel is rotated in one or the other direction, one or the other of said rollers will be brought into operative or driving relation with the end of the adjacent shaft.

2. In combination with a suitable casing provided with an inspection-opening, a pair of shafts mounted therein; a web or band passing from one to the other of said shafts past said inspection-opening; a wheel mounted intermediate the ends of said shafts; a slotted arm P pivotally connected to the casing adjacent to the upper shaft; a roller carried by said arm and normally resting upon the wheel; an arm pivotally connected to the casing below the wheel; a roller carried by said arm and normally held in contact with the wheel; and means for rotating the wheel, substantially as and for the purpose described.

3. In combination with a suitable casing provided with an inspection-opening, a pair of shafts mounted therein; a web extending from one to the other of said shafts past the inspection-opening; a wheel mounted intermediate the shafts; a slotted arm P pivotally connected to the casing adjacent to the upper one of the shafts; a roller carried by the lower end of said arm and normally resting upon the wheel; a step to limit the swinging movement of the arm away from the end of the shaft; a slotted lever S pivotally connected to the casing below the wheel; a roller carried by said lever and normally held in contact with said wheel; and a step to limit the movement of said lever.

4. In combination with a suitable casing provided with inspection-openings B, C and D, a pair of shafts mounted in said casing; a series of life rollers mounted in the casing; a band or web connected to the shafts and passing about the life rollers, substantially as shown and described, whereby one face of said web will be exposed to view at the inspection-opening B while the opposite face will be brought to view at the inspection-opening C; a wheel mounted intermediate said shafts; a slotted arm P pivotally connected to the casing adjacent to the upper one of said shafts; a roller carried by the lower end of said arm; a step to limit the movement of said arm away from the shaft; a slotted weighted lever S pivotally connected to the shaft below the wheel; a roller carried by the upper end of said lever; a step to limit the swinging movement of said lever; a second pair of shafts located in the upper portion of the casing adjacent to the inspection-opening D; a web passing from one to the other of said shafts past the inspection-opening D; and connections between said second pair of shafts and the first pair of shafts whereby motion is imparted to said second shafts as one or the other of said first pair is moved.

697,882. MECHANICAL DICTIONARY. GEORGE W. MAXWELL, Los Angeles, Cal. Filed Nov. 8, 1901. Serial No. 61,728. (No model.)

Claim.—1. In an apparatus of the character described, the combination of a pair of shafts; a web extending from one to the other of said shafts and adapted to be wound about said shafts in reverse directions; a disk carried by the end of each of said shafts; a continuously-rotating shaft mounted in line with the faces of said disks; a friction-wheel slidably mounted upon said shaft and rotating therewith; and means controllable from without the apparatus for shifting the wheel upon the rotatable shaft to bring it into contact with one or the other of the disks, substantially as described.

2. In an apparatus of the character described, the combination of a pair of shafts; a web extending from one to the other of said shafts and adapted to be wound about said shafts in reverse directions; a disk carried by each of said shafts; a shaft extending past the faces of said disks; a friction-wheel slidably mounted upon said shaft; means for bringing said wheel into operative relation with one or the other of said disks; and means for automatically shifting said wheel when the entire web has been nearly wound around one of said web-carrying shafts.

3. In an apparatus of the character described, the combination of a pair of shafts; a web extending from one to the other of said shafts and adapted to be wound about said shafts in reverse directions; means controllable from without the apparatus for causing one or the other of said shafts to be rotated; and means operated by the rotation of one of the shafts for stopping the rotation of the shaft when the web has been wound about the shaft a predetermined distance.

4. In an apparatus of the character described, the combination of a pair of shafts; a web extending from one to the other thereof and adapted to be wound about said shafts in reverse directions; a friction-disk carried by the end of each of said shafts; a third shaft mounted in line with the faces of said disks; a friction-wheel slidably mounted on said shaft; means for rotating the shaft; and means controllable from without the apparatus for moving the wheel into contact with one or the other of said disks and to position the same with reference thereto, whereby the speed of rotation of the web-carrying shafts may be regulated and determined.

5. In an apparatus of the character described, the combination of a pair of shafts; a web extending from one to the other of said shafts and adapted to be wound about said shafts in reverse directions; disks carried by the ends of each of said shafts; a third shaft mounted in line with the faces of said disks; a friction-wheel slidably mounted upon said shaft; means for determining the position of said wheel upon the shaft and its relation to the disks; and means for maintaining the wheel in proper frictional contact with the disks.

6. In an apparatus of the character described, the combination of a pair of shafts; a web extending from one to the other of said shafts; a friction-disk carried by the end of each of said shafts; a third shaft mounted in line with the faces of said disks; a friction-wheel slidably mounted upon said shaft; means for continuously operating said shaft; means controllable from without the apparatus for shifting the wheel upon the shaft to bring it into contact with one or the other of said disks, substantially as described.

ble from without the apparatus for positioning the friction-wheel with relation to the disks; and means for automatically shifting the position of the wheel when the web has traversed a predetermined distance in one or the other direction.

7. In an apparatus of the character described, the combination of a pair of shafts; a web connected to said shafts and arranged to be wound about said shafts in reverse directions; a disk connected to the end of each of said shafts; a third shaft extending parallel to the faces of said disks; means for continuously rotating said shaft; a friction-wheel slidably mounted upon said shaft; a sliding frame mounted adjacent to the shaft and in operative connection with the friction-wheel; means controllable from without the machine for raising or lowering the frame and thereby bringing one or the other of the disks into operative relation with the friction-wheel; and connections substantially such as described between the frame and one of the shafts for automatically shifting the position of the frame when the entire web is substantially wound about one of the web-carrying shafts.

8. In an apparatus of the character described, the combination of a pair of shafts; a web connected thereto and arranged to be wound about said shafts in reverse directions; a disk carried by the end of each of said shafts; a third shaft extending parallel to the faces of said disks; means for rotating said shaft; a friction-wheel slidably mounted upon said shaft; a frame mounted in suitable bearings adjacent to the shaft; means controllable from without the apparatus for shifting the position of the frame to bring the wheel into contact with one or the other of said disks; a pair of racks carried by said frame; a counter-shaft driven from the rotating shaft; pinions loosely mounted on said shaft and in engagement with the racks of the frame; a clutch slidably mounted upon said counter-shaft and rotating therewith; and connections between said clutch and a moving part of the apparatus to shift the clutch into operative connection with one or another of said pinions when the web has been practically wound about one of said web-carrying shafts.

9. In an apparatus of the character described, the combination of a pair of shafts; a web extending from one to the other of said shafts and arranged to be wound about said shafts in reverse directions; a disk carried by the end of each of said shafts; a third shaft extending parallel to the faces of said disks; means for positively rotating said shaft; a friction-wheel slidably mounted upon said shaft; a frame mounted in suitable bearings and moving parallel with the length of said third shaft; a rack mounted on the frame; a pinion engaging said rack; connections substantially as described extending to the outer portion of the apparatus and under the control of the user to elevate said pinion and thereby to elevate or depress the frame; a second pair of racks also connected to the frame; a counter-shaft extending through an opening in the frame in line with said pair of racks; driving connections intermediate said counter-shaft and the main driving-shaft; pinions loosely mounted on said counter-shaft and in operative connection with each of said pair of racks; a sliding clutch mounted on the counter-shaft; a shifter for said clutch adapted and arranged to move said clutch into operative connection with one or the other of said pinions; connections intermediate said shifter and one of the web-carrying shafts; and clutch-releasing devices carried by the frame to release the clutch when the frame has been elevated or depressed to the required degree.

10. In an apparatus of the character described, the combination of a pair of shafts; a pair of webs extending from one to the other of said shafts and arranged to be wound about said shafts in reverse directions; means for positively rotating one or the other of said shafts; a second pair of shafts; a pair of webs connected to said shafts; driving connections intermediate said second pair of shafts and one of said first pair, said connections being such that the second pair of shafts is driven at a relatively low speed; a third pair of shafts; a third set of webs connected to said shafts; driving connections between said third pair of shafts and the first pair of shafts; and a fourth pair of webs connected to shafts mounted and rotated by the outer ends of said third pair of shafts, substantially as described.

697,888. MACHINE FOR GRINDING AND POLISHING STEEL OR OTHER METALLIC SURFACES. JAMES W. HALLAM and HENRY HALLAM, Birmingham, England. Filed Oct. 21, 1901. Serial No. 70,028. (No model.)

Claim.—1. In a machine for grinding and polishing pans, the combination of a conveyor having means for holding the pans, means for feeding the pans, including an electromagnet arranged in juxtaposition to the conveyor, and means to hold the pans in the path of the pan-holding means on said conveyor.

2. In a machine for grinding and polishing pans, the combination of a conveyor provided with supports for holding the pans and a grinding and polishing device, said supports being arranged longitudinally of the conveyor and having jaws adapted to receive the pans and feeding means to

feeding the pans, including a magnet arranged to hold the pans in the path of the jaws.

3. In a machine for grinding and polishing pans, the combination of a grinding and polishing device, of a conveyor having jaws arranged to hold the pans, the respective jaws serving to grip the pans, means for actuating the jaws, and superposed plates between which the conveyor is arranged to travel, said plates being adjustably mounted and collapsible respectively with the jaw-actuating means.

4. In a machine for grinding and polishing pans, the combination of a grinding and polishing device, a conveyor having means for holding the pans and presenting them successively to said grinding and polishing device, means for feeding the pans crosswise of the line of travel of the conveyor, including an electromagnet, and a spring collapsible with the ends of the magnet, the spring being adjustably mounted and arranged in the path of the pans as they progress toward said conveyor.

697,884. TYPE-WRITER. JOHN W. PAUL, Birmingham, Pa., assignor to Pitney Writing Machine Company, Troy, Pa. Filed May 1, 1901. Serial No. 61,577. (No model.)

Claim.—1. In a type-writer, a type-bar action comprising a substantially normally horizontally arranged pivoted type-bar, a key-lever located thereunder, a substantially horizontally arranged member located between said key-lever and type-bar, the intermediate member operatively connected with said type-bar and a direct-connection between the key-lever and said horizontal member.

2. In a type-writer, a type-bar action comprising a substantially normally horizontally arranged pivoted type-bar, having a projection at its pivotal end, a key-lever located thereunder, and a rigid pivoted intermediate horizontal member having a socket at one end and receiving the type-bar projection, and a connection at its opposite end with said key-lever.

3. In a type-writer, a type-bar action comprising a substantially normally horizontally arranged pivoted type-bar having a projection at its pivotal end, a key-lever, and a pivoted intermediate member having at one end a socket receiving said type-bar projection, and a cam connection between its opposite end and said key-lever.

4. In a type-writer, a type-bar action comprising a substantially normally horizontally arranged pivoted type-bar, a key-lever, an essentially L-shaped intermediately-pivoted lever having horizontal and vertically-projecting arms, the horizontal arm having at its end a socket engaging the pivoted end of the type-bar, and its vertical end operatively connected with the key-lever.

5. In a type-writer, a type-bar action comprising a substantially normally horizontally arranged pivoted type-bar having a projection at its pivotal end, a key-lever, a substantially horizontally-arranged L-shaped intermediately-pivoted lever located thereunder, the said lever having horizontal and vertically-extending arms, the end of the horizontal arm provided with a socket receiving the type-bar projection, and the vertical arm operatively connected with the key-lever.

6. In a type-writer, a type-bar action comprising a substantially normally horizontally arranged pivoted type-bar, an intermediately lever located under the type-bar, the said intermediate lever having an inwardly-extending horizontal arm operatively connected with the pivoted end of the type-bar, a key-lever located below the said intermediate lever, the intermediate lever having at its pivoted end a depending arm operatively connected with the key-lever.

7. In a type-writer, a type-bar action comprising a substantially normally horizontally arranged pivoted type-bar, an intermediately lever pivoted at one end near the free end of the type-bar, the free end of the intermediate lever directly operatively connected with the type-bar, and a key-lever located below the intermediate lever and directly operatively connected with the said intermediate lever.

8. In a type-writer, a type-bar action comprising a substantially normally horizontally arranged pivoted type-bar, an intermediately lever pivoted near but below the free end of the type-bar, the free end of the lever being operatively connected with the pivoted end of the type-bar, a key-lever below the intermediate lever and pivoted at a point below and between the end of the type-bar and the said lever, the pivoted end of the said intermediate lever being connected with the key-lever at a point intermediate the ends of the latter.

9. In a type-writer, a type-bar action comprising a plurality of substantially normally horizontal pivoted type-bars arranged in the arc of a circle, a plurality of key-levers, a plurality of essentially L-shaped pivoted levers having horizontal and vertically-extending portions their horizontal portions operatively connected with the type-bars, and their vertical portions of various lengths, and cam connections of various pitches between the key-levers and the vertical portions of the said L-shaped levers.

10. In a type-writer, a type-bar action comprising a plurality of pivoted type-bars arranged in the arc of a circle, a plurality of pivoted L-shaped levers located therebelow and arranged in a corresponding arc, the vertical portions of the L-shaped levers at either side of the central one increasing in length, a plurality of key-levers arranged in a common horizontal plane, and operative connections between the ends of said L-shaped levers, the type-bars and key-levers respectively.

11. In a type-writer, a type-bar action comprising a plurality of pivoted type-bars arranged in the arc of a circle, a plurality of pivoted L-shaped levers located therebelow and arranged in a corresponding arc, a plurality of key-levers located below the L-shaped levers, connections between the vertical portions of the L-shaped levers and the key-levers, all of said connections arranged in substantially the same horizontal plane, and connections between the horizontal ends of the said L-shaped levers and the type-bars.

12. In a type-writer, a type-bar action comprising a plurality of pivoted type-bars arranged in the arc of a circle, a plurality of pivoted L-shaped levers located therebelow and arranged in a corresponding arc, the downwardly-projecting ends of the L-shaped levers at opposite sides of the central one being deflected and arranged in substantially a true vertical plane, a plurality of key-levers having a movement in substantially

a true vertical plane, and operative connections between opposite ends of the L-shaped levers.

13. In a type-writer, a type-bar action comprising a plurality of pivoted type-bars arranged in the arc of a vertical circle, a plurality of L-shaped levers located therebelow and arranged in a corresponding arc, the said L-shaped levers pivoted at the junction of the arms of the L, a plurality of key-levers, cam connections between the vertical arms of the L-shaped levers and the said key-levers, the cam connections consisting of cam-discs and pins engaging therein.

14. In a type-writer, the combination of a plurality of type-bars arranged in the arc of a vertical circle, a plurality of L-shaped levers having horizontal and vertically-projecting arms located therebelow, pivoted supports for the said levers at the junction of the arms constituting the L-shaped levers, an operative connection between the free ends of the horizontal arms and the type-bars, the vertical arms of the L-shaped levers provided with cam-shaped discs all of which are located in the same horizontal plane, and a plurality of key-levers located in a corresponding horizontal plane and provided with projections engaging the said cam-discs.

15. In a type-writer, a type-bar action comprising a frame, a plurality of type-bars pivoted therein and arranged in the arc of a vertical circle, a plurality of key-levers having their inner ends loosely connected with the said frame at a point below and between the ends of the type-bars, a plurality of L-shaped levers pivoted at the junction of the arms constituting the L-shaped levers, the said pivoted point located below and adjacent the free ends of the type-bars, and direct operative connections between the ends of the L-shaped levers and the type-bars and key-levers respectively.

16. In a type-writer, a type-bar action comprising a vertically-movable frame, a plurality of type-bars pivoted in one end thereof and arranged in the arc of a vertical circle, a plurality of L-shaped levers arranged in a corresponding arc and pivotedly supported in the said frame at the junction of the arms constituting the L-shaped levers, the pivoted point located at a point between the ends of the said frame, a plurality of key-levers located below the L-shaped levers and having their inner ends loosely connected with the frame at a point between the ends of the horizontal portions of the L-shaped levers, and operative connections between the ends of the L-shaped levers and the type-bars and key-levers respectively.

17. In a type-writer, a type-bar action comprising a frame, a plurality of type-bars pivotedly supported in one end of the frame and arranged in the arc of a vertical circle, a plurality of key-levers supported in the same frame and having their inner ends loosely connected therewith, and a plurality of intermediate connecting members having one end connected with the pivoted ends of the type-bars and their opposite ends connected with the key-levers at points between the ends of the key-levers.

18. In a type-writer, a type-bar action comprising a vertically-shifting frame, a plurality of type-bars pivoted at one end of the frame and arranged in the arc of a vertical circle, a plurality of key-levers located below the type-bars and having their inner ends loosely supported by the said frame at a point intermediate the ends of the frame, the end of the frame opposite the pivoted point of the type-bars provided with a depending key-lever-guiding device, and intermediate connections between the key-levers and the type-bars.

19. In a type-writer, the combination of a vertically-shifting type-bar action, and a counterweight operatively connected therewith and of less bulk than the bulk of the type-bar action, and serving to assist in moving the type-bar action vertically.

20. In a type-writer, the combination of a substantially horizontally arranged vertically-shifting type-bar action having a pivotal support at one side of the center thereof, a key-lever for moving the said type-bar action upward, and a counterweight connected therewith and serving to assist the key-lever in moving the type-bar action upward.

21. In a type-writer the combination of a substantially horizontally arranged vertically-shifting type-bar action including type-bars, a pivotal connection therefor located at one side of its center, and a counterweight operatively connected with the heavier portion of said type-bar action, and serving to counterbalance it.

22. In a type-writer the combination of a substantially horizontally arranged vertically-shifting type-bar action, a pivotal support for one end of the said type-bar action, and a counterweight operatively connected with the free end of said type-bar action, and serving to assist in moving the type-bar action.

23. In a type-writer the combination of a substantially horizontally arranged vertically-shifting type-bar action, a counterweight connected therewith, a key-lever, and a connection between the type-bar action and the key-lever at a point intermediate the latter.

24. In a type-writer the combination of a substantially horizontally arranged vertically-shifting type-bar action pivotedly supported at its outer portion, a counterweight operatively connected therewith to assist in moving the

type-bar on the free end thereof, and a compound key-lever connection for shifting the free end of said type-bar.

25. In a type-writer the combination of a substantially horizontally arranged vertically-shifting type-bar action pivotedly supported at its outer portion, and a compound key-lever connected therewith and constructed to lift the type-bar when the key-lever is depressed.

26. In a type-writer the combination of a substantially horizontally arranged vertically-shifting pivoted type-bar action, an intermediately-pivoted member having one end operatively connected with the free end of said type-bar action, a shifting lever pivoted at one end and having an intermediate connection with the opposite end of said intermediately-pivoted member.

27. In a type-writer the combination of a substantially horizontally arranged vertically-shifting pivoted type-bar action, an intermediately-pivoted member having one end operatively connected with the free end of said type-bar action, an inwardly-extending shift-lever having its inner end independently pivotedly supported, and a connection between the opposite end of the intermediately-pivoted member and the shift-lever at a point intermediate the ends of the latter.

28. In a type-writer, the combination of a substantially horizontally arranged vertically-shifting pivoted type-bar action, an intermediately-pivoted member having one end operatively connected with the free end of said type-bar action, a shift-lever pivoted at one end to an independent support, and a link connected to the opposite end of the intermediately-pivoted member and to the shift-lever at a point intermediate the ends of the latter.

29. In a type-writer the combination of a substantially horizontally arranged vertically-shifting pivoted type-bar action, an intermediately-pivoted member having one end operatively connected with the free end of said type-bar action, and a counterweight connected with the opposite end of said intermediately-pivoted member and serving to depress the end of said lever with which it is connected.

30. In a type-writer the combination of a substantially horizontally arranged vertically-shifting pivoted type-bar action, an intermediately-pivoted member having one end operatively connected with the free end of said type-bar action, a counterweight in the form of a chain attached to and extending substantially parallel the opposite end of said intermediately-pivoted member.

31. In a type-writer the combination of a type-action including a plurality of key-levers, a universal carriage-feed member, a space-bar, and a lever pivoted at its inner end intermediately engaging said universal-feed member and its opposite end connected with the space-bar.

32. In a type-writer the combination of a frame, a type-action including a plurality of type-bars, a universal carriage-feed member adapted to be engaged thereby, a space-bar pivotedly connected with said frame, a lever extending over said universal feed member and pivotedly supported at its inner end, the outer end of said lever connected with the space-bar.

697,885. **SAFETY-LOCKING APPARATUS.** GEORGE J. ADAMS, Pittsburg, Pa., assignor to Harrold C. Adams, Pittsburg, Pa. Filed Mar. 20, 1897. Serial No. 690,017. (No model.)

Claim.—1. The combination of a jarring-block having a central passage through the same, a jarring-table resting on said block, a lifting-bar connected to said table and passing through said block, lifting mechanism operating upon said lifting-bar below the jarring-block, and adjustable guides within the jarring-block for controlling the movement of the lifting-bar, substantially as set forth.

2. The combination of a jarring-block having a central passage through the same, a jarring-table resting on said block, a lifting-bar connected to said table and passing through said block, lifting mechanism operating upon said lifting-bar below the jarring-block, horizontal slots formed in the jarring-block, and guide-blocks fitting in said slots and engaging with the lifting-bar, substantially as set forth.

3. The combination of a jarring-block having a central passage through the same, a jarring-table resting on said block, a lifting-bar connected to said table and passing through said block, lifting mechanism operating upon said lifting-bar below the jarring-block, horizontal slots formed in the upper part of the jarring-block and in the lower part of the jarring-block respectively, and guide-blocks fitting in said slots and engaging with the lifting-bar, substantially as set forth.

4. The combination of a jarring-block, a jarring-table, and a lifting-bar operating to raise said table and permit it to drop upon the jarring-block, said bar having outer more short cam-arms and one or more long cam-arms, substantially as set forth for the purposes set forth.

5. The combination of a jarring-block and a jarring-table, a flask, a reservoir, and a follower adapted to enter the reservoir and hold the said flask from rebounding in jarring, and a guide connected to and above the follower-body to hold the same horizontal, substantially as set forth.

6. The combination of a jarring-block, a jarring-table, a flask, a reservoir, a clamping-frame above the reservoir and carrying a guideway, and a follower having a guide entering said guideway, substantially as set forth.

7. The combination of a jarring-block, a jarring-table, a flask, a reservoir, a clamping-frame adapted to be secured to the table and carrying a guideway and having a support engaging with the reservoir, and a follower within said support adapted to enter the reservoir and having a guide entering said guideway, substantially as set forth.

8. The combination of a jarring-block, a jarring-table, a flask, a reservoir, a guided follower and a retainer for said follower arranged to prevent back movement thereof during the jarring operation, substantially as set forth.

9. The combination of a jarring-block, a jarring-table, a flask, a reservoir, and a clamping-frame engaging the reservoir and having depending bars detachably engaging with the jarring-table, substantially as set forth.

10. The combination of a jarring-block, a jarring-table having slots in the edges thereof, a flask, a reservoir, and a clamping-frame having depending arms entering said slots and carrying cams engaging with the lower face of the jarring-table, substantially as set forth.

11. The combination of a jarring-block, a jarring-table, a flask, a reservoir, a clamping-frame carried by said table and having a guideway thereon and a bearing above the guideway, a follower having a guide-bar entering said guideway and a cam mounted in said bearing and contacting with the upper end of the guide-bar, substantially as set forth.

12. The combination of a jarring-block, a jarring-table, a flask, a reservoir, a clamping-frame, a pulley above the table, a rope connected to the frame and passing over the pulley and a counterbalancing-weight connected to said rope, substantially as set forth.

13. In sand-molding apparatus, the combination of a jarring-block, a jarring-table, a flask, a reservoir, a clamping-frame, a pulley above the table, a rope connected to the frame and passing over the pulley and a counterbalancing-weight connected to said rope, and an operating-rope adapted to raise the weight and permit the descent of the clamping-frame, substantially as set forth.

14. The combination of a jarring-block, a jarring-table, a flask, a reservoir, a clamping-frame, a pulley above the table, a rope connected to the frame and passing over the pulley and a counterbalancing-weight connected to said rope, and an operating-rope adapted to raise the weight and permit the descent of the clamping-frame and having stops thereon, substantially as set forth.

15. The combination of a jarring-block, a jarring-table, a flask, a reservoir, a jarring-frame carrying a follower and having a bearing, a cam mounted in said bearing and engaging with the follower and having an arm thereon, a pulley above the jarring-table, a rope connected to said cam-arm and passing over said pulley, and a counterbalancing-weight connected to the rope, substantially as set forth.

16. The combination of a jarring-block, a jarring-table, a flask, a reservoir, a single clamping means arranged to secure both the reservoir and flask to the table, and a guided follower adapted to enter the reservoir, substantially as set forth.

17. The combination of a jarring-block, a jarring-table, a flask, a reservoir, a follower adapted to enter the reservoir and a retaining device arranged to engage therewith and prevent back movement during the jarring operation, substantially as set forth.

697,886. SAND-HOLDING APPARATUS. STEVEN J. ADAMS, Pittsburg, Pa., assignor to Harveith G. Adams, Pittsburg, Pa. Filed Mar. 20, 1897. Serial No. 698,918. (No model.)

Claim.—1. In sand-molding apparatus, the combination of a jarring-table, a flask, and a sand-feeding chute supported on the table independent of the flask, substantially as set forth.

2. In sand-molding apparatus, the combination of a jarring-table, a flask, and a sand-feeding chute permanently supported on the jarring-table independent of the flask, substantially as set forth.

3. In sand-molding apparatus, the combination of a jarring-table, a flask, a sand-feeding chute supported on the table independent of the flask, and clamping means between said flask and chute, substantially as set forth.

4. In sand-molding apparatus, the combination of a jarring-table, a flask, a sand-feeding chute supported on the table independent of the flask, and a sand-feeding chute engaging with the flask, substantially as set forth.

5. In sand-molding apparatus, the combination of a jarring-table, a flask, a sand-feeding chute above the flask, stationary vertical guideways, guides on the chute engaging said stationary guideways, and mechanism for raising the table and chute, substantially as set forth.

6. In sand-molding apparatus, the combination of a jarring-table, a sand-feeding chute permanently secured above the same, guides engaging with said table and with the upper part of said chute, and lifting mechanism for raising the table and chute, substantially as set forth.

7. In sand-molding apparatus, the combination of a jarring-table, a sand-feeding chute permanently secured thereon, guides engaging with the table and with the upper end of the chute, lifting mechanism above the chute and a flexible connection between said lifting mechanism and the chute, substantially as set forth for the purpose set forth.

8. In sand-molding apparatus, the combination of a jarring-table, a sand-feeding chute permanently secured thereon, a filling-engine above and connected to the chute and having a piston-rod extending above the engine, a head or end piston-rod and a stop engaging the said head, substantially as set forth.

9. In sand-molding apparatus, the combination of a jarring-table, a sand-feeding chute permanently secured thereon, lifting mechanism above the chute having a vertical depending rod carrying a pulley, guided pul-

leys above the chute and a flexible connection passing from said chute over said guided pulleys and over the pulley on the depending rod, substantially as set forth.

10. In sand-molding apparatus, the combination of a jarring-table, a flask, a sand-feeding chute supported on the table a short distance above the top of the flask, and a cutting-frame carrying a wire, said frame being adapted to pass within the space between the flask and chute, substantially as set forth for the purpose set forth.

11. In sand-molding apparatus, the combination of a jarring-table, a flask, a sand-feeding chute supported on the table a short distance above the top of the flask, and a cutting-frame carrying a wire, said frame being adapted to pass within the space between the flask and chute, substantially as set forth for the purpose set forth.

12. In sand-molding apparatus, the combination of a jarring-table, a flask, a sand-feeding chute supported on the table a short distance above the top of the flask, and a cutting-frame carrying a wire and back of the same a clecker, and adapted to pass in the space between the flask and chute substantially as set forth.

13. In sand-molding apparatus, the combination of a jarring-table, a flask and a sand-feeding chute supported on the table independently of the flask and having wires extending across near the base thereof to support the sand therein, substantially as set forth.

14. In sand-molding apparatus, the combination of a jarring-table, a flask, a sand-feeding chute supported on and movable with the jarring-table, a permanent sand-reservoir above and at one side of the chute and a horizontally-moving transfer-box adapted to receive the sand from the reservoir and pass over and deliver it to the chute, substantially as set forth.

697,887. METHOD OF FORMING SAND MOLDS. STEVEN J. ADAMS, Pittsburg, Pa., assignor to Harveith G. Adams, Pittsburg, Pa. Original application filed Mar. 20, 1897, Serial No. 698,917. Divided and this application filed Feb. 6, 1901. Serial No. 68,161. (No model.)

Claim.—1. The herein-described method of forming sand molds consisting in imparting one or more light or short distributing jets to the sand within the flask or core-box and subsequently imparting one or more heavy or long packing jets to each mold.

2. The herein-described method of forming sand molds consisting in imparting one or more light distributing jets to the sand within the flask, and then imparting two or more heavy packing jets to each mold, said packing jets increasing gradually in strength.

697,888. METHOD OF FORMING SAND MOLDS. STEVEN J. ADAMS, Pittsburg, Pa., assignor to Harveith G. Adams, Pittsburg, Pa. Original application filed Mar. 20, 1897, Serial No. 698,918. Divided and this application filed Feb. 6, 1901. Serial No. 68,162. (No model.)

Claim.—The herein-described method of forming sand molds, consisting in imparting a jet to a flask containing sand around the pattern and to a superimposed body of sand of sufficient height to act as a weight and prevent rebound of the sand in the upper part of the flask in the jarring action.

697,888.

697,889. PLOW. JAMES F. BARNES, Minn., assignor of one-half to F. H. Bennett and J. L. Hall, Minn. Filed Aug. 15, 1891. Serial No. 73,164. (No model.)

Claim.—In a plow, the combination with the plow-beam; of a forward set of cross-bars pivoted to the upper and lower sides thereof, a rear set of cross-bars also pivoted to the upper and lower sides of the plow-beam, links disposed between the ends of the forward set of cross-bars and the rear set of cross-bars and pivoted to said cross-bars, bifurcated plow-standards straddling said links and beam, trusses connecting the outer standards to the rear ends of the links, bolts passed through the upper ends of said standards above the links and beam, bolts passed through said standards below the links and beam, a segmented perforated bar, and a pin adapted to pass through said perforations and lock the bar in adjustment with the beam, substantially as specified.

697,890. WOVEN TUBULAR FABRIC. WILLIAM BEN, LAWRENCE, Mass., assignor, by mesne assignments, to the Preston Hose and Tire Company, a Corporation of Maine. Filed Oct. 20, 1899. Renewed Jan. 22, 1902. Serial No. 69,890. (No specimen.)

Claim.—1. A two-tube of continuous woven fabric having a woven reinforcing-ply overlying the tread portion of the tube and a second woven

reinforcing-ply overlying the first, together with two sets of stitching-wraps interwoven with the same web-threads of the first reinforcing-ply, one set of said stitching-wraps being interwoven with web-threads of the tube proper and the other set being interwoven with web-threads of the second reinforcing-ply.

2. A two-tube of continuous woven fabric having a number of superposed woven reinforcing-ply overlying its tread portion, each ply having its own warp-threads while the same filling-threads is common to or continuous between the reinforcing-ply; together with stitching-wraps uniting the plys to each other and to the tube proper.

3. A two-tube of continuous woven fabric with a woven reinforcing-ply overlying its tread portion and a narrower woven reinforcing-ply overlying the first, each ply having its own warp-threads while the filling-threads extend continuously through both reinforcing-ply as follows: from one edge of the first ply part way through the latter and thence through the second ply and back through the same and thence through the first ply to the other edge thereof and back through the full width of said first ply; together with stitching-wraps uniting the two plys to each other and to the tube proper.

4. A two-tube of continuous woven fabric having a number of superposed woven reinforcing-ply overlying its tread portion and graduated in width, each ply having its own warp-threads, while the same filling-threads is common to or continuous between the reinforcing-ply; together with stitching-wraps uniting the plys to each other and the tube proper.

697,891. WOVEN TUBULAR FABRIC. WILLIAM BEN, LAWRENCE, Mass., and JAMES F. BARNES, Bangor, Minn., assignors to the Preston Hose and Tire Company, Bangor, Minn., a Corporation of Maine. Filed Jan. 4, 1900. Renewed Jan. 22, 1902. Serial No. 69,891. (No model.)

Claim.—1. Fabric hose for tires, the same comprising a continuously-woven tube, and a plurality of tubularly continuous reinforcing-ply overlying the tread portion of said tube and stitched together and to the tube.

2. Fabric hose for tires, the same comprising a continuously-woven tube, and a plurality of tubularly continuous reinforcing-ply overlying the tread portion of said tube, and single-ply lateral extensions from the junctions of said reinforcing-ply, the latter being stitched together and to the main tube together with the lateral extensions.

3. Fabric hose for tires, the same comprising a continuously-woven tube, and a plurality of tubularly continuous reinforcing-ply overlying the tread portion of said tube, together with stitching-wraps or tie-threads uniting the reinforcing-ply together and to the tube.

4. Fabric hose for tires, the same comprising a continuously-woven foundation-tube, a tread-reinforcing double ply at the middle and single ply at the sides, each ply having its own warps but the filling threads or web of the entire reinforcing being common to all the plys and extending as follows: from one edge of the single-ply portion of the reinforcing to the double-ply portion and then through the outer ply of the latter and on through the single-ply portion to the opposite edge from that first mentioned, thence back through this portion of two single ply and on through the inner ply of the double-ply portion of the reinforcing and back through the outer ply thereof and thence returning through the inner ply and the single-ply part of the reinforcing to the first-mentioned edge thereof.

697,892. ART OF WEAVING TUBULAR FABRIC. WILLIAM BEN, LAWRENCE, Mass., and JAMES F. BARNES, Bangor, Minn., assignors to the Preston Hose and Tire Company, Bangor, Minn., a Corporation of Maine. Filed Jan. 4, 1900. Renewed Jan. 22, 1902. Serial No. 69,892. (No specimen.)

Claim.—1. The improvement in the art of weaving tubular reinforced fabric for vehicle-tires, the same consisting in weaving a continuous tube and simultaneously weaving a multi-ply reinforcing over the tread portion thereof and uniting the same to the tube proper.

2. The improvement in the art of weaving tubular reinforced fabric for vehicle-tires, the same consisting in weaving a continuous tube and simultaneously weaving a multi-ply reinforcing over the tread portion thereof with a filling-threads common to all the reinforcing-ply, and uniting the same together and to the tube proper.

3. The improvement in the art of weaving tubular fabric for vehicle-

ties, the same consisting in weaving a continuous tube, simultaneously therewith weaving a plurality of tubular continuous reinforcing-pieces over the tread portion of the tube, and at the same time knitting the reinforcing-pieces together and to the tube proper.

4. The improvement in the art of weaving tubular fabric for vehicles, the same consisting in weaving a continuous tube, simultaneously therewith weaving a plurality of tubular continuous reinforcing-pieces over the tread portion of the tube, and single-ply lateral extensions from the junction thereof; and at the same time knitting the reinforcing-pieces together and to the tube proper.

5. The improvement in the art of weaving tubular fabric for vehicles, the same consisting in weaving a continuous tube, simultaneously therewith weaving a plurality of tubular continuous reinforcing-pieces over the tread portion of the tube, and single-ply lateral extensions from the junction thereof, all with one and the same filling-thread.

697,898. AUTOMATIC BRAKE. MATTHEW A. BONE, Milwaukee, Wis., assignor to Pawling and Harshbarger, a partnership composed of Almon Pawling and Henry Harshbarger, Milwaukee, Wis. Filed Jan. 2, 1900. Serial No. 791,508. (No model.)

Claim.—1. In an automatic friction-brake the combination of driving and driven members connected by a spiral friction-band, and a shell surrounding said friction-band and free to turn in one direction but held from turning in the opposite direction, the driving member and said friction-band being provided with beveled engaging faces adapted, when the driving member is turned in a direction to carry the shell with it, to force said band outwardly into engagement with said shell, substantially as and for the purpose set forth.

2. In an automatic friction-brake the combination of a driving member and a driven member connected by a spiral friction-band, a shell surrounding said friction-band and free to turn in one direction but held from turning in the reverse direction, the friction-band being connected with the driving member by a block held in a recess of said member and having beveled ends which are adapted, by engagement with beveled ends of said shell, to force said band outwardly into engagement with said shell, substantially as and for the purpose set forth.

3. In an automatic friction-brake the combination with a rotary shaft supported by suitable bearings, of a driving member fixed upon said shaft, a driven member loosely mounted on said shaft, a spiral friction-band for transmitting motion from one member to the other, a perforated barrel loosely inserted between said members inside of said band, and a cylindrical shell supported concentrically with said shaft around said friction-band and free to turn in one direction but held from turning in the other direction, substantially as and for the purpose set forth.

4. In an automatic friction-brake the combination of a driving member, a driven member, a shaft extending continuously through both members, one of which is fixed and the other loose on said shaft and having a supporting-bearing outside of each of said members, a spiral friction-band connecting said members, a cylindrical shell surrounding said friction-band and free to turn therewith in one direction, a ratchet-wheel fixed to said shell and a pawl adapted by engagement with said ratchet-wheel to prevent said shell from turning in the opposite direction, substantially as described.

5. In an automatic friction-brake the combination of coaxial driv-

ing and driven members, a spiral friction-band connecting them, a shell surrounding said band and free to turn therewith in one direction, a ratchet-wheel fixed to said shell and provided with friction-faces perpendicular to its axis, and a pawl pivoted to a stationary support for holding said shell from turning in the opposite direction and provided with opposing friction-faces, a spring pressing said blocks outwardly against said friction-faces and adapted to move said pawl into engagement with the ratchet-wheel when it is turned in one direction, and out of engagement therewith when it is turned in the other direction, substantially as described.

6. In an automatic friction-brake the combination with driving and driven members, one fixed and the other loosely mounted on a shaft, a spiral friction-band connecting said members, a cylindrical shell surrounding said band and free to turn therewith in one direction, and means for holding said shell from turning in the opposite direction, said shell having closed ends and being adapted to contain oil, and the driven member having a hub or sleeve which projects through and is fixed to turn in one end of said shell, substantially as and for the purpose set forth.

7. In an automatic friction-brake the combination of driving and driven members, a spiral friction-band connecting said members, a cylindrical shell surrounding said band and free to turn therewith in one direction, means for holding said shell from turning in the other direction, a sleeve to which the driven member is fixed, extending through and adapted to turn in one end of said shell, and a shaft passing axially through both members of the brake, substantially as and for the purpose set forth.

697,894. RUT-LICK. RYMER LAMER, Spring Valley, Minn. Filed Oct. 10, 1891. Serial No. 73,268. (No model.)

Claim.—A rut-licking washer consisting of a concave resilient plate having a hub-hole and adjacent thereto a series of indentations in its inner face, whereby the metal of the washer is upset forming projecting teeth, said teeth terminating short of the edge of the washer, as set forth.

697,895. VEHICLE. FRANK BONE, Crescent City, Cal., assignor of one-half to William P. Butler, San Francisco, Cal. Filed Sept. 21, 1901. Serial No. 78,984. (No model.)

Claim.—The combination with the running-gear and body of a vehicle, of a pair of bars connected to the lower face of the said body and having their ends projecting outwardly from the body, each of the said ends of the said bars provided with an opening, a series of standards secured at their lower ends with the upper face of the running-gear, a series of hangers secured to the lower face of the said standards, the latter supporting the said hangers, said hangers having their upper ends terminating in a hook, and a series of springs connected at one end to the hooks of the hangers and at their other end in the openings of the bars, substantially as shown and described and for the purpose set forth.

697,896. COIN-DELIVERY DEVICE. JAMES H. BROWN, Denver, Colo., assignor of one-half to Burton Brown, Denver, Colo. Filed June 6, 1901. Serial No. 62,417. (No model.)

Claim.—1. In a coin-delivery device, the combination with a suitable casing and a coin-tray mounted thereon, of a platform provided with channels in line with the coin-receptacles of the tray, coin-ejecting tongues located in said channels, means for operating said tongues to eject coins from the bottoms of the stacks in the receptacles, and means for depressing the forward extremities of the tongues to a position below the plane

of the coin during the backward movement, and raising the same to the plane of the lowermost coin during the forward movement.

2. The combination with a casing and coin-receptacles, of a platform mounted on the casing, coin-ejecting tongues supported by said platform, means for reciprocating the tongues to eject coins, and means for depressing the tongues to a position below and out of contact with the coins during the backward movement, whereby said movement is unimpeded by the gravity of the coins.

3. The combination with a casing and coin-receptacles, of a platform mounted on the casing and provided with channels in line with the coin-receptacles, said channels being provided with upper and lower guide-grooves, tongues arranged to reciprocate in said channels, and provided with projections adapted to engage said guide-grooves, and means for depressing the forward extremities of the tongues as they begin their backward movement whereby the projections are made to travel in the lower groove during the backward movement, and means for raising the tongues as they reach their rearward limit of movement, whereby their projections are in position to travel in the upper groove during the forward movement.

4. The combination of a casing and coin-receptacles, of a platform mounted on said casing, channels formed in the platform in line with said coin-receptacles, slides located in the channels, tongues hinged to the slides, and springs located in the bottoms of the channels and arranged to throw the forward extremities of the tongues upward previous to beginning the forward movement, and downward previous to beginning the backward movement.

5. The combination with a casing and coin-receptacles, of a platform located below the plane of the coin-receptacles, and provided with ledges forming a support for the lowermost coin of the receptacles, the platform being provided with channels in line with the coin-receptacles, coin-ejecting tongues located in said channels, slides to which said tongues are pivoted, each tongue being provided with two depending, expanded projections, and springs located in the bottoms of the channels and adapted to engage one projection of the tongues before they begin the forward movement and the other projection before they begin the backward movement, whereby the forward extremities of the tongues are arranged to travel in different phases while making the two movements.

6. The combination with a casing and coin-receptacles, of a platform, coin-ejecting tongues mounted on said platform, ball-crank levers, a connection between each tongue and one arm of its corresponding lever, depending rods connected with said levers, slides having projections adapted to engage said rods, levers connected with said rods at one extremity, other slides connected with the levers at the opposite extremity, and expanded levers for operating the last-named slides.

7. The combination with a casing, coin-receptacles, and coin-ejecting tongues, of ball-crank levers mounted to move in horizontal planes, a connection between one arm of each lever and its corresponding tongue, depending rods connected with the other arms of the levers, slides having levers adapted when actuated to engage said depending rods, and a spring-

hold retracting-slide having projections engaging the rods from opposite sides from the projections of the first-named slides.

8. The combination with coin-receptacles, and coin-ejecting mechanism, of means for operating said mechanism, comprising ball-crank levers suitably arranged, depending rods connected with said levers, slides having projections adapted to engage said rods, levers connected with said slides at one extremity, other slides connected with the levers at the opposite extremity, and expanded levers for operating the last-named slides.

9. The combination with a casing, coin-receptacles, and means for ejecting the coins from said receptacles, of levers exposed on the casing and having stems passing through slots formed therein, slides with which the levers are connected, levers suitably arranged and connected with said slides at one extremity, other slides connected with the levers at the opposite extremity and provided with projections, rods treated in the path of said projections, and ball-crank levers connected with the rods and with the coin-ejecting mechanism, the arrangement being such that said mechanism is actuated by the movement of the levers.

10. The combination with coin-receptacles, and coin-ejecting mechanism, of ball-crank levers connected with said mechanism, rock-shafts upon which said levers are mounted, said shafts being provided with crank-arms at the extremities remote from the ball-crank levers, rods connecting the crank-arms of the rock-shafts and the ball-crank levers, slides provided with projections adapted to engage the rods, levers connected with the slides at one extremity, other slides connected with the levers at the opposite extremities of the levers, and operating-levers mounted on the casing and connected with the last-named slides.

11. The combination with coin-receptacles, and coin-ejecting mechanism, of ball-crank levers connected with said mechanism, rock-shafts upon which said levers are mounted, said shafts being provided with crank-arms at the extremities remote from the ball-crank levers, rods connecting the crank-arms of the rock-shafts and the ball-crank levers, slides provided with projections adapted to engage and actuate the rods, and a spring-held retracting-slide having projections engaging the rods on opposite sides from the projections of the first-named slides.

12. The combination with coin-ejecting mechanism, of ball-crank levers connected therewith, depending rods connected with the ball-crank levers, slides provided with projections adapted to engage the rods on the slides are operated, and a spring-held retracting-slide having projections engaging the rods on opposite sides from the projections of the first-named slides.

13. The combination with a casing, coin-receptacles, and coin-ejecting mechanism, of ball-crank levers connected with said mechanism, rods connected with said levers, slides having projections arranged to engage the rods on one side, a retracting-slide having projections engaging the rods on the opposite side, and a spring-held coacting device with which the retracting-slide is connected, the arrangement being such that as the first-named slides are shifted, one or more of the rods are moved in one direction to operate the coin-ejecting mechanism, the retracting-slide being also operated and its spring placed under tension whereby as the operating force ceases to act, the retracting-slide returns the rods and their connections to their normal position.

14. The combination with a casing, coin-receptacles, and coin-ejecting mechanism, of ball-crank levers connected with said mechanism, rods connected with said levers, slides having projections engaging said rods, each slide having one or more projections according to the number of rods to be actuated by each slide, a retracting-slide having projections engaging the rods on opposite sides from the first-named slides, a spring-held coacting part connected with the retracting-slide whereby the coacting part is actuated and its spring placed under tension every time a rod is actuated by one of the other slides, and a part slidable in the coacting device and adapted to be projected to a position to engage and operate a certain rod every time any other rod or set of rods is actuated, whereby the amount of change to be ejected at each operation may be increased by a uniform amount, and suitable means for actuating the sliding part of the coacting device.

15. The combination with coin-ejecting mechanism, of frames, each composed of a rock-shaft and a rod extending parallel therewith, crank-arms connecting the rod and shaft, a suitable operative connection between the said frames and the coin-ejecting mechanism, slides provided with projections arranged to engage and actuate one or more of the frames, whereby the coin-ejecting mechanism is actuated, each slide being arranged to operate one or more frames, and a spring-held retracting-slide having projections engaging the rods on opposite sides from the projections of the first-named slides.

16. The combination with coin-ejecting mechanism, of frames, each composed of a rock-shaft and a rod extending parallel therewith, crank-arms connecting the rod and shaft, a suitable operative connection between the said frames and the coin-ejecting mechanism, slides provided with projections arranged to engage and actuate one or more of the frames, whereby the coin-ejecting mechanism is actuated, an auxiliary

part adapted to be projected to engage one of the frames, and a connection between said auxiliary part and each of the other frames whereby the said part is actuated every time any frame is actuated, the arrangement being such that the amount of coin delivered by each coin-ejecting operation, may be increased by a predetermined amount through the instrumentality of the auxiliary device.

17. The combination with coin-ejecting mechanism, of frames, each composed of a rock-shaft and a rod extending parallel therewith, crank-arms connecting the rod and shaft, a suitable operative connection between the said frames and the coin-ejecting mechanism, slides provided with projections arranged to engage and actuate one or more frames, whereby the coin-ejecting mechanism is actuated, each slide being arranged to operate one or more frames, a retracting-slide provided with projections engaging the rods of the frames on the opposite side from the projections of the other slides, whereby the retracting-slide is actuated every time any frame is actuated, a spring-held oscillating keeper actuated by the forward movement of the retracting-slide, and an auxiliary device slidably mounted in the keeper and arranged to be projected to engage an additional frame every time one or more of the other frames are actuated.

18. The combination with coin-ejecting mechanism, of frames composed of rock-shafts, crank-arms at its extremities, and a rod connecting said crank-arms, an operative connection between the said coin-ejecting mechanism and said frames, means for actuating the frames, an auxiliary device arranged to be projected to engage a certain frame, and a suitable connection between the auxiliary device and each of the other frames whereby as any frame is actuated, the additional frame is operated to eject an additional amount at each coin-ejecting operation.

19. The combination with coin-receptacles, coin-ejecting mechanism, rock-shafts connected therewith, depending rods connected with the rock-shafts, slides for actuating the rods, a spring-held retracting-slide arranged to be actuated every time a rod is actuated, an oscillating keeper connected with said retracting-slide, a spring-held auxiliary part slidable in the keeper and adapted to be projected to engage a certain rod, a rock-shaft, and a suitable connection between the rock-shaft and the auxiliary part for actuating the latter when the slide is actuated.

20. The combination with a casing, coin-receptacles and coin-ejecting mechanism, of levers slidable in the casing, front slides connected with the levers, rear slides, levers connecting the front slides and the rear slides, a suitable connection between the rear slides and the coin-ejecting mechanism, comprising ball-crank levers connected with the coin-ejecting device, rock-shafts upon which said levers are mounted, said shafts being provided with crank-arms at the extremities remote from the ball-crank levers, and rods connecting the crank-arms of the rock-shafts with the ball-crank levers, said rods being arranged to be operated by the movement of the rear slides which are provided with projections engaging the rods for the purpose, the arrangement being such that as the levers are moved the coin-ejecting device are actuated, and a spring-held retracting-slide having projections engaging the said rods on opposite sides from the projections of the rear slides.

697,897. ADVERTISING DEVICE. JAMES E. CUMMIS and Geo. W. REYNOLDS, Cambridgeport, Mass. Filed Sept. 28, 1901. Serial No. 71,881. (No model.)

Claim.—The combination with the case 5 having the top 6 with its slot 7 and perforation 8, and furnished with the end 10 having the opening 11, and the spring-operated button 12 working through the perforation 8, of the holder 17 having the compartments 19 and 20, and the mirrors 21 22, or their equivalents, contained in the compartments 20, as and for the purpose described.

697,898. ROTARY ENGINE. WILLIAM E. DODDGE, New York, N. Y., assignor to the American Motor and Power Company, Jersey City, N. J. Filed Apr. 23, 1901. Serial No. 58,951. (No model.)

Claim.—1. In a rotary engine, a plurality of cylinders, pistons concentrically and oppositely mounted therein, abutments mounted in the walls of said cylinders and bearing with their edges against said pistons, a shaft mounted to suitable bearings, crank-arms on said shaft and on said

abutments, and rods connecting said crank-arms whereby said abutments coast to keep the edges thereof against the respective pistons.

2. In a rotary engine a plurality of cylinders, pistons concentrically and oppositely mounted therein, abutments mounted in the walls of said cylinders and bearing with their edges against said pistons, a shaft mounted on the cylinders, crank-arms on said shaft and on said abutments, and rods connecting said crank-arms whereby said abutments coast to keep the edges thereof against the respective pistons, as and for the purpose set forth.

3. In a rotary engine a plurality of cylinders, pistons oppositely mounted therein, abutments mounted in the walls of said cylinders and bearing with their edges against said pistons, a shaft mounted on the cylinders, crank-arms on said shaft and on said abutments, and rods connecting said crank-arms whereby said abutments coast to keep the edges thereof against the respective pistons, one of said rods being composed of separate parts, and a compression-spring mounted between said parts, as and for the purpose set forth.

4. In a rotary engine, an abutment adapted to cooperate with the pistons, and a bearing-plate secured at one edge thereof to the under side of said abutment the other edge projecting outwardly at an angle to said under side of the abutment whereby a pocket is formed between them, the free edge of said plate acting as a bearing-strip, as and for the purpose set forth.

5. In a rotary engine, an abutment adapted to cooperate with the pistons, and a spring-plate secured at one edge thereof to the under side of said abutment, said plate projecting outwardly at an angle to the under side of said abutment whereby a pocket is formed between them, the free edge of said plate projecting in advance of said abutment to form a bearing-edge, as and for the purpose set forth.

6. In a rotary engine, a piston provided with a concave end and a head having a bearing for the main shaft extending within the plane of rotation of said piston, said bearing being provided with an oil-hole exposed to the motion of said piston, as and for the purpose set forth.

7. A rotary engine comprising a plurality of cylinders, circular pistons in said cylinders in substantially tangential contact with the walls thereof, and oppositely mounted, cut-off valves operated by an eccentric on the main shaft and alternately admitting steam to said cylinders, abutments mounted in the walls of said cylinders and bearing with their edges against said pistons, and means connecting said abutments whereby they coast to keep their edges in contact with the respective pistons, and grooves in said pistons whereby a water packing is provided, as for the purpose set forth.

697,899. GAS-PRODUCER. EDWARD J. DUFF, Liverpool, England. Filed Aug. 28, 1901. Serial No. 72,671. (No model.)

Claim.—1. A gas-producer having an upright rotating shell of polygonal cross-section internally and means for rotating it, and an ash-trough below it, substantially as described.

2. Improvements in gas-producers comprising a rotating shell as using the contour of the internal surface of which is polygonal in plan, the shell having a lower depending plate dipping into a water-cooled ash-trough, the upper end of said shell or casing being closed by a cover suspended from the charging-platform, a depending annular plate on the cover dipping into a liquid seal in a trough encircling the top end of the casing, substantially as and for the purposes herein set forth.

3. Improvements in gas-producers having a rotating shell of polygonal cross-section internally and provided with a water-cooled ash-trough, a liquid seal and cover-plate being arranged in connection with the upper end of the casing, substantially as and for the purposes herein set forth.

4. Improvements in gas-producers comprising a rotating shell or casing the contour of the internal surface of which is other than circular in plan, the casing being provided with a water-cooled ash-trough, and a liquid seal and cover-plate being arranged in connection with the upper end of the casing, substantially as and for the purposes herein set forth.

5. A gas-producer having an upright shell of polygonal cross-section internally and means for rotating it, with a water-cooled ash-trough and a cover-plate, substantially as described.

697,400. LIFT MECHANISM FOR TIN-PLATE. JAMES F. FAY, Pittsburg, Pa., assignor of one-half to John Hamilton, Pittsburg, Pa. Filed Sept. 8, 1901. Serial No. 72,110. (No model.)

Claim.—1. The combination with an actuating-shaft, of an eccentric pulley mounted thereon, and a flexible lifting device secured at one end to the periphery of said pulley and having means at its other end for carrying the article to be lifted thereby, substantially as described, whereby the speed with which the article is lifted is varied while the same is being lifted, as specified.

2. A plate-lifting mechanism for tinning apparatus, in the tin, comprising a device for carrying the plates, an eccentric lifting-pulley, means for turning said pulley, and a flexible connection between the periphery of said pulley and the plate-carrying device, substantially as described and for the purpose set forth.

3. A means for producing an approximately uniform coating of plates, or the tin, comprising, in combination, a vessel containing the coating liquid, an eccentric lifting-pulley, means for turning the latter, a flexible connection secured at one end to said eccentric pulley as to be lifted thereby at varying speed, and a plate-carrier attached to the other end of said connection, substantially as described and for the purpose set forth.

4. The combination with an actuating-shaft, of a pulley eccentrically mounted thereon, means for varying the eccentricity of said pulley, an article-carrier, and a flexible connection between the periphery of said pulley and said carrier.

5. The combination with an actuating-shaft, of an eccentric lifting-pulley fixed thereon, said pulley comprising an inner member fixed to the shaft, an outer member having an opening which receives said inner member and means for adjustably connecting said outer member with said inner member whereby the eccentricity of the former may be varied, a flexible lifting device attached at one end to the periphery of the outer member of said pulley and actuated thereby at variable speed, and an article-carrier connected to the other end of said lifting device.

6. The combination with a vessel containing a coating liquid, of a means for lifting therefrom the articles coated and for gradually reducing the speed of the articles while being elevated, said lifting means comprising an actuating-shaft, an eccentric pulley mounted thereon and having means for varying the eccentricity thereof, a shaft for the article be-

ing coated, and a flexible connection between said shaft and pulley, said connection having one of its ends attached to the periphery of said pulley.

697,401. RAIL-BRACE. JOHN E. GRABAM, Bannock, Va., assignor to the Graham Combined Guard-Rail and Frog Brass Company, Bannock, Va. Filed Feb. 24, 1901. Serial No. 69,280. (No model.)

Claim.—1. A rail-brace of a length to engage the webs of a pair of seated rails, the terminals of the brace being provided with tables to engage the under sides of the rail-heads and with guard-faces disposed at diverging angles to the inner sides of the tracks, thereby to adapt the brace to rails having tracks of different widths.

2. A rail-brace of a length to engage the webs of a pair of seated rails, the upper portions of the terminals of the brace being provided with tables to engage the under sides of the tracks and with guard-faces disposed at diverging angles to the inner sides of the tracks, and the lower portions of the terminals being provided each with a recess of a size to include a rail-base of any standard size.

697,402. CURB-PLANTER. WILLIAM S. GRABAM, Canton, Ill., assignor to Parlin & Granger's Company, Canton, Ill., a Corporation of Illinois. Filed Sept. 28, 1901. Serial No. 72,682. (No model.)

Claim.—1. In a curb-planter, the combination with a member and a rod-rod thereon, of a pair of cut-offs presented in opposite directions, whereby the said-rod may be driven in one direction to plant in short-cuts and in the contrary direction to drill the end.

2. In a planter, the combination of a shaft to drive the dropping mechanism, aatchet-wheel for the shaft comprising a notched disk having internally-extended pins, and a drive-part for the aatchet-wheel having a

slidewire-extended pin to engage the notches of the disk and a tooth to engage the pins of the wheel.

3. In a plunger, the combination of a shaft to drive the dropping mechanism, a lantern-wheel on the shaft the end disks whereof are notched in their peripheries, a rock-shaft, an arm on the rock-shaft and a pawl on the arm having laterally-extended pins to engage the notches of the disks and also having an end tooth to engage the rods of the lantern-wheel.

4. In a plunger, the combination of a shaft to drive the dropping mechanism, a lantern-wheel on the shaft, a rock-arm, a pawl on the rock-arm to drive the lantern-wheel, a brake-arm bearing against the rods of the lantern-wheel and a spring connecting an extension of the brake-arm with an extension of the rock-arm and tending to retract the pawl while holding the brake-arm to its work.

5. In a plunger, the combination with a ratchet-wheel on a drive-shaft and with a fixed part of the plunger-frame, of a rock-arm and a pawl on the rock-arm having an extension beyond its pivot to engage the frame when the pawl is not in use and hold the pawl out of contact with the ratchet-wheel.

697,408. PROPELLER FOR AIR-SHIPS. CHARLES GREEN-
BRIDGE, London, England, assignor of one-half to William Alfred South-
London, England. Filed Feb. 12, 1901. Serial No. 47,094. (No model.)

Claim.—1. In a propeller for flying-machines, air-ships, balloons, and the like, having a revolving vane-carrying frame and a vane-axis pivoting therein, the combination of a vane carried by a radius-bar flat on said axis, and which bar is constructed in two parts flexibly united in such a manner as to permit of the vane being turned into the propelling and feathering positions automatically by the pressure of the air.

2. In a propeller for flying-machines, air-ships, balloons, and the like, the combination of a revolving vane-carrying frame having a vane-axis pivoting therein, a vane carried by a radius-bar flat on said axis, the said bar constructed in two parts flexibly united in such manner as to permit of the vane being turned into the propelling and feathering positions automatically by the pressure of the air, and means for automatically rotating the vane backward at a certain point in its revolution.

3. In a propeller for flying-machines, air-ships, balloons, and the like, the combination of a revolving vane-carrying frame having a vane-axis pivoting therein and a vane carried by a flexible radius-bar flat on said axis, with a three-shank shaft flat on the vane-axis, a series of jointed levers connected at one end to said shaft, and pivoted to the frame near their other end, and stationary cams adapted to operate said levers for the purpose of turning the vane backward during feathering.

4. In a propeller for flying-machines, air-ships, balloons, and the like, the combination with a vane of the vane-carrying radius-bar formed in two parts flexibly united in alignment and rotatably mounted in bearings

upon a support flat on the vane-axis, and means adapted to offer resistance to the turning of said bar in its bearings, thereby permitting the vane to rise and fall and to yield under the pressure of the air during the propelling and feathering strokes respectively.

5. In a propeller for flying-machines, air-ships, balloons, and the like, the combination with a vane of the vane-carrying radius-bar (formed in two parts hinged together in alignment), a leg on each part and a tension-spring coupling the legs, said bar being rotatably mounted in bearings upon a support flat on the vane-axis and having a curved arm at its rear end connected by a tension-spring to a fixed support, and which spring is adapted to offer resistance to the turning of the bar on its own axis.

6. In a propeller for flying-machines, air-ships, balloons, and the like, the combination of the revolving frame, the vane-axis pivoting therein, the vane carried by a radius-bar flat on said axis, and means for automatically turning the vane forward at the commencement of feathering, with a catch flat on the vane-axis, a stop on the revolving frame adapted to engage said catch and lock the vane-axis during the propelling stroke, and means for automatically engaging and releasing said stop from said catch.

7. The combination with the revolving vane-carrying frame, of levers and rods connecting the vane-axis crank with an inclined plane flat on the axis of the revolving frame, to effect the engagement and disengagement of the catch and stop for locking and releasing the vane.

8. A propeller for flying-machines, air-ships, balloons, and the like, comprising a revolving frame, a vane carried by a radius-bar adapted to permit the vane to be turned into the propelling and feathering positions automatically by the pressure of the air, means for rotating the vane backwardly at the commencement of feathering, means for automatically locking and releasing the vane-axis to hold and set free the vane, and means for driving the whole vane-carrying frame around, whereby the vane is caused to fly out and travel in a wide radius during the propelling stroke, and to turn backward and travel in a lesser radius during feathering.

697,404. COMBINED SAFETY CLOTHES-LINE AND PEG
HOLDERS OR CLAMP. THOMAS GUNST, Auckland, New Zealand, as-
signor of one-half to Robert Foster, Auckland, New Zealand. Filed
July 20, 1901. Serial No. 70,128. (No model.)

Claim.—1. A clothes holder or clamp consisting of a lower piece provided with a pair of upwardly-extending projections, a lever mounted between said projections and eccentrically connected thereto, and an upper piece loosely fitted between the projections and adapted to overlap said lower piece when operated by said lever.

2. A clothes holder or clamp consisting of a lower piece provided with a pair of upwardly-extending projections, lever mounted between said projections and eccentrically connected thereto, and an upper piece loosely fitted between said projections and provided with a recess in which operates the eccentric portion of the lever.

3. A clothes holder or clamp consisting of a lower piece provided with a pair of projections, an upper piece mounted between said projections and provided with a recess, said pieces adapted to lap one over the other, and a lever mounted between said projections, eccentrically connected thereto and adapted to have its eccentric portion operate within said recess.

697,405. PAPER PAIL. WALTER C. HAAS, Dayton, Ohio, as-
signor of one-half to the Dayton Paper Novelty Company, Dayton, Ohio,
a Corporation. Filed Dec. 10, 1901. Serial No. 38,528. (No model.)

Claim.—1. A blank for a paper pail having two correspondingly-scored lines intersecting two correspondingly-scored lines extending transversely thereto forming four sides and one bottom section and four triangular corner-sections, a scored line bisecting each of said triangular-shaped corner-sections and a portion of the outer edges of said corner-sections being cut away whereby in folding the outer and inner layers of material upon opposite sides of the pail, one flange with the top of the pail, inter-

mediate layers of material terminating at a point below the top, substantially as specified.

2. A pail formed of a blank bent into shape, having corner-flaps formed in folding overlapping upon the opposite exterior sides of the pail, a half hatched through said overlapping flaps upon each side, leaving the adjacent inside walls unperforated, and a metallic binding-strip embracing the top edges of the pail, a portion of the top edges of the said overlapping flaps which occupies an intermediate position when the pail is formed, being cut away slightly, substantially as and for the purposes specified.

3. A pail formed of a blank bent into shape, having corner-flaps overlapping upon the opposite exterior sides of the pail, a half having inwardly-bent spring-shoulders, adapted to hold the cover on the pail, said half being pivoted to said overlapping flaps upon each side, leaving the adjacent inside walls unperforated, and a metallic binding-strip embracing the top edge of the pail and binding the inner walls to the outer layers of the said overlapping corner-flaps, substantially as described.

4. A paper pail or vessel formed of a single blank, and having a metallic binding-strip around the top edge of the pail, covering the top edges of the pail and the overlapping flaps together, a wedge-shaped cover of similar cross-section, adapted to be compressed into the mouth of the pail, a metallic binding-strip around the top edge of the cover, the lower edge of the said cover-binding strip being adapted to rest upon the top edge of the pail-binding strip when the cover is in position, a ball pivoted to the sides of the pail below its binding-strip and inwardly-bent spring-shoulders, formed on the ball, adapted to engage the top edges of the cover-binding strip, whereby the cover is held in position between metallic binding elements at the top and bottom, substantially as described.

697,406. GAME APPARATUS. MARTIN V. HANNAKE, Thibault, Va., assignor of one-half to Harry W. Miller, Thibault, Va. Filed Sept. 8, 1901. Serial No. 74,282. (No model.)

Claim.—1. A game apparatus comprising a board in the form of a star the points of which have runs for the use in playing games thereon, diagrams being formed on the surface of said board in its center and at regular intervals around it, which define the runs for the projection, or runs, and the counts which are used in the games played thereon, substantially as set forth.

2. A game apparatus comprising a board in the form of a star having stars represented on its surface with runs for projection at their points and center, the points at the points of the star extensions on the table, whereby it is adapted for the playing of games thereon with projection and a cue, substantially as set forth.

3. A game apparatus comprising a board, projecting leaves hinged to its sides which run to a point, a guide or flange around the sides, pockets in the ends of said leaves, whereby it is adapted for the playing of games thereon with projection and cue, substantially as set forth.

4. A game apparatus comprising a central horizontal board, pointed leaves attached thereto at each of its sides, means for supporting them, stars formed on the surface of said table in its center and in the center of each leaf, a flange around the edge of said leaves, and pockets in their ends, substantially as set forth.

697,407. CUTTING APPARATUS FOR MOWERS, REAPERS, OR THE LIKE. HARVEY L. BOWEN, Chicago, Ill., assignor, by direct and several assignments, to Hamilton Patent Company, Chicago, Ill., a Corporation of Illinois. Filed Dec. 1, 1901. Serial No. 31,128. (No model.)

Claim.—1. In a cutting apparatus for mowers, reapers and the like, the combination with the finger and outer bars, of a spring the rear end of which is vertically journaled on the finger-bar, and the front and ends thereof extend forward and bend downwardly on the outer bar as to move laterally when the outer-bar reciprocates.

2. In a cutting apparatus for mowers, reapers and the like, the combination with the finger and outer bars, of a spring having a coil intermediate of its length, one end of the spring being secured to the finger-bar and the other extending forward substantially in line with the first end and bending downwardly on the outer bar as to move laterally as the outer-bar reciprocates.

3. In a cutting apparatus for mowers, reapers and the like, the combination with the finger and outer bars, of a spring secured at one end to the finger-bar and at the other bearing downwardly on the outer bar as to move laterally as the outer-bar reciprocates, said spring having two coils intermediate of its length, one of said coils lying within the other.

4. In a cutting apparatus for mowers, reapers and the like, the combination with the finger and outer bars, of a clip having a notch, a spring journaled in said notch and free to oscillate therein, and a cutter or disk section having ribs or projections on its upper surface struck up from the metal.

5. In a cutter-cap for mowers, reapers and the like, the combination of a clip for attachment to the finger-bar, said clip having a vertical notch, and a spring having a vertical portion pivoted in the notch of the clip and a portion extending forwardly beyond the clip in position to bend downwardly on the outer-section.

6. In a cutter-cap for mowers, reapers and the like, the combination of a clip for attachment to the finger-bar, said clip having a vertical notch, and a spring having a vertical portion pivoted in the notch, and a portion extending forwardly beyond the clip in position to bend downwardly on the outer-section, said vertical portion of the spring having a hook to engage the clip and hold the pivotal portion in the notch in all operative positions of the spring.

7. In a cutter-cap for mowers, reapers and the like, the combination of a clip for attachment to the finger-bar, said clip having a vertical notch, and a spring having a vertical portion pivoted in the notch, and a portion extending forwardly beyond the clip in position to bend downwardly on the outer-section, said vertical portion of the spring having a hook which holds it in the notch in all vertical positions of the spring, and is releasable only when the spring is in an inoperative position.

8. A spring for the cutter-cap of mowers, reapers, and the like, having a vertical portion provided with a hook-like part at its end, a coil intermediate of its length, and a forward portion to bend downwardly on the outer-section.

9. A spring for the cutter-cap of mowers, reapers, and the like, having a hook at its rear end, one or more coils intermediate of its length, and a forward portion folded or doubled upon itself and adapted to bend downwardly upon the outer-section.

10. In mowers, reapers and the like, in combination with the finger and outer bars thereof, a spring outer-cap comprising a clip or spring-holder having a substantially vertical open-ended notch, and a spring having a substantially vertical portion adapted to be passed into the notch and provided with a hook at its lower end to engage the holder at the lower end of the notch and hold the spring in place.

11. In mowers, reapers and the like, in combination with the finger and outer bars thereof, a spring outer-cap comprising a clip or spring-holder having a substantially vertical open-ended notch, and a spring having a substantially vertical portion adapted to be passed into the notch and provided with a hook at its lower end to engage the holder at the lower end of the notch and hold the spring in place.

697,408. SPOOL AND PROCESS OF PRODUCING SAME. BENJAMIN HARRIS, Chicago, Ill. Filed Aug. 14, 1901. Serial No. 71,921. (No model.)

Claim.—1. The process of making a spool of fibrous pulp which consists of the following steps, to wit: first, molding a pulp-body with an axial aperture having recesses leading radially from it along its entire length, wedge-shaped in transverse section of the spool; second, drying each pulp-body to hardness; third, applying glue to the inner surfaces of each wedge-

shaped radial recesses; fourth, introducing endwise through the axial aperture and entering edgewise into the recesses respectively wood strips or base wedge-shaped in cross-section; fifth, passing longitudinally through the axial aperture a cylindrical mandrel adapted to cover all the wedge-shaped strips edgewise simultaneously into their respective apertures.

2. A spool, comprising a body molded of fibrous pulp, with an axial aperture having recesses leading off radially from it along its entire length, and wooden strips glued in such recesses.

3. A spool of fibrous pulp, having through its entire length a star-shaped wooden core with an axial aperture.

4. A spool, having a star-shaped wooden core with an axial aperture, and a pulp-body in which such core is embedded, such core being composed of strips wedge-shaped in cross-section, arranged with their bases or wider edges encompassing the central aperture.

5. A spool-body of molded fibrous pulp, having an axial star-shaped aperture extending from end to end.

697,409. SPEED-REGULATOR FOR EXPLOSIVE-ENGINE.
JOHN S. ELDER, CH. CHY., Pa. Filed May 2, 1901. Serial No. 55,554.
(No model.)

Claim.—1. In a mechanism compressing gases, the combination with the cylinder and compressing-piston therein; of a valve device arranged to control the period of admission of gases; means for opening and closing said valve device, said means being subjected to the reduction of pressure incident to the motion-stroke of the compressing-piston and an opposing pressure; and mechanism controlling the application of the pressure so reduced by the motion-stroke of the piston to open and close the valve.

2. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the period of admission of gases and for preventing an outflow of gas through the intake; and a fluid-actuated mechanism for closing said valve device during the intake movement of the piston.

3. In a mechanism compressing gases, the combination with the cylinder and compressing-piston therein; of a valve device controlling the period of admission of the gases and for preventing an outflow of gases through the intake; means for closing said valve device, said means being subjected to the reduction of pressure incident to the motion-stroke of the compressing-piston and an opposing pressure; and mechanism controlling the application of the pressure so reduced by the motion-stroke of the piston to close the valve.

4. In a mechanism compressing gases, the combination with a cylinder and a compressing-piston therein; of a valve device controlling the period of admission of gases to the cylinder; a fluid-actuated motor connected with said valve device; means for balancing the pressure on the moving element of the motor during the inflow of gas and for giving a preponderance of pressure to the closing side of the moving element of the motor to close the valve device.

5. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the period of admission of gases; a fluid-actuated motor for actuating said valve device; and means for subjecting one side of the moving element

of the motor to the reduced pressure in the cylinder incident to the intake movement of the piston for closing the valve device.

6. In a mechanism compressing gases, the combination with a cylinder and a compressing-piston therein; of a valve device controlling the period of admission of gases therein; a fluid-actuated motor for operating said valve device; means for subjecting both sides of the moving element of the motor to atmospheric pressure during the inflow of gas and for subjecting one side of the moving element of the motor to the reduced pressure of the cylinder incident to the intake movement of the piston to close the valve device.

7. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device for controlling the inflow of gas; a fluid-actuated motor for operating said valve device; means for subjecting the side of the moving element of the motor opposed to the closing movement of the valve to a balancing pressure during the inflow of gas; a valve mechanism for cutting off the supply of the fluid furnishing the balance of pressure; means for subjecting the side of the moving element of the motor opposed to the closing movement of the valve device to the reduced pressure in the cylinder incident to the intake movement of the piston for closing said valve.

8. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the period of admission of gases, said valve device being arranged to open in the direction of the movement of the inflowing gases; and a fluid-actuated mechanism for closing said valve device previously to the completion of the intake-stroke of the piston.

9. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the period of admission of gases to the cylinder; a fluid-actuated motor connected with said valve device; means for balancing the pressure on the moving element of the motor with an inflow of gas and for giving a preponderance of pressure to the closing side of the moving element of the motor to close the valve device; and means for changing said pressure on the moving element of the motor to close the valve before the completion of the intake-stroke of the piston.

10. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device for controlling the period of admission of gases; a fluid-actuated motor for actuating said valve device; means for subjecting one side of the moving element of the motor to the reduced pressure incident to the intake movement of the piston for closing the valve device; and a mechanism for making said means active before the completion of the intake-stroke of the piston.

11. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device for controlling the period of admission of gases therein; a fluid-actuated motor for operating said valve device; means for subjecting both sides of the moving element of the motor to atmospheric pressure during the inflow of gas and for subjecting one side of the moving element of the motor to the reduced pressure of the cylinder incident to the intake movement of the piston for closing the valve device; and means for effecting a change in pressure on the moving element of the motor to close the valve device before the completion of the intake movement of the piston.

12. In a mechanism compressing gases, the combination with the cylinder and compressing-piston therein; of a valve device arranged to control the period of admission of gases and for preventing an outflow of gas through the intake; means for closing said valve device, said means being subjected to the reduction of pressure incident to the motion-stroke of the compressing-piston and an opposing pressure; and mechanism controlling the application of the pressure so reduced by the motion-stroke of the piston to close the valve device during the motion movement of the piston.

13. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device for controlling the period of admission of gases, said valve device being arranged to open in the direction of movement of the inflow of gas; means for closing said valve device, said means being subjected to the reduction of pressure incident to the motion-stroke of the compressing-piston and an opposing pressure; and mechanism controlling the application of the pressure so reduced by the motion-stroke of the piston to open and close the valve.

14. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device for controlling the period of admission of gases to the cylinder, said valve device being arranged to open in the direction of movement of the inflow of gas; a fluid-actuated motor connected with said valve device; means for balancing the pressure of the moving element of the motor during the inflow of gas and for giving a preponderance of pressure to the closing side of the moving element of the motor to close the valve device.

15. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the

inflow of gases, said valve device being arranged to open in the direction of the movement of the inflowing gas; a fluid-actuated motor for actuating said valve device; and means for subjecting one side of the moving element of the motor to the reduced pressure in the cylinder incident to the intake movement of the piston for closing the valve device.

16. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve for controlling the inflow of gas, said valve device being arranged to open in the direction of movement of the inflowing gas; a fluid-actuated motor for operating said valve device; and means for subjecting both sides of the moving element of the motor to atmospheric pressure during the inflow of gas, and for subjecting one side of the moving element of the motor to the reduced pressure of the cylinder incident to the intake movement of the piston to close the valve device.

17. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the inflow of gas, said valve device being arranged to open in the direction of movement of the inflowing gas; a motor for actuating said valve device; means for subjecting the moving element of the motor to a reduced pressure of the cylinder; a valve for cutting off the supply of fluid furnishing the balance in pressure; means for subjecting one side of the moving element of the motor opposed to the closing movement of the valve to the reduced pressure of the cylinder incident to the intake movement of the piston for closing said valve.

18. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the inflow of gas; a fluid-actuated motor for operating said valve device; a connection through the valve between the cylinder and the side of the motor opposing the closing movement of the valve.

19. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the inflow of gas; a fluid-actuated motor for operating said valve device; a connection through the valve between the cylinder and the side of the motor opposing the closing movement of the valve; a passage leading from the side of the motor opposing the closing of the valve to the atmosphere; a valve device for controlling said passage; and means for actuating said valve to close said passage during the intake movement of the piston.

20. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the period of admission of gases; a fluid-actuated motor for operating said valve device; a connection between the cylinder and that side of the motor opposing the closing of the valve device; and a check-valve in said connection preventing the flow of gas from the cylinder to the side of the motor opposing the closing of the valve device.

21. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the inflow of gases; a motor controlling said valve device; a passage leading from the side of the motor opposing the closing of the valve to the atmosphere; a check-valve in said passage opposing the passage from the atmosphere to said motor; and permitting a passage of gas from said motor.

22. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the inflow of gas; a fluid-actuated motor for operating said valve device; a connection between the cylinder and that side of the motor opposing the closing of the valve device; a check-valve in said passage preventing a return of gas from the cylinder to said motor; a passage leading from said side of said motor to the atmosphere; a check-valve closing said passage and preventing a flow of air to said motor, but permitting a movement of air from said motor; a second passage from said side of said motor; and a valve controlling said passage.

23. In a mechanism compressing gases, the combination of the cylinder, A; the piston, B; inlet-passage, C; the valve, D, arranged in said passage; the stem, E, of said valve, having the passage, F, therethrough; the cylinder, G, having the passages, G', G'' and G''', to the atmosphere; the piston, H, arranged in said cylinder and secured to the stem, E'; the stem-valve, E'', in the passage, G'; a check-valve, J, arranged over the passage, G'; and the valve, I, arranged in the passage, G'.

24. In a mechanism compressing gases, the combination of the cylinder and compressing-piston therein; of a valve device controlling the period of admission of gases; means for closing said valve device, said means being subjected to the reduction of pressure incident to the motion-stroke of the compressing-piston, and an opposing pressure; and mechanism for controlling the application of the pressure so reduced to effect the action of said means at different points in the motion-stroke of the piston to vary the volume of gas compressed by the return stroke of the piston.

25. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the

period of admission of gases; means for opening and closing said valve device, said means being subjected to the reduction of pressure incident to the motion-stroke of the compressing-piston, and an opposing pressure; and mechanism controlling the application of the pressure so reduced for effecting an action of said means to open the valve during the initial movement of the piston and to close said valve at different points in the motion-stroke of the piston to vary the volume of gas compressed by the return stroke of the piston.

26. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device for controlling the period of admission of gases and for preventing an outflow of gas through the intake; a fluid-actuated mechanism for closing said valve device at different points in the intake-stroke of the piston to vary the volume of gas compressed by the return stroke of the piston.

27. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the inflow of gas to the cylinder; a fluid-actuated motor connected with said valve device; means for balancing the pressure on the moving element of the motor during an inflow of gas and for giving a preponderance of pressure to the closing side of the moving element of the motor to close the valve device; and means for varying the moment of the change in pressure on the respective sides of the moving element of the motor to vary the point in the intake-stroke at which the valve device is closed.

28. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the inflow of gas therein; a fluid-actuated motor for operating said valve device; means for subjecting both sides of the moving element of the motor to atmospheric pressure during an inflow of gas and for subjecting one side of the moving element of the motor to the pressure of the cylinder incident to the intake movement of the piston for closing the valve device; and means for varying the moment of subjecting the one side of the moving element of the motor to the reduced pressure to vary the point in the intake-stroke at which the valve device is closed.

29. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device for controlling the inflow of gases; a fluid-actuated motor for operating said valve device; means for subjecting the moving element of the motor opposed to the closing movement of the valve to a balancing pressure during an inflow of gases; a valve mechanism for cutting off the supply of fluid furnishing the balance of pressure; and means for subjecting the side of the moving element of the motor opposed to the closing movement of the valve device to the reduced pressure in the cylinder incident to the intake movement of the piston for closing said valve; and means for actuating said valve mechanism to vary the point of cutting off the supply of fluid furnishing the balance of pressure to vary the point in the intake movement of the piston at which the valve device is closed.

30. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the inflow of gases; a fluid-actuated motor for actuating said valve device; a connection between the side of the motor opposing the closing movement of said valve device and the cylinder; a passage from said side of the motor to the atmosphere; a valve controlling said passage; and means for actuating said valve at various points in the intake-stroke to vary the volume of gas admitted.

31. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the period of admission of gases; means for closing the said valve device, said means being subjected to the reduction of pressure incident to the motion-stroke of the compressing-piston and an opposing pressure; mechanism for controlling the application of the pressure so reduced to effect the closing of said valve device at various points in the motion-stroke of the piston; and a governor for controlling the point at which said mechanism acts.

32. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device for controlling the period of admission of gases and for preventing an outflow of gas through the intake; a fluid-actuated mechanism for closing said valve device at different points in the intake-stroke of the piston; and a governor for controlling the point at which the said closing mechanism is made active.

33. In a mechanism compressing gases, the combination with a cylinder and compressing-piston therein; of a valve device controlling the period of admission of gases therein; a fluid-actuated motor for operating said valve device; means for subjecting both sides of the moving element of the motor to atmospheric pressure during the inflow of gas and for subjecting one side of the moving element of the motor to the reduced pressure of the cylinder incident to the intake movement of the piston for closing the valve device; and a governor controlling the moment at which the one side of the motor is subjected to the cylinder-pressure to vary the moment of closing the valve device.

34. In a mechanism for compressing gases, the combination with a

42. In a gas-engine, the combination of a cylinder; the valve, D, controlling the inflow of gas thereinto; a field-actuated motor for operating said valve device; means for subjecting the side of the moving element of the motor opposed to the closing movement of the valve to a balancing-pressure during the inflow of gas; a valve mechanism for cutting off the supply of field furnishing the balance of pressure; means for subjecting the side of the moving element of the motor opposed to the closing movement of the valve device to the reduced pressure in the cylinder incident to the intake of the piston for closing said valve; and a governor for controlling the moment at which the said element of the motor is subjected to the pressure from the cylinder.

43. In a mechanism compressing gas, the combination with a cylinder and compressing-piston therein; of a valve device for controlling the inflow of gas thereinto; a motor connected with said valve device; a connection between the cylinder and that side of the motor opposed to the closing of the valve device; a passage from said side of the motor to the atmosphere; a valve controlling said passage; and a governor controlling said valve.

44. In a mechanism for compressing gas, the combination with a cylinder, A, and compressing-piston therein; of a valve, B, controlling the inflow of gas thereinto; a cylinder, G; a connection between the cylinder, G, and the cylinder, A; a check-valve in said connection; the piston, H, said piston being subjected to atmospheric pressure on the side toward the valve, D; the passage, G; a valve, I, controlling said passage; and a governor controlling the valve, I.

45. In a mechanism compressing gas, the combination with a cylinder, A, and compressing-piston therein; of a valve, D, controlling the inflow of gas thereinto; a cylinder, G; a connection between the cylinder, G, and the cylinder, A; a check-valve in said connection; the piston, H, said piston being subjected to atmospheric pressure on the side toward the valve, D; the passage, G; a valve, I, controlling said passage; and a governor mechanism controlling the valve, I, to open said valve during the initial movement of the piston and to close said valve at various points in the intake movement of the piston.

46. A governor comprising a reciprocating and rotating stem acting with the controlling element of the governor mechanism; a worm on said stem; a gear meshing said worm; a valve device, and means driven with said gear for controlling a valve device.

47. A governor comprising a reciprocating and rotating stem acting with the controlling element of the governor mechanism; a worm on said stem; a gear meshing said worm; a cam driven by said gear; and a valve device operated by the relative movement of said cam incident to the rotating movement of the worm, the action of the valve device being varied by a variation in the position of the cam due to an axial movement of said worm.

48. In a mechanism compressing gas, the combination with a cylinder and compressing-piston therein; a valve device controlling the inflow of gas; a governor mechanism comprising the worm, G, gear, H, cam, I, having the cam-curve, L, and shoulder, F; means operated by said cam for making active said valve device, said cam being arranged to effect the closing of said valve device during the intake movement of the piston and to vary the moment of closing by a relative variation in the position of the shoulder, F.

49. In a mechanism compressing gas, the combination of a cylinder and compressing-piston therein; a valve device controlling the inflow of gas thereinto; a field-actuated motor for operating said valve; the valve, I, for controlling said motor; a cam, L, for controlling the valve, I; a worm-gear operating with said cam; a worm having a relative and axial movement operating with the controlling element of the governor meshing said gear, and a governor.

50. In a mechanism compressing gas, the combination of the cylinder, A; the valve, D, controlling the inflow of gas thereinto; a cylinder, G; a connection between the cylinder, G, and the cylinder, A; the valve, I, controlling the inflow of the cylinder, G; the cam, L; means for communicating movement from the cam, L, to the valve, I; a worm-gear operating with said cam; a worm meshing said gear; a governor; means actuated with the controlling element of the governor for reciprocating said worm; and means for giving said worm relative movement.

51. In a gas-engine, the combination of a cylinder; the valve, D, controlling the inflow of gas thereinto; the air and gas valve carried with said valve; a motor operating upon said valve; a connection between the side of the motor opposed to the closing of the valve, D, and the cylinder; a passage leading from the said side of said motor to the atmosphere; a valve, I, controlling said passage; and means for closing said valve during an intake-stroke of the engine.

52. In a gas-engine, the combination of a cylinder; the valve, D; the air and gas valve carried with said valve; a motor operating upon said valve; a connection between the side of the motor opposed to the closing of the valve, D, and the cylinder; a passage leading from the said side of said motor to the atmosphere; a valve, I, controlling said passage; and means for closing said valve during an intake-stroke of the engine.

53. In a gas-engine, the combination of a cylinder; the valve, D; the air and gas valve carried with said valve; a motor operating upon said valve; a connection between the side of the motor opposed to the closing of the valve, D, and the cylinder; a passage leading from the said side of said motor to the atmosphere; a valve, I, controlling said passage; means for closing said valve, I, during an intake-stroke of the engine; and a governor for controlling the moment of the closing of the valve, I.

54. In a gas-engine, the combination with the cylinder, A; the valve, D, controlling the inflow of gas thereinto; the stem, J, extending therefrom; a passage, G, through said stem; a check-valve, G', in said passage; the air and gas valves, E and F, arranged on said stem; the cylinder, G, having the passage, G, G' and G'; the piston, H, arranged in the cylinder, G; the check-valve, J, on the passage, G; the valve, I, in the passage, G; and a governor mechanism controlling the valve, I.

597,410. VARIABLE-SPEED CHAIRING. LEONARD E. KNEE, Chayman, Wyo., assignor of two-thirds to Frederick W. Bredel and Gerhard T. Gubary, Chayman, Wyo. Filed May 27, 1901. Serial No. 68,072. (No model.)

Claim.—1. In a variable-speed chairing, the combination of a hub or stationary bearing provided with a locking-opening, an internal gear rotatably mounted thereon, a control gear also rotatably mounted upon the hub and provided with a pair of locking-openings, one of which is adapted to cooperate with the opening in the hub, a crank-arm mounted in said hub, a crank or lever fixed to the axle and provided with a locking-opening to cooperate with the other locking-opening in the control gear, a planetary gear carried by the lever and meshing with the internal and control gears, and a locking pin or screw interchangeable for insertion into either of the said two sets of locking-openings for rigidly connecting the control gear to the hub to adapt the internal gear to run at a higher rate of speed than the crank, or to rigidly connect the movable parts so as to adapt the internal gear to rotate with the crank at a corresponding rate of speed, substantially as set forth.

2. In a variable-speed chairing, the combination, with a stationary bearing and a crank-arm, of a rotatable internal gear, a rotatable control gear, an interposed planetary gear carried by the crank-arm, the said parts being provided with two sets of cooperative locking-openings, and a locking pin or screw interchangeable for insertion into either of said sets of openings, for in one instance, locking the control gear to the hub, and, in the other instance, locking the movable parts of the gearing, including said control gear together, substantially as described.

597,411. MACHINE FOR MAKING TWINE. LOUIS J. HENRIKSEN and CARLOS KUNKE, Chayman, Wyo., assignors of one-third to Fred H. Steiger, Fremont, Wyo. Filed Mar. 4, 1900. Serial No. 707,700. (No model.)

Claim.—1. In a machine for making twine, the combination, of a movable conveying mechanism, a rotatable part, fingers loosely hung on said rotatable part, said fingers adapted to engage and feed the material carried by the conveying mechanism, and an adjustable cam with which the fingers are adapted to make direct contact while said fingers are engaging the material.

2. In a machine for making twine, the combination, of a rotator, means for rotating the same, a tension-carrying shaft, a tension device carried thereby, a spool or thread carrying shaft, means for rotating the tension-carrying shaft, and means for rotating the spool or thread carrying shaft at a faster rate of speed than the tension-carrying shaft, said tension-carrying shaft and the spool or thread carrying shaft being rotated in the same direction with each other, but in a different direction from the rotator.

3. In a machine for making twine, the combination, of a tension-carrying shaft, a tension device carried by the shaft, said tension device consisting of a split collar engaging the shaft and adapted to be held thereby by friction, means for adjusting the friction of the collar, a thread-carrying shaft adapted to rotate about the tension-carrying shaft, and a spring-arm extending from the split collar, said arm adapted to carry and take the thread from the thread-carrying shaft.

4. In a machine for making twine, the combination, of means for forming lengths of material into twine, a bearing, a shaft journaled in said bearing, a spool of thread rotatably mounted on the shaft, and means for rotatably holding the bearing, whereby when the holding means is released the bearing can be adjusted further away from the twine-forming mechanism in order to permit of the removal of the spool and the substitution of a new spool.

5. In a machine for making twine, the combination, of means for forming the lengths of material into twine, a standard, a tension-carrying device and a spool-carrying device carried by the standard, an adjustable plate, a connection between the plate and the standard, and means for holding the plate in adjusted position, whereby the tension-carrying device and the spool-carrying device are brought closer to or further away from the twine-forming mechanism.

6. In a machine of the class described, a wrapping mechanism comprising a tubular shaft, the material to be wrapped arranged to pass longitudinally through said shaft, a tension device loosely mounted on said shaft and held thereby by friction, a thread-carrying shaft chucked upon the tension-carrying shaft, a thread or cord guide carried by the tension device, and means for adjusting the frictional engagement of the tension device with its shaft.

597,412. STRETCH-SPOOLER. ROBERT L. McFERRAN, Portsmouth, Va., assignor of one-third to Robert S. Marshall, Portsmouth, Va. Filed Dec. 24, 1901. Serial No. 57,100. (No model.)

Claim.—1. A syringe-needle comprising an outer perforated cylinder and an inner impervious core of smaller external diameter than the internal diameter of said cylinder and arranged concentrically within the latter, substantially as described.

2. A syringe-needle comprising an outer perforated cylinder and an inner impervious core of smaller external diameter than the internal diameter of said cylinder and arranged concentrically within the latter, and means for maintaining every portion of the periphery of said core at a uniform distance from the interior of said cylinder, substantially as described.

3. A syringe-needle comprising an outer hollow cylinder provided with a plurality of perforations located rearwardly and an inner impervious core of smaller external diameter than the internal diameter of said cylinder and arranged concentrically within the latter, substantially as described.

4. A syringe-needle comprising an outer perforated cylinder provided at one end with a perforated cap and at its other end with a nipple for introducing the cleansing fluid into said cylinder, and an inner impervious core of smaller external diameter than the internal diameter of said cylinder, and of less length than said cylinder, said core being arranged concentrically within the cylinder, and means for maintaining every part of the exterior of said core out of contact with the interior of the cylinder and its cap, substantially as described.

5. A syringe-needle comprising an outer perforated cylinder and an inner impervious core of smaller external diameter than the internal diameter of said cylinder, and arranged within the latter, and projections on the periphery of said core arranged to loosely engage the interior of the cylinder and hold said core concentrically within the cylinder, substantially as described.

6. A syringe-needle comprising an outer perforated cylinder, provided at one end with a perforated cap and at its other end with a nipple for the introduction of a cleansing fluid, of an inner impervious core of smaller external diameter than the internal diameter of said cylinder and arranged within the latter and loosely projecting past the periphery of said core and loosely engaging the interior of the perforated

cylinder, said pipe operating to hold the core concentrically in the cylinder, substantially as described.

7. A syringe-needle comprising an outer perforated cylinder, provided at one end with a rounded perforated cap and at its other end with a nipple for the introduction of a cleansing fluid, a hollow inner impervious core rounded at its opposite ends, and of less length and diameter than the inner diameter of the cylinder and cap, and projections on the periphery and forward end of said core for holding the latter out of contact with the interior of both the cylinder and cap, substantially as described.

8. A syringe-needle comprising an outer perforated cylinder laterally threaded at its opposite ends, a hollow rounded, perforated cap screwed in one end of said cylinder, a nipple for the introduction of a cleansing fluid screwed in the opposite end of said cylinder and a removable impervious core, rounded at its opposite ends, and of less diameter externally than the internal diameter of said cylinder and cap and removably arranged within said cylinder, and projections on the periphery and forward end of said core for holding the latter out of contact with the interior of the cylinder and cap, substantially as described.

597,413. LATH-PAN REVER. HENRY C. GUNTER, Cleveland, Ohio, assignor to American Gun Co., Cleveland, Ohio, a Partnership. Filed Mar. 22, 1901. Serial No. 68,500. (No model.)

Claim.—1. In lath-pan, a removable frame, a removable member thereon, means for raising and lowering the same, and a reversible member in combination with removable receptacles supported by the reversible member, substantially as set forth.

2. In lath-pan, in combination, a frame, and members rotatably mounted thereon, each connecting said and members, means adapted to be suspended from said rods, one of said and members having a longitudinal web and a handle pivoted to said frame and having a bifurcated part which may engage said web, substantially as set forth.

3. In lath-pan, in combination, a trough adapted to be formed of sheet metal, and plates having grooves into which the ends of said trough fit, and the rods passing through said and plates, substantially as set forth.

4. In lath-pan, in combination, a trough adapted to be formed of sheet metal, and plates having heels, and the rods passing through said and plates and adapted to hold said trough in position, substantially as set forth.

5. In lath-pan, in combination, a trough adapted to be formed of sheet metal, and plates having grooves into which the ends of said trough fit, said and plates having ears which project to a point lower than the bottom of said trough, and the rods which pass through said and, substantially as set forth.

6. In lath-pan, the combination of a central trough portion, and plates having hand-openings formed thereon and means for holding the parts in assembled relation, substantially as set forth.

7. In lath-pan, the combination of a central trough portion, and plates having deep projections formed thereon, and means for holding the parts in assembled relation, substantially as set forth.

597,414. AIR-COMPRESSOR. FRANK L. KENNEDY and ALBERT R. FRYVILL, Louisville, Ky., assignors to the National Foundry and Machine Company, Louisville, Ky., a Corporation. Filed Feb. 6, 1901. Serial No. 68,500. (No model.)

Claim.—1. In an air-compressor, the combination with the taper threaded valve-chamber, having an annular interior groove, and a passage connecting chamber and cylinder, of a taper-threaded double valve-seat having a projecting threaded end portion, the valve in said chamber, and the threaded plug engaging a threaded opening in the end wall of the valve-seat chamber, substantially as specified.

2. An air-compressor having valve-chambers at each end of the cylinder thereof, and having passages connecting each end of the cylinder

with said chambers, and having a passage connecting said chambers, said chambers having each an interior annular groove registering with the passage connecting chamber and cylinder, and integral double valve-seat bushings having a tapered threaded engagement with said chambers, said bushings having perforations registering with said interior grooves, and having portions thereof projecting from the chambers, the valves in said bushings and jaw-sets engaging said projecting portions of the bushings and having air-inlet perforations, substantially as specified.

2. An air-compressor having valve-chambers at each end of the cylinder thereof, and having passages connecting each end of the cylinder with said chambers, and having a passage connecting said chambers, said chambers having each an interior annular groove registering with the passage connecting chamber and cylinder, and integral double valve-seat bushings having a tapered threaded engagement with said chambers, said bushings having perforations registering with said interior grooves, and having portions thereof projecting from said chambers, the valves in said bushings, jaw-sets engaging the projecting portions of said bushings, and having air-inlet perforations, and cover-plates engaging perforations of the said walls of said chambers, substantially as specified.

697,415. LAW-MOWER. CHARLES R. SMITH, Bismarck, N. Dak., assignor of one-half to S. H. Smith, Ostriville, N. Dak. Filed Dec. 27, 1901. Serial No. 57,002. (No model.)

Claim.—1. A law-mower comprising a base-plate formed with fingers, and a cap or gear-riding formed with coating aligned fingers, a drive-shaft journaled in said casing, traction-wheels mounted upon said drive-shaft and arranged within the sides of the casing, a rotary disk journaled between said gear-riding and base-plate and adapted to rotate with its blades between the casing fingers, and an intermediate gearing connecting the drive-shaft with said rotary disk, substantially as set forth.

2. A law-mower comprising a base-plate formed with a segmental row of guard-fingers and with a circular recess, and a cap or gear-riding connected to the base-plate and provided with sliding guard-fingers, a drive-shaft journaled in the cap or gear-riding, traction-wheels fixed to said shaft within the sides of the casing, a rotary disk mounted in the recess of said base-plate, and a pin of gearing for transmitting the movement of the drive-shaft to said rotary disk, substantially as set forth.

3. A law-mower comprising a base-plate formed at its forward end with a segmental row of guard-fingers and with an annular recess having a concentric annular groove, and a cap or gear-riding secured to the base-plate, a drive-shaft journaled in said cap or gear-riding, traction-wheel fixed to said drive-shaft, a rotary disk seated in said annular recess and having an annular rib to engage the annular groove, and an intermediate gearing for transmitting movement from the drive-shaft to the rotary disk, substantially as set forth.

4. A law-mower comprising a base-plate provided with guard-fingers and having near its rear end and at its side parallel longitudinal slots or openings, a cap or gear-riding secured to said base-plate and provided with sliding guard-fingers, a transverse shaft journaled in said cap or gear-riding, traction-wheels fixed to said shaft and projecting through the longitudinal slots or openings in the base-plate, a rotary disk, and means for transmitting movement from the drive-shaft to the rotary disk, substantially as set forth.

5. A law-mower comprising a base-plate provided with guard-fingers and having near its rear end and at its side parallel longitudinal slots or openings, a cap or gear-riding secured to said base-plate and provided with sliding guard-fingers, a central chamber, side chambers, a transverse shaft journaled in the side plates of said cap or gear-riding, a counter-shaft arranged at right angles to the transverse shaft and located within the central chamber, traction-wheels fixed to said shaft and rotating in the side chambers and projecting through the longitudinal slots or openings in the base-plate, a beveled gear fixed to said transverse shaft, beveled gears fixed to said counter-shaft, one in mesh with the aforesaid beveled gear, and a rotary disk having a fixed beveled gear in mesh with the forward beveled gear of the counter-shaft, substantially as set forth.

697,416. NUT-LOCK. WILLIAM S. FOTHERGLASS, Chelsea, Ind. Ter. assignor of one-half to David S. Elliott, Chelsea, Ind. Ter. Filed Nov. 23, 1901. Serial No. 52,641. (No model.)

Claim.—1. The combination with a bolt and nut, of a lock comprising a washer, a locking device that projects from the washer and engages both the nut and bolt to hold them against relative movement, and a holding device that engages the bolt to hold said washer against longitudinal displacement.

2. The combination with a bolt and nut, of a lock comprising a washer, a locking device projecting from one side of the washer, said locking device engaging both the nut and bolt to hold them against relative movement, and a holding device projecting from the side of the washer opposite the locking device and engaging the bolt to hold said washer against longitudinal displacement.

3. The combination with a bolt and nut, having slots adapted to be placed in alignment, of a lock comprising a washer having a locking-clip that engages in the aligned slots of the nut and bolt to hold them against relative movement, and a holding device carried by the washer and engaging the bolt to hold it against longitudinal displacement upon said bolt.

4. The combination with a bolt and nut having slots adapted to be placed in alignment, of a lock comprising a washer having a locking-clip that engages in the aligned slots of the nut and bolt to hold them against relative movement, and a bendable holding-clip carried by the washer and arranged to engage the threads of the bolt to hold said washer against longitudinal displacement.

5. The combination with a bolt and nut having slots in their opposite faces, the slots of said nut being adapted to align with the corresponding slots of the bolt, of a lock comprising a washer having a pair of oppositely-disposed locking-arms that engage in the aligned slots of the nut and bolt to hold them against relative movement, and a pair of oppositely-disposed holding-lugs carried by the washer and projecting from the side opposite the locking-arms, said holding-lugs engaging the bolt-threads to hold the washer against longitudinal displacement.

697,417. GOLF-BALL. BRADSHAW KIMBALL, Boston, Mass., assignor to the Kimball Manufacturing Company, a Corporation of New Jersey. Filed July 27, 1900. Serial No. 20,000. (No model.)

Claim.—A playing-ball provided with three diametrical perforations at right angles to each other.

697,418. GOLF-BALL. BRADSHAW KIMBALL, Boston, Mass., assignor to the Kimball Manufacturing Company, a Corporation of New Jersey. Filed Sept. 28, 1901. Serial No. 70,001. (No model.)

Claim.—1. A playing-ball having a stiff, springy shell formed of plastic material, an elastic cushion, and an intervening independent layer of fibrous material; said shell holding said cushion under compression.

2. A playing-ball comprising a shell formed from plastic material, and a springy cushion held under compression by said shell; said cushion being wound around with fibrous strips so as to form an independent layer.

3. A playing-ball consisting of a solid nucleus of springy material which is overwound with twine, and a shell of plastic material holding said nucleus under compression.

4. A playing-ball comprising a core of yielding material, an independent flexible tough fibrous jacket thereon, and a shell of plastic material compressed upon said jacket.

5. A playing-ball comprising a core of gutta-percha overwound with linen twine, and a shell of plastic material holding said core under compression.

6. A playing-ball comprising a yielding core, an independent tough flexible fibrous layer thereon, and a shell of plastic material compressed upon said layer and core.

7. The combination of a core consisting largely of gutta-percha, an independent layer of fibrous material covering said core, and a casing of celluloid compressed upon the fibrous material and core.

8. A playing-ball having a yielding core and a celluloid shell which is reinforced with an independent layer of fibrous material, said shell holding said core under compression.

9. A playing-ball having a core which consists largely of gutta-percha, fibrous material wound upon said core and forming an independent layer, and a celluloid shell compressed upon said fibrous material and core.

10. A playing-ball having a yielding core overwound with strips of fibrous material, and a shell of plastic material consisting of segments welded at their edges and holding said core under compression.

11. A playing-ball having a core which consists largely of gutta-percha, and a celluloid shell reinforced by an independent layer of fibrous material and consisting of spherical segments which are welded together at their edges and hold said core under compression.

12. A playing-ball comprising a shell consisting of hemispherical sections welded together at their edges, and a filling of springy material having an independent tough, flexible jacket of fibrous material and held under compression by said shell.

13. A playing-ball comprising a shell which consists of hemispherical segments of celluloid welded together at their edges, and a spherical filling of gutta-percha covered with twine and held under compression by said shell.

14. A ball consisting of a solid sphere of gutta-percha wound compactly with several layers of hard-twisted linen twine, and held under compression by a relatively thin celluloid shell.

697,419. GOLF-BALL. BRADSHAW KIMBALL, Boston, Mass., assignor to the Kimball Manufacturing Company, a Corporation of New Jersey. Filed Oct. 10, 1901. Serial No. 70,000. (No model.)

Claim.—1. A playing-ball comprising a springy core, windings of fibrous material thereon, and a shell formed of plastic material and held

ing said fibrous material and said core under compression; said fibrous material being permeated with adhesive material.

2. A playing-ball comprising a springy core, several layers of fibrous material wound around said core, a shell consisting of segments of plastic material welded at their edges and holding said fibrous material and said core under compression, and adhesive material uniting said shell to said fibrous material.

3. A playing-ball comprising a filling consisting at least partially of gutta-percha; windings of twine thereon; a shell formed of plastic material and compressed upon said twine and core; and an adhesive substance between said twine and said shell.

4. A playing-ball comprising a springy core, windings of fibrous material thereon, and a celluloid shell compressed upon said fibrous material and holding said core under compression.

5. A playing-ball comprising a springy core and a shell of celluloid compressed thereon; said core being covered with fibrous material which is independent of said layer and also independent of said shell, and said shell being cemented to said fibrous layer.

6. A playing-ball comprising a springy core, a layer of fibrous material thereon, and a shell formed of plastic material and holding said core under compression; said shell consisting of one set or pair of spherical segments welded at their edges, and said fibrous material being also joined to said shell by adherent material.

7. A playing-ball comprising a gutta-percha core, a layer of fibrous material thereon, and a shell formed from plastic material and holding said core under compression; said shell consisting of a single pair of hemispherical segments welded at their edges, and said fibrous material being also joined to said shell by adherent material.

8. A playing-ball comprising a springy core, a layer of fibrous material thereon, and a celluloid shell holding said core under compression; said shell consisting of a single pair of spherical segments welded at their edges, and said fibrous material being also joined to said shell by adherent material.

9. A playing-ball comprising a core consisting at least partially of gutta-percha, a layer of fibrous material upon said core, and a shell formed of celluloid and holding said core under compression; said shell consisting of a single pair of hemispherical segments welded at their edges, and said fibrous material being also joined to said shell by adherent material.

10. A playing-ball comprising a springy core, windings of cord thereon, and a shell holding said core under compression; said shell being formed of segments of plastic material which are welded at their edges, and said cord being cemented to said shell.

11. A playing-ball comprising a springy cord overwound with cord and a shell of plastic material formed of segments of plastic material welded at their edges and holding said core under compression; said cord being embedded in plastic material of the same nature of that from which the shell is formed, and whereby said cord is firmly joined to said shell.

697,420. GOLF-BALL. BRADSHAW KIMBALL, Boston, Mass., assignor to the Kimball Manufacturing Company, a Corporation of New Jersey. Filed Oct. 10, 1901. Serial No. 70,011. (No model.)

Claim.—1. A playing-ball consisting of a solid nucleus of springy material which is overwound with rope fiber, and a shell of plastic material holding said nucleus under compression.

2. A playing-ball comprising a core of gutta-percha overwound with rope fiber and a shell of plastic material holding said core under compression.

3. A playing-ball comprising a yielding core, rope fiber wound thereon, and a celluloid shell compressed upon said layer.

4. The combination of a core consisting largely of gutta-percha, rope fiber covering said core, and a casing of celluloid compressed thereon.

5. A playing-ball having a core which consists largely of gutta-percha, rope fiber wound upon said core, and a celluloid shell compressed upon said fibrous material.

6. A playing-ball having a yielding core overwound with rope fiber, and a shell of plastic material consisting of segments welded at their edges and holding said core under compression.

7. A playing-ball comprising a shell consisting of hemispherical segments welded together at their edges, and a filling of springy material having a jacket of rope fiber and held under compression by said shell.

8. A playing-ball comprising a shell which equals of hemispherical segments of celluloid welded together at their edges, and a spherical filling of gutta-percha covered with rope fiber and held under compression by said shell.

9. A ball consisting of a solid sphere of gutta-percha wound compactly with several layers of rope fiber and held under compression by a relatively thin celluloid shell.

697,421. GOLF-BALL. BRADEN KEMPWALL, Boston, Mass., assignor to the Kempwall Manufacturing Company, a Corporation of New Jersey. Filed Nov. 5, 1901. Serial No. 51,565. (No model.)

Claim.—1. The combination with a springy core of windings of elastic tubing tensioned thereon, and a shell formed from plastic material and holding said core under compression.

2. The combination with a core made of windings of rubber thread of elastic tubing tensioned thereon, and a shell formed of plastic material and compressed upon said tubing and core.

3. The combination with a rubber-thread ball of a celluloid shell holding the same under compression.

4. The combination with a rubber-thread ball of a shell consisting of hemispherical segments of celluloid welded together at their edges and holding said ball under compression.

5. A playing-ball comprising a celluloid shell, a rubber core, and an intervening layer of fibrous and elastic material, said core being held under compression by said shell.

6. A playing-ball comprising a celluloid shell, a rubber core, and an intervening layer of fibrous and elastic material; said core being held under compression by said shell, and said shell consisting of hemispherical segments welded together at their edges.

7. A playing-ball comprising a celluloid shell, a rubber core, and an intervening layer of fibrous and elastic material; said core being held under compression by said shell, and said fibrous material being cemented to the latter.

8. A playing-ball comprising a celluloid shell, a rubber core, and an intervening layer of fibrous and elastic material; said core being held under compression by said shell, said shell consisting of hemispherical segments welded together at their edges, and said fibrous material being cemented to said shell.

9. A playing-ball comprising a shell made from plastic material, a core formed from springy material, and an intervening layer of tensioned elastic fabric; said core being held under compression by said shell.

10. The combination of a rubber core, windings of elastic tubing tensioned thereon, and a shell of celluloid; the latter holding said core under compression.

11. In a playing-ball, a nucleus consisting of an elastic substance over which elastic tubing is tensioned.

12. In a playing-ball, a nucleus consisting of a ball made up of windings of tensioned rubber thread over which elastic tubing is tensioned.

13. The combination of a springy core, elastic tubing tensioned thereon, and a hard shell formed from plastic material; said tubing being cemented to said shell and the latter holding said core under compression.

14. A playing-ball comprising a springy filling, a celluloid shell and an intervening elastic layer under tension; said shell holding said layer and said filling under compression.

15. A playing-ball comprising a springy filling, a celluloid shell, and an intervening elastic layer under tension; said shell holding said layer and said filling under compression, and being formed from hemispherical segments which are welded together at their edges.

697,422. GOLF-BALL. BRADEN KEMPWALL, Boston, Mass., assignor to the Kempwall Manufacturing Company, a Corporation of New Jersey. Filed Jan. 16, 1902. Serial No. 52,005. (No model.)

Claim.—1. A playing-ball comprising an elastic core and a celluloid shell, the exterior portion of the shell being well cured and the interior portion thereof being incompletely cured and compressing the core directly to said exterior, and the shell being compressed upon the core and holding the same under compression.

2. A playing-ball comprising an elastic core and a shell built up of celluloid layers, the outer layer being thin and highly cured and compressed or welded upon the inner layer, and the latter being incompletely cured and adhering to all portions of the surface of the core.

3. A playing-ball comprising an elastic core, and a shell compressed thereon; said shell comprising a highly tensioned or cured outer layer of celluloid and a lining of incompletely-cured celluloid adjacent to the core.

4. A playing-ball comprising an elastic core enveloped or incased in fabric and celluloid, a portion of the celluloid upon the exterior of the ball being highly cured, and an interior portion thereof being incompletely cured; and said fabric being embedded in the celluloid adjacent to the core.

5. A playing-ball comprising an elastic core enveloped or incased in elastic tubing and celluloid, a portion of the celluloid upon the exterior of the ball being highly cured, and an interior portion thereof being incompletely cured; and said elastic tubing being embedded in the celluloid.

6. A playing-ball comprising a core of elastic thread wound under tension; elastic tubing covering said core; tensioned celluloid segments incasing and incorporated with said covering; and segments of highly-tensioned celluloid incasing said tensioned celluloid; said segments being welded together at their edges and also welded thereto to said tensioned celluloid; and said elastic core being held under compression by said celluloid shell.

697,423. MANUFACTURE OF GOLF-BALLS. BRADEN KEMPWALL, Boston, Mass., assignor to the Kempwall Manufacturing Company, a Corporation of New Jersey. Filed Feb. 14, 1902. Serial No. 54,000. (No model.)

Claim.—1. A process in producing playing-balls, consisting in incasing a core or filling in a layer of incompletely-cured celluloid, and compressing a shell of highly tensioned or cured celluloid thereon.

2. A process in producing playing-balls, consisting in incasing a core or filling with a shell consisting of a plurality of layers, at least one of said layers being incompletely-cured celluloid, and at least one other of said layers including said layer and consisting of highly-tensioned celluloid, and causing said layers to unite or weld by means of heat and compression.

3. A process in producing playing-balls, consisting in incasing a springy core or filling within a shell consisting of a plurality of layers, at least one of said layers consisting of incompletely-cured celluloid, and at least one other of said layers including said layer and consisting of highly-tensioned celluloid, and subjecting said layers to heat and compression sufficient to join or weld said layers and put said core or filling under compression.

4. A process in producing playing-balls, consisting in incasing a springy core or filling within a shell consisting of a plurality of layers, at

least one of said layers consisting of incompletely-cured celluloid, and at least one other of said layers including said layer and consisting of highly-tensioned celluloid, subjecting said layers to heat and compression sufficient to join or weld said layers and put said core or filling under compression, and maintaining the compression while the shell hardens.

5. A process in producing playing-balls, consisting in incasing a layer of incompletely-cured celluloid upon a springy core or filling, incasing the ball then formed in a shell consisting partially or wholly of highly-tensioned celluloid, heating and compressing the ball then formed, and continuing the compression while the shell hardens.

6. A process in producing playing-balls, consisting in covering a core with layers of celluloid and fabric; at least two layers of celluloid being employed, and the outer layer thereof being more tensioned than the inner layer; subjecting the ball then assembled to heat and compression, and continuing the compression while the shell hardens.

7. A process in producing playing-balls, consisting in covering a core with previously-formed layers of celluloid and causing said layers to join or weld under heat and compression.

8. A process in producing playing-balls, consisting in covering a springy core with a layer of fabric and layers of celluloid and causing all of said layers to unite under heat and compression.

9. A process in producing playing-balls, consisting in heating and compressing well-cured and incompletely-cured celluloid upon a springy core and causing the compression to be continued while the shell hardens.

10. A process in producing playing-balls consisting in winding elastic tubing upon a springy core, cementing said tubing, including the ball core in a shell consisting of layers of celluloid, and subjecting the ball then assembled to heat and compression.

11. A process in producing playing-balls, consisting in forming a hard, springy core with a tensioned elastic jacket, and compressing heated layers of highly-tensioned and incompletely-cured celluloid thereon.

12. A process in producing playing-balls, consisting in solidifying under heat and pressure a springy core, a tensioned elastic jacket upon said core, and layers of celluloid incasing said jacket.

13. A process in producing playing-balls, consisting in compressing linear and outer shell-segments over a filling previously prepared with a tensioned elastic compression-jacket.

14. A process in producing playing-balls, consisting in incasing within laminated shell-segments of highly-tensioned and incompletely-cured celluloid an elastic core having a compression-jacket under tension, heating and forcing the segments together, causing their edges to weld or adhere, and causing the shell to harden while under compression.

15. A process in producing playing-balls, consisting in winding elastic tubing under tension upon a springy core, incasing the ball then formed in a laminated celluloid shell, and subjecting the whole to compression and heat.

16. A process in making playing-balls, consisting in making a core of rubber, providing the same with a covering consisting of fabric and layers of celluloid, subjecting the whole to heat and compression, and continuing the compression while the shell hardens.

17. A process in making playing-balls, consisting in making a core of rubber, providing the same with a covering consisting of elastic tubing and layers of celluloid, subjecting the whole to heat and compression, and continuing the compression while the shell hardens.

18. A process in producing playing-balls, consisting in winding rubber thread under tension into the form of a ball, winding elastic tubing under tension upon said ball, incasing the ball then formed in layers of incompletely-cured and well-cured celluloid, and subjecting the whole to compression and heat.

19. A process in producing playing-balls, consisting in incasing a core or filling in a layer of incompletely-cured celluloid, compressing segments of highly tensioned or cured celluloid thereon and welding said segments together.

20. A process in producing playing-balls, consisting in incasing a core or filling with a shell consisting of a plurality of layers, at least one of said layers being in the form of segments of incompletely-cured celluloid, and at least one other of said layers including said layer and consisting of segments of highly tensioned celluloid, and causing all of said segments to weld together by means of heat and compression, so as to form an entire shell.

21. A process in producing playing-balls, consisting in incasing a springy core or filling within a shell consisting of a plurality of layers, at least one of said layers consisting of incompletely-cured celluloid, and at least one other of said layers including said layer and consisting of segments of highly-tensioned celluloid, subjecting said layers to heat and compression sufficient to join or weld said layers and weld said segments at their edges and also put said core or filling under compression, and maintaining the compression while the shell hardens.

22. A process in producing playing-balls, consisting in incasing a layer of incompletely-cured celluloid upon a springy core or filling, incasing

the ball then formed in segments consisting partially or wholly of highly-tensioned celluloid, heating and compressing the ball then formed, and continuing the compression while the shell hardens.

23. A process in producing playing-balls, consisting in covering a core with layers of celluloid and fabric; at least two layers of celluloid being employed, and the outer layer thereof consisting of hemispherical segments and being more tensioned than the inner layer; subjecting the ball then assembled to heat and compression; and continuing the compression while the shell hardens.

24. A process in producing playing-balls, consisting in covering a core with previously-formed layers of celluloid each layer being in the form of segments, and causing said layers to join or weld together and said segments to weld at their edges under heat and compression.

25. A process in producing playing-balls, consisting in heating and compressing and welding well-cured segments and incompletely-cured segments of celluloid upon a springy core and causing the compression to be continued while the shell hardens.

26. A process in producing playing-balls consisting in winding elastic tubing upon a springy core, cementing said tubing, including the ball core in segments of celluloid, incasing the ball then formed in other segments of celluloid, and subjecting the ball then assembled to simultaneous heat and compression.

27. A process in producing playing-balls, consisting in forming a hard, springy core with a tensioned elastic jacket, and heating and compressing highly-tensioned segments and incompletely-cured segments of celluloid thereon.

28. A process in producing playing-balls, consisting in solidifying under heat and pressure a springy core, a tensioned elastic jacket upon said core, and layers of celluloid in segmental form incasing said jacket.

697,424. GOLF-BALL. BRADEN KEMPWALL, Boston, Mass., assignor to the Kempwall Manufacturing Company, a Corporation of New Jersey. Filed Feb. 24, 1902. Serial No. 55,100. (No model.)

Claim.—1. In a playing-ball, the combination with a yielding core of a shell compressed thereon, said shell comprising an inner layer and an outer layer of well-cured or cured celluloid and an intervening layer of more plastic celluloid which welds together said inner and outer layers.

2. In a playing-ball, the combination with a yielding core of a shell compressed thereon, said shell comprising an outer layer of well-cured celluloid, and an inner layer of hard, springy material welded or adhering thereto.

3. In a playing-ball, the combination with a yielding core of a shell compressed thereon, said shell comprising an outer layer of well-cured celluloid, an inner layer of hard springy material, and an intervening layer or plenum of cementing or welding material.

4. In a playing-ball, the combination of a springy core, a layer of well-cured celluloid thereon, a coating of more plastic celluloid upon said layer, and welded segments of celluloid compressed upon and united by said plastic coat to said first layer; the shell then formed holding said core under compression.

5. In a playing ball, the combination of a springy core, segments of well-cured celluloid thereon, a coating of more plastic celluloid upon said segments, and segments of well-cured celluloid united by said plastic celluloid to said inner segments; all of said segments being also welded at their edges and holding said core under compression.

6. In a playing-ball, the combination with a yielding core of a shell compressed thereon, said shell being made up of hard layers united by a cementing-layer, one of said hard layers being formed of joined spherical segments, and another of said layers reinforcing the joint.

7. In a playing-ball, the combination with a yielding core of a shell compressed thereon, said shell comprising a plurality of hard layers cemented one upon the other; one of said layers being in the form of edge-welded hemispherical segments, and another of said layers reinforcing the weld.

8. In a playing-ball, the combination of a yielding core and a celluloid shell holding said core under compression; said shell comprising inner and outer layers, each of said layers consisting of segments welded together, and the weld in one of said layers running crosswise of the weld in the other thereof, and also comprising an intervening adherent or welding layer or film.

9. In a playing-ball, the combination with a yielding core, of a shell consisting wholly or partly of celluloid and having said core under compression; said shell consisting of layers, at least one whereof is in the form of segments welded together, and another of said layers reinforcing the weld; said layers being also compressed and welded together so as to form an intervening adherent layer.

10. A playing-ball comprising a core consisting wholly or largely of gutta-percha, and a shell consisting wholly or largely of celluloid and made up of an outer layer, an inner layer, each of said layers consisting of hemispherical segments welded together, the welds running crosswise of each other, and an intervening layer; and said outer and inner layers being solidified and welded together upon said intervening layer so as to form a concrete shell, which holds said core in a state of compression.

11. In a playing-ball, a shell made up of layers, one of said layers being formed of jointed spherical segments, another of said layers reinforcing the joint, and a layer intervening between said layers; and a yielding core held under compression by said shell.

12. In a playing-ball, a shell comprising two layers, each comprising jointed spherical segments, the joint or seam in one layer running crosswise with the joint or seam in the other layer, and also comprising an intervening weld-layer; and a yielding core held under compression by said shell.

697,425. MANUFACTURE OF GOLF-BALLS. BRADLEY KEMP-
SHALL, Boston, Mass., assignor to the Kempshall Manufacturing Com-
pany, a Corporation of New Jersey. Filed Mar. 6, 1902. Serial No.
56,502. (No model.)

Claim.—1. A process in producing playing-balls, consisting in providing a core with a thick solid rubber envelop and forming thereon under heat and pressure a shell of gutta-percha and celluloid.

2. A process in producing a playing-ball, consisting in providing a core of gutta-percha with a solid rubber envelop and heating and compressing thereon a shell consisting partially or wholly of celluloid and gutta-percha.

3. A process in producing a playing-ball, consisting in compressing a body of soft rubber between a hard core and a multiple-layer shell while the latter is in a plastic condition, and causing said shell to harden while compressed, thereby to hold said rubber under permanent compression.

4. A process in forming a playing-ball, consisting in providing a spherical gutta-percha core with a highly-vulcanized firm rubber envelop, compressing upon said envelop a heated shell of gutta-percha and celluloid, and causing said shell to harden while under compression.

5. A process in forming a playing-ball, consisting in providing a spherical gutta-percha core with a highly-vulcanized firm rubber envelop, compressing upon said envelop a heated shell of gutta-percha and celluloid, and causing said shell to harden while under compression.

6. A process in forming a playing-ball, consisting in combining a spherical core of hard material with a thick rubber envelop, providing said envelop with a hard shell, compressing upon said shell heated segments of celluloid, and causing said celluloid to harden while under compression.

7. A process in forming a playing-ball, consisting in combining a spherical core of hard material with a highly-vulcanized thick rubber envelop, compressing upon said envelop heated hemispherical segments of gutta-percha and celluloid, so as to compress and weld said segments and also place said rubber under compression, and causing the gutta-percha and celluloid to harden while under compression.

8. A process in producing playing-balls, consisting in compressing a plastic shell consisting of gutta-percha and celluloid upon a soft-rubber and gutta-percha filling so as to put said rubber in a state of compression, and hardening said shell while under compression.

9. A process in producing playing-balls, consisting in heating a previously-formed gutta-percha and celluloid shell and compressing it upon a sphere of soft rubber which contains a core of gutta-percha.

10. A process in making playing-balls, consisting in heating and pressing celluloid and gutta-percha shell-segments together over a soft-rubber sphere containing a core of gutta-percha, so as to compress the

soft rubber and also to cause the edges of the shell-segments to unite or weld, and hardening the shell while under compression.

11. A process in making playing-balls, consisting in placing a gutta-percha sphere between hemispheres of soft rubber, pressing hot gutta-percha and celluloid shell-segments together over said filling so as to cause the edges of the segments to unite, to compress the soft rubber and also to compress the shell to final size, and causing the shell to harden while under compression.

12. A process in making playing-balls, consisting in making a filling at least partially of gutta-percha and highly-vulcanized soft rubber, making hemispherical gutta-percha and celluloid shell-segments, heating and compressing the segments over the filling, so as both to compress the latter and also to cause the edges of the segments to weld or unite, the joints or welds crossing, and hardening the shell while under compression.

13. A process in making playing-balls, consisting in inclosing a soft-rubber sphere in a shell of gutta-percha, putting the ball thus formed in a shell of celluloid, subjecting the ball thus formed to heat and compression, and maintaining the compression until the celluloid and gutta-percha harden.

14. A process in making playing-balls, consisting in inclosing a soft-rubber sphere in a shell of gutta-percha, putting the ball thus formed between segments of celluloid, subjecting the ball thus formed to heat and compression, so as to weld said segments and compress said rubber, and maintaining the compression until the celluloid and gutta-percha harden.

REISSUES.

11,980. MACHINE FOR MOUNTING ORNAMENTAL COMPOSITION DIRECTLY UPON CIRCULAR PICTURE-FRAMES. FRANK E. ADAMS, Chicago, Ill., assignor to Samuel Franklin, Chicago, Ill. Filed Jan. 29, 1902. Serial No. 11,984. Original No. 646,589, dated Jan. 29, 1901. Reissue No. 11,980, dated Oct. 22, 1901.

Claim.—1. In a machine for directly mounting ornamental composition on frames, the combination, with a support provided with an impression-roller and means for operating the same, of two tables on the support, each of which is provided with a slot, two bolts in each slot, two cross-pieces between the tables, the ends of which extend under the slots and engage with the bolts, a guide projecting from the central portion of each cross-piece above the tops of the tables, and a wheel journaled between the tables and the cross-pieces, the axis of which is substantially in alignment with the guides and the periphery is provided with teeth and projects above the tops of the tables.

2. In a machine for directly mounting ornamental composition on frames, the combination, with a support provided with an impression-roller and means for operating the same, of two tables on the support, the adjacent edges of which are parallel, each table being provided with a slot, parallel with its edge and having a portion of its top around the slot cut away, two cross-pieces between the tables, each end of each of which is halved and extends under the table and the top fits squarely between the tables and is even with the tops thereof, a bolt through each end of each cross-piece, the head of which fits within the recessed portion of the table and the bolt clamps the cross-piece against the under side of the table, a roller journaled at the central portion of each cross-piece so as to project above the tops of the tables, and a roller journaled between the tables and the cross-pieces, the axis of which is substantially in alignment with the rollers on the cross-pieces and the periphery projects above the tops of the tables and is provided with teeth.

3. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein upon a horizontally-disposed axis, an impression-roll disposed above said feed-roll and journaled in said

frame in a vertically-movable bearing, a guide located upon each side of the feed-roll at its upper part and both of said guides being located in a vertical plane extending through and parallel with the axis of both of said rolls, said feed-roll being removable toward one side and the guide on said side being movably mounted to permit the removal of said feed-roll.

4. In a machine of the class described, the combination of a supporting-frame, a horizontally-disposed rotary shaft journaled therein and having a free end projecting beyond its bearing, a removable feed-roll mounted on said free end, a second rotary shaft journaled above the other shaft in a vertically-movable bearing and having a free end projecting beyond its bearing, an impression-roll adapted to coast with said feed-roll and removably mounted upon the free end of said second shaft, a guide located on each side of said feed-roll at its upper part and both of said guides being in a vertical plane extending through and parallel with the axis of both of said shafts, a movable member secured to said frame and supporting the guide on the outside of said feed-roll in adjustable manner to permit the removal of the feed-roll toward the free end of its shaft.

5. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein upon a horizontally-disposed axis, an impression-roll disposed above said feed-roll and journaled in said frame in a vertically-movable bearing, a guide located upon each side of the feed-roll at its upper part and both of said guides being located in a vertical plane extending through and parallel with the axis of both of said rolls, and each being adjustable toward and from each other, said feed-roll being removable toward one side and the guide on said side being movably mounted to permit the removal of said feed-roll.

6. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein upon a horizontally-disposed axis, an impression-roll disposed above said feed-roll and journaled in said frame in a vertically-movable bearing, a guide located upon each side of the feed-roll at its upper part, and both of said guides being located in a vertical plane extending through and parallel with the axis of both of said rolls, a platform having a recess through which the upper face of said feed-roll projects, cross-pieces adjustably mounted upon opposite sides of said recess and each supporting one of said guides.

7. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein, an impression-roll journaled in said frame in movable bearings, said impression-roll having its free end opposed to and adapted to coast with the face of the feed-roll upon an interposed picture-frame, and a pair of guides mounted on said supporting-frame and adapted to have contact with opposite sides of said picture-frame at points located in a plane extending through and parallel with the axis of both of said rolls, one of said guides being adjustable in said plane toward and from the other guide.

8. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein, an impression-roll journaled in said frame in movable bearings, said impression-roll having its free end opposed to and adapted to coast with the face of the feed-roll upon an interposed picture-frame, and a pair of guides mounted on said supporting-frame and adapted to have contact with opposite sides of said picture-frame at points located in a plane extending through and parallel with the axis of both of said rolls, both of said guides being adjustable in said plane toward and from each other.

9. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein, an impression-roll journaled in said frame in movable bearings, said impression-roll having its free end opposed to and adapted to coast with the face of the feed-roll upon an interposed picture-frame, and a pair of guides mounted on said supporting-frame and adapted to have contact with opposite sides of said picture-frame at points located in a plane extending through and parallel with the axis of both of said rolls, both of said guides being adjustable in said plane toward and from each other.

10. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein, an impression-roll journaled in said frame in movable bearings, said impression-roll having its free end opposed to and adapted to coast with the face of the feed-roll upon an interposed picture-frame, and a pair of guides mounted on said supporting-frame and adapted to have contact with opposite sides of said picture-frame at points located in a plane extending through and parallel with the axis of both of said rolls, said rolls being removably mounted and one of said guides being movably mounted to permit the removal of said feed-roll in the direction of each guide.

11. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein upon a horizontally-disposed axis, an impression-roll disposed above said feed-roll and journaled in said frame in a vertically-movable bearing, a guide located upon one side of the feed-roll at its upper part and substantially in a vertical plane extending through and parallel with the axis of both of said rolls, said feed-roll being removable toward said guide, and said guide being movably mounted to permit the removal of said feed-roll.

12. In a machine of the class described, the combination of a supporting-frame, a horizontally-disposed rotary shaft journaled therein and having a free end projecting beyond its bearing, a removable feed-roll mounted on said free end, a second rotary shaft journaled above the other shaft in a vertically-movable bearing and having a free end projecting beyond its bearing, an impression-roll adapted to coast with said feed-roll and removably mounted upon the free end of said second shaft, a guide located at the upper part of said feed-roll at the side of same toward the free end of its shaft, said guide being movably mounted to permit the removal of said feed-roll toward the free end of its shaft.

13. In a machine of the class described, the combination of a supporting-frame, a horizontally-disposed rotary shaft journaled therein and having a free end projecting beyond its bearing, a removable feed-roll mounted on said free end, a second rotary shaft journaled above the other shaft in a vertically-movable bearing and having a free end projecting beyond its bearing, an impression-roll adapted to coast with said feed-roll and removably mounted upon the free end of said second shaft, a guide located at the upper part of said feed-roll at the side of same toward the free end of its shaft, said guide being located substantially in a vertical plane extending through and parallel with the axis of both of said rolls and being movably mounted to permit the removal of said feed-roll toward the free end of its shaft.

14. In a machine of the class described, the combination of a supporting-frame, a horizontally-disposed rotary shaft journaled therein and having a free end projecting beyond its bearing, a removable feed-roll mounted on said free end, a second rotary shaft journaled above the other shaft in a vertically-movable bearing and having a free end projecting beyond its bearing, an impression-roll adapted to coast with said feed-roll and removably mounted upon the free end of said second shaft, a guide located at the upper part of said feed-roll at the side of same toward the free end of its shaft, said guide being located substantially in a vertical plane extending through and parallel with the axis of both of said rolls and being adjustable toward and from said feed-roll.

15. In a machine of the class described, the combination of a supporting-frame, a rotary shaft journaled in said frame and having a free end projecting beyond its bearing, a removable feed-roll mounted on said free end, a second rotary shaft journaled in said frame in a movable bearing and having a free end projecting beyond its bearing, an impression-roll mounted on said free end and having its free end opposed to and adapted to coast with the face of the feed-roll upon an interposed picture-frame, a guide located upon one side of the feed-roll at the part of its periphery disposed toward said impression-roll, said guide being substantially in a plane extending through and parallel with the axis of both of said rolls, said feed-roll being removable toward said guide, and said guide being movably mounted to permit the removal of said feed-roll.

16. In a machine of the class described, the combination of a supporting-frame, a rotary shaft journaled in said frame and having a free end projecting beyond its bearing, a removable feed-roll mounted on said free end, a second rotary shaft journaled in said frame in a movable bearing and having a free end projecting beyond its bearing, an impression-roll mounted on said free end and having its free end opposed to and adapted to coast with the face of the feed-roll upon an interposed picture-frame, a guide located upon one side of the feed-roll at the part of its periphery disposed toward said impression-roll, said guide being substantially in a plane extending through and parallel with the axis of both of said rolls, said feed-roll being removable toward said guide, and said guide being movably mounted to permit the removal of said feed-roll, yielding means acting on the movable shaft and normally holding said impression-roll away from the feed-roll and picture-frame, and means for urging said impression-roll toward said feed-roll and upon said picture-frame.

17. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein upon a horizontally-disposed axis, a rotary shaft journaled in said frame above the axis of the feed-roll in a vertically-movable bearing and having a free end projecting beyond its bearing, an impression-roll adapted to coast with said feed-roll and removably mounted upon the free end of said rotary shaft, a guide located at the upper part of said feed-roll at one side of same and substantially in a vertical plane extending through and parallel with the axis of both of said rolls, yielding means acting on the movable shaft and normally holding said impression-roll away from the feed-roll and picture-frame, and means for urging said impression-roll toward said feed-roll and upon said picture-frame.

18. In a machine of the class described, the combination of a supporting-frame, a feed-roll journaled therein, a rotary shaft journaled in said frame in a movable bearing and having a free end projecting beyond its bearing, an impression-roll mounted on said free end and having its free end opposed to and adapted to coast with the face of the feed-roll upon an interposed picture-frame, a guide located upon one side of the feed-roll at the part of its periphery disposed toward said impression-roll, said guide being substantially in a plane extending through and parallel with

the axes of both of said rolls, yielding means acting on the movable shaft and normally holding said impression-roll away from the feed-roll and picture-frame, and means for urging said impression-roll toward said feed-roll and against said picture-frame.

DESIGNS.

85,850. HANDLES FOR SPOONS OR SIMILAR ARTICLES. HENRY H. BURDICK, SYRACUSE, N. Y. Filed Feb. 13, 1902. Serial No. 94,002. Term of patent 7 years.

Claim.—The design for a handle for spoons, or similar articles, as herein described and shown.

85,851. WATCHCASE. HENRI VICTOR DUCOUSSON, CHAM-DE-FONDS, SWITZERLAND. Filed Dec. 6, 1901. Serial No. 94,007. Term of patent 14 years.

Claim.—The design for a watchcase herein shown and described.

85,852. RING-TRAY. JAMES L. HENSON, NEW YORK, N. Y. Filed Mar. 11, 1902. Serial No. 97,794. Term of patent 34 years.

Claim.—The design for a ring-tray as herein shown and described.

85,853. MUG. FRANK A. WELLS, NEW YORK, N. Y. Filed Feb. 10, 1902. Serial No. 94,405. Term of patent 14 years.

85,858.

Claim.—The design for a mug, substantially as herein shown and described.

85,854. MUG. FRANK A. WELLS, NEW YORK, N. Y. Filed Feb. 10, 1902. Serial No. 94,406. Term of patent 14 years.

Claim.—The design for a mug, substantially as herein shown and described.

85,855. TRIMMING. JENNIFER WILLIAMS, NEW YORK, N. Y. Filed Mar. 12, 1902. Serial No. 94,408. Term of patent 34 years.

Claim.—The design for a trimming substantially as herein shown and described.

April 8, 1902.

U. S. PATENT OFFICE.

437

85,856. CUT-GLASS VESSEL. PAUL F. FARMER, Chicago, Ill.
Filed Mar. 11, 1902. Serial No. 98,116. Term of patent 7 years.

Claim.—The design for a cut-glass vessel substantially as herein shown and described.

85,857. LAMP. PAUL F. FARMER, Chicago, Ill. Filed Jan. 27, 1902.
Serial No. 98,372. Term of patent 7 years.

Claim.—The design for a lamp, substantially as herein shown and described.

TRADE-MARKS

REGISTERED APRIL 8, 1902.

88,050. PERIODICAL. W. E. GANNETT, Publisher, Augusta, Me. Filed Mar. 6, 1902.

COMFORT

Essential feature.—The word "COMFORT." Used since November 21, 1899.

88,051. CERTAIN NAMED PAPER. BLAKE, HOFFITT & TOWNE, San Francisco, Cal. Filed Jan. 14, 1902.

Essential feature.—The representation of a four-leafed clover. Used since February 29, 1897.

88,052. GAME. ARTHUR J. PATTERSON, Kalamazoo, Mich. Filed Mar. 10, 1902.

FLINCH.

Essential feature.—The word "FLINCH." Used since May, 1901.

88,053. WITHDRAWN.

88,054. COARSE UNBLEACHED COTTON. HINER HOFFER & Co., New York, N. Y. Filed Feb. 17, 1902.

Essential feature.—The representation of a monkey standing on its hind with its limbs extended. Used since February 14, 1902.

88,055. ORIENTAL. RICHARDSON, New York, N. Y. Filed Feb. 17, 1902.

Essential feature.—The representation of a scroll with a Chinese word thereon and two stags, one on each side of it, and a border. Used since October 1, 1901.

88,056. CLOTH, CORDING, AND LINO FABRIC. HARRY W. SMITH, North Crafton, Mass. Filed Mar. 21, 1901.

Essential feature.—The word "RUDDY." Used since December 19, 1900.

88,057. WOVEN SILK FABRIC. PRALANT SILK MILL, Jersey City, N. J. Filed Feb. 15, 1902.

FW

Essential feature.—The word "FORT." Used since October 15, 1894.

88,058. OVERALLS AND COATS. AMERICAN MANUFACTURING Co., Greensboro, N. C. Filed Feb. 21, 1902.

Essential feature.—The words "BATTLE-AXIS" and the representation of a battle-ax upon a disk. Used since January, 1902.

88,059. BOOTS AND SHOES. CRAWFORD SHOE MAKING, New York, N. Y. Filed Feb. 27, 1902.

88,059.

Essential feature.—The representation of a shield ornamented by a crown, a lion wearing a crown at each side of the shield, and a scroll beneath the shield and lion. Used since February 18, 1902.

88,060. **BOOTS AND SHOES.** G. H. WITT SHOE CO., Lynchburg, Va. Filed Mar. 12, 1902.

DIXIE

Essential feature.—The word "DIXIE." Used since March 4, 1902.

88,061. **BOOTS AND SHOES.** G. H. WITT SHOE CO., Lynchburg, Va. Filed Mar. 12, 1902.

DIXIE GIRL

Essential feature.—The words "DIXIE GIRL." Used since March 4, 1902.

88,062. **SHOES.** FORD & FRASER, Baltimore, Md. Filed Feb. 12, 1902.

Nacirema

Essential feature.—The word "NACIREMA." Used since December 5, 1901.

88,068. **PEANUTS.** ALFRED S. FORTY, Philadelphia, Pa. Filed Feb. 26, 1902.

HAVSUM.

Essential feature.—The word "HAVSUM." Used since December 15, 1901.

88,064. **WHEAT-FLOUR.** EDWARD WATSON MILL CO., Burlington, Kans. Filed Feb. 9, 1902.

Essential feature.—The representation in profile of a woman standing at one side of and pointing with extended arm to a map showing the Missouri, Kansas & Texas railway, together with the States and Territories through and adjacent to which said railway extends. Used since January 17, 1902.

88,065. **LARD COMPOUND.** THE SOUTHERN COTTON OIL CO., Jersey City, N. J.; Savannah, Ga., and Graton, La. Filed Feb. 21, 1902.

SNOWDRIFT

Essential feature.—The word "SNOWDRIFT." Used since November 17, 1902.

88,066. **LARD COMPOUND.** THE SOUTHERN COTTON OIL CO., Jersey City, N. J.; Savannah, Ga., and Graton, La. Filed Feb. 21, 1902.

SNOWDROP

Essential feature.—The word "SNOWDROP." Used since January 26, 1902.

88,067. **CURTAIN HANGING CROCHING.** J. B. BROWN, GROCERY Co., Wheeling, W. Va. Filed Jan. 9, 1902.

Essential feature.—The words "CLUB HOUSE" and the pictorial representation of a conventional club-house located in the midst of hilly scenery. Used since March 20, 1902.

88,068. CERTAIN NAMED GROCERIES. MARSHALL SMITH, Toledo, Ohio. Filed Feb. 17, 1902.

ARNA

Essential feature.—The word "ARNA." Used since June 1, 1901.

88,069. CERTAIN NAMED GROCERIES. SPRAGUE, WARNER & COMPANY, Chicago, Ill. Filed Mar. 10, 1902.

MONSOON

Essential feature.—The word "MONSOON." Used since February 19, 1902.

88,070. CERTAIN NAMED GROCERIES. SPRAGUE, WARNER & COMPANY, Chicago, Ill. Filed Mar. 10, 1902.

TABLE D'HOTE

Essential feature.—The words "TABLE D'HOTE." Used since February 19, 1902.

88,071. CERTAIN NAMED GROCERIES. SPRAGUE, WARNER & COMPANY, Chicago, Ill. Filed Mar. 10, 1902.

MASTIFF

Essential feature.—The word "MASTIFF." Used since February 19, 1902.

88,072. NON-INTOXICATING BEVERAGES. PHILIP SCHALLER and BEVINS COMPANY, Birmingham, Ala. Filed Mar. 8, 1902.

HOP-JACK

Essential feature.—The word "HOP-JACK." Used since March 20, 1902.

88,073. VINEGAR. JAMES BROS. & CO., Louisville, Ky. Filed Mar. 4, 1902.

BLUE GRASS BELLE

Essential feature.—The words "BLUE GRASS BELLE." Used since April 1, 1901.

88,074. CERTAIN NAMED FOODS AND DELICIES. ADAM & BARNETT and THE WESTERN SWEETEN ORANGE CO., Ltd., Yeovil, England. Filed Mar. 8, 1902.

SILVEL

Essential feature.—The words "ST. IVEL." Used since April, 1901.

88,075. BREAD-POWDER FOR CAKES AND CONFECTIONERY. HENRY H. OTTER, Philadelphia, Pa. Filed Jan. 10, 1902.

Quaker

Essential feature.—The word "QUAKER" and the representation of a Quaker apparently in the act of mixing being in a receptacle before him. Used since October 27, 1901.

88,076. BREADS, CAKES, AND CONFECTIONERY. FRANKLIN I. DUNNETT, New York, N. Y. Filed Dec. 11, 1901.

Essential feature.—The representation of a shield and three hills, from the central one of which a grape-vine extends, on the upper portion of the shield being a star and supported on the shield the representation of a helmet, together with scrolls and branches extending from opposite sides of the helmet and downward at the sides of the shield. Used since November 14, 1901.

88,077. CERTAIN NAMED FRUIT AND MEDICINAL AND FOOD PRODUCTS OF SUCH FRUIT. FRANKLIN A. BARNES, Hamilton, Bermuda. Filed Jan. 15, 1902.

Essential feature.—A pyramidal arrangement of fruit, the letters "V C," and a monogram comprising the letters "F A R." Used since March 4, 1901.

88,078. COUGH-SYRUPS AND REMEDIES FOR CERTAIN NAMED DISEASES. CURE G. B. GLEN, New York, N. Y. Filed Feb. 24, 1902.

Cheer Bee Gee

Essential feature.—The grouped syllables "O CHEER BEE GEE." Used since February 4, 1902.

88,079. MEDICINAL COMPOUND IN POWDER FORM PUT UP IN GELATINOUS CAPSULES. JAMES R. HENDERSON COMPANY, Philadelphia, Pa. Filed Dec. 8, 1904.

Essential feature.—The representation of a life-cover or coat-guard and a life-preserver, within which is limited the representation of a heart. Used since September, 1904.

88,080. MEDICAL COMPOUND FOR CERTAIN NAMED DISEASES. GEORGE A. KNOX, Rochester, N. Y. Filed Feb. 7, 1902.

ROX

Essential feature.—The word "ROX." Used since March 1, 1906.

88,081. CERTAIN NAMED MEDICINAL REMEDY. KRAM & OWEN COMPANY, New York, N. Y. Filed Dec. 25, 1902.

GLYCO-THYMOLINE

Essential feature.—The word "GLYCO-THYMOLINE." Used since June, 1906.

88,082. MEDICINAL OIL. MAX R. RABEN, Stettin, W. Pr. Filed Jan. 27, 1903.

ZMO

Essential feature.—The letters "Z M O." Used since October 27, 1907.

88,083. CERTAIN NAMED OIL. ROBERT SCHULMANN'S OILWORKS, SCHULMANN & SONS, BREITENBURGER HAUPTSTADT, Hamburg, Germany. Filed Feb. 7, 1902.

Essential feature.—A swastika enclosed in a circle. Used since January 1, 1905.

88,084. SOAP. MAPLE CITY SOAP WORKS, Monmouth, Ill. Filed Nov. 12, 1901.

MAPLE CITY

Essential feature.—The words "MAPLE CITY." Used since October 12, 1904.

88,085. STICKY FLY-PAPER. THOMAS D. BOSTRAN, Chicago, Ill. Filed Feb. 6, 1902.

NICKEL PLATE

Essential feature.—The words "NICKEL PLATE." Used since November 1, 1901.

88,086. WALL-PLASTER. GRANITE WALL-PLASTER CO., Lebanon, Pa. Filed Mar. 4, 1902.

GRANITINE

Essential feature.—The word "GRANITINE." Used since October 22, 1905.

88,087. POCKET-KNIVES, RAZORS, AND SCISSORS. HERMANN RICH & CO., Solingen, Germany. Filed Mar. 4, 1902.

TREE

Essential feature.—The word "TREE." Used for the last thirty years.

88,088. INCANDESCENT BAYONET. WALTER H. TAYLOR, Toronto, Canada. Filed Mar. 10, 1902.

IRONSIDES

Essential feature.—The word "IRONSIDES." Used since March 4, 1901.

88,089. TALKING-MACHINES. UNIVERSAL TALKING MACHINE CO., New York, N. Y. Filed Feb. 25, 1902.

ЗОНОФОНЪ

Essential feature.—The word "ЗОНОФОНЪ" in Russian characters. Used since November 1, 1901.

88,090. BOTTLES. WILLIAM ALLEN CHAPMAN, New York, N. Y. Filed Mar. 1, 1902.

RHODIA

Essential feature.—The word "RHODIA." Used since August 12, 1901.

88,091. WATER-FILTERS. SMITH & BOWEN, Windsor, Canada, and Chicago, Ill. Filed Feb. 25, 1902.

ROTA

Essential feature.—The word "ROTA." Used since January 27, 1906.

88,092. PRINTING AND ENROBING PRESS AND APPL-
ICATIONS THEREFOR. JAMES THOMAS PRESS CO., NEW
YORK, N. Y. Filed July 17, 1901.

Essential feature.—The representation of an internal gear with the
representation of a colt within the gear. Used since March, 1901.

88,098. VENTILATING DEVICES. THE BUREAU VENTILATING
CO., INC., DETROIT, MICH. Filed Feb. 25, 1902.

PURITUS

Essential feature.—The word "PURITUS." Used since October
24, 1901.

88,094. CERTAIN BAKED FLOURING COOKIES. BECK'S BAKING
POWDER CO., NEW YORK, N. Y. Filed Feb. 6, 1902.

CELLUVARNO

Essential feature.—The word "CELLUVARNO." Used since Jan-
uary 1, 1900.

LABELS

REGISTERED APRIL 8, 1902.

9,064.—Title: "A. MFG. CO." (For Overalls.) AMERICAN MFG.
CO., GREENSBORO, N. C. Filed March 10, 1902.

9,065.—Title: "NONE SUCH." (For Brooms.) THE NEW
BROOMS CO., NEW BRUNSWICK, OHIO. Filed March 17, 1902.

ers.) AMERICAN LITHOGRAPHIC COMPANY, BUFFALO, N. Y.
Filed March 15, 1902.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

SILVERMAN v. HENDRICKSON.

Decided May 4, 1897.

1. INTERFERENCE—PRIORITY—STIPULATION.

A stipulation that S. completed the invention in June and July does not prove that he completed it before June 9, when H. filed his application.

2. SAME—REDUCTION TO PRACTICE—EXPERIMENTAL PRODUCTION OF COMPOSITION.

Where the issue is for defiberized cornstalk-pith saturated with oil and it appears that S. produced the pith and in experimenting with it saturated small quantities with oil, but made no practical use of it to determine its properties and value, *Held* not a reduction to practice.

3. SAME—SAME—MUST BE PRACTICAL USE OF COMPOSITION.

It is not necessary to a reduction to practice that S. should have thought of all uses to which the composition could be applied and have actually employed it practically for those uses, but merely that he should have tested it to determine its qualities, so as to demonstrate its practical utility for some purposes.

4. SAME—FAILURE OF INVENTOR TO TESTIFY.

The failure of an inventor to appear and testify in his own behalf is capable of an unfavorable inference; but where he has assigned his invention and is not friendly with the assignee it is not entitled to much weight.

5. SAME—SUPPLEMENTAL OATH—EX PARTE MATTER.

The question whether or not a party should be called upon for a supplemental oath is an *ex parte* matter not open to argument in an interference proceeding.

APPEAL from Examiners-in-Chief.

DOCKET-PATENT.

Application of Lazarus Silverman filed December 4, 1897, No. 660,782. Application of Joseph C. Hendrickson filed August 20, 1897, No. 648,871.

Messrs. Church & Church for Silverman.

Mr. A. B. Stoughton and Messrs. Foster & Freeman for Hendrickson.

ALLEN, Commissioner:

This is an appeal by Silverman from the decision of the Examiners-in-Chief awarding priority of invention to Hendrickson upon the following issue:

A composition consisting of the light cellular substance separated out from the fibers in cornstalk-pith, the same being charged with oil, substantially as described.

There is some contention as to what fibers are referred to in this issue; but it is clear from a consideration of the entire case that they are those embedded in and extending lengthwise of the pith contained within the outer shell of the cornstalk.

The decision of the Examiner of Interferences was in favor of Silverman.

In his preliminary statement Silverman claims

9006-2-11

to have conceived the invention and disclosed it to others "during the early part of 1897" and to have made samples embodying it "during the summer of 1897." In his testimony he alleges conception and disclosure in February, 1897.

It has been stipulated—

* * * that as early as June and July of 1897, the said Silverman, at Indianola and elsewhere, made various tests with the said defiberized corn-pith, by using said defiberized corn-pith as an absorbent for oil, and demonstrating the value of said mixture as a lubricant by its application to shafting or journals.

This stipulation clearly covers a reduction to practice of the invention and establishes about as early a date therefor as Silverman could be permitted to prove under the allegation in his statement.

Hendrickson in his statement alleges conception and disclosure in January, 1897, and does not specifically allege a reduction to practice. He filed an application for a patent, however, on June 9, 1897, which was subsequently abandoned in favor of his present application, and therefore he is entitled to June 9, 1897, as the date of constructive reduction to practice of the invention.

The Examiner of Interferences held that Silverman was the first to conceive and also the first to reduce to practice, whereas the Examiners-in-Chief came to the opposite conclusion on both questions, and I fail to find any contention in the brief on behalf of Silverman that he was the first to reduce to practice. On the contrary, it is practically admitted that he was not the first, since it is contended that the decision should be in his favor on the ground that Silverman is shown—

to have been the first to have conceived the invention and to have thereafter with reasonable diligence reduced the invention to practice.

The stipulation clearly does not show Silverman to have been the first to reduce to practice, since the statement that he did so in June or July does not prove that it occurred prior to June 9, when Hendrickson's application was filed. Silverman cannot be permitted to show by testimony a reduction to practice earlier than the summer of 1897, (*Cross v. Phillips*, 87 O. G., 1896,) and therefore he can prove no date earlier than June 1. The testimony on his behalf shows that in February, 1897, he made experiments with cornstalk-pith, his principal object being to remove the fiber and produce a substance "superior to that which the Marsden people made."

He used the substance in an experimental way to absorb different liquids, including some forms

of oil, and therefore there seems to be no doubt that he actually produced in small quantities the composition of the issue. If the mere production of this composition in the manner indicated in the testimony could be considered a reduction to practice in any event, it could not, as above stated, avail Silverman for any date prior to June 1. It does not, however, in my opinion, amount to a reduction to practice. Silverman does not seem to have appreciated the practical utility of the composition, and its production seems to have been a mere incident of his tests to determine the qualities of the pith which he had produced. He knew, as others skilled in the art knew, that cornstalk-pith was a good absorbent, and therefore he naturally in testing the pith which he had produced tried it as an absorbent. The production of the composition in this manner does not seem to have demonstrated to him or to his witnesses the practical utility of it, since they made no practical use of it to determine its properties and value.

It appears that during experiments at a carpenter's shop the carpenter used a stick of pith "soaked in oil in place of a rag" to lubricate his saw. (Berry, Q. 222.) It cannot be held upon the testimony presented that this use amounted to a reduction to practice of the invention in issue.

If nothing more had been done after these experiments by Silverman, the public would have been in no better position than it was before and would not have derived the benefits from the present invention. It was not necessary to a reduction to practice that Silverman should have thought of all the uses to which the composition could be put and have actually employed it practically for those uses, but merely that he should have tested it to determine its qualities, so as to demonstrate its practical utility for some purposes. Silverman himself did not regard what he did as a reduction to practice, for he continually refers to it as an experiment, and in his preliminary statement does not allege it as a reduction to practice.

It is held that Silverman did not reduce the invention to practice before June 2, 1897, and that therefore Hendrickson was the first to reduce to practice.

I am not prepared to accept the view of the Examiners-in-Chief that what Silverman did in February, 1897, does not show a conception of the invention, although his actions indicate that he did not appreciate the practical utility of it. In any event the evidence satisfies me that Hendrickson had a conception of the invention prior to that time.

Gibbs testifies positively that Hendrickson disclosed the invention to him in January, 1897, and his statement is supported to a certain extent by a letter written by him to one Marden on March 27, 1897. In that letter he ordered some—

cellulose to be used for the purpose of packing journal-boxes of cars—

and it was said that—

Mr. Hendrickson . . . is under the impression that a coarse grade as free from fiber as possible would be the best.

That letter was written after the date of Silver-

man's experiments, but it must be borne in mind that Silverman does not claim to have disclosed his invention to Gibbs or Hendrickson, and since there was no contest at that time between these parties as to the invention the letter must be taken as showing that as early as its date Hendrickson had an independent conception of the invention. It adds plausibility to Gibbs's statements that prior thereto and in January Hendrickson disclosed the invention to him.

Hendrickson failed to appear and testify in his own behalf; but this is explained by the statement that he has assigned his entire right, title, and interest to the Marden Company and is not now friendly to that company. His failure to testify is undoubtedly capable of an unfavorable inference; but under the circumstances it should not be given so much weight as has been accorded it by Silverman and by the Examiners of Interferences.

Much of the argument on behalf of Silverman has been directed to the question whether or not Hendrickson's application as filed disclosed the present invention and whether or not he has made oath that he is the inventor of it. Hendrickson says in his specification filed June 2, 1897, (p. 2, l. 1):

Corn-pith in its natural state is not suited to the purpose described. Corn-pith is usually associated with fibers and with woody material. The fibers and woody materials may be removed, but, if present, do not necessarily destroy the feeding properties of the pith. The corn-pith is a feeder and conveys the lubricant to the journal.

Hence it appears that the inventor suggested the removal of the fibers in his original application, furnishing proper foundation for the insertion of the later claim, (the fourth,) now in interference. This is a clear description of the composition of the issue and carries back Hendrickson's constructive reduction to practice to June 2, 1897.

The question whether or not Hendrickson should be called upon for a supplemental oath is an *ex parte* matter not open to argument in an interference proceeding. (*Reinyson v. Merritt*, 58 O. G., 1415.) It may be noted, however, that Hendrickson has in his preliminary statement at least made oath that he is the inventor of the matter in issue.

It is held that Hendrickson was the first to conceive and the first to reduce to practice and that therefore he is entitled to an award of priority.

The decision of the Examiners-in-Chief is affirmed.

PETER C. DE SCHWEINITZ.

Decided July 1, 1901.

1 INTERFERENCE—TESTIMONY OF INVENTOR INCOMPETENT—CORROBORATION.

Considering the natural bias of a party and the incentive to color the testimony in his own interest, the rule that his testimony upon a point will not be accepted as sufficient is so universally accepted that it may be said that his testimony is incompetent until corroborated.

2 SAME—EVIDENCE—REDUCTION TO PRACTICE—CONCEPTION.

Where P. alleged that he successfully performed the process of the issue at a certain time and witnesses state that he then told them that he had performed the process, but they did not see it performed, Held not a corroboration as to reduction to practice, but merely as to conception.

[Vol. 99. No. 2.]

3 SAME—LACK OF DILIGENCE—POVERTY.

Where poverty cannot excuse an absence of all effort in regard to an invention for a period of six years.

4 SAME—SAME—FAILURE TO PRACTICALLY USE INVENTION.

Where a party claims to have had a complete knowledge of a process involving the use of bacterial food and had one form of such food, Held that his failure to practically use the process for several years is not to be excused upon the allegation that he was trying to find a food which could be obtained at all seasons.

APPEAL FROM EXAMINERS-IN-CHIEF.

TREATING TOBACCO.

Application of James P. Petrie filed August 10, 1899, No. 726,881. Application of Emil A. de Schweinitz filed February 4, 1897, No. 692,084.

Mr. C. W. Rice, Mr. Clarence K. Chamberlain, and Mr. Hervey S. Knight for Petrie.

Messrs. Pennie & Goldsborough for De Schweinitz.

ALLEN, Commissioner:

This is an appeal by Petrie from the decision of the Examiners-in-Chief awarding priority of invention to De Schweinitz upon the following issue:

1. The process of treatment of tobacco of inferior quality, consisting, first, in sterilizing the same, under such conditions and sufficiently long-continued as to destroy the original bacteria and spores existing therein, then adding to the sterilized tobacco bacteria or cultures thereof to produce a new and characteristic flavor, and then subjecting the tobacco to fermentation, substantially as and for the purpose described.

2. The process of changing the flavor of tobacco, which consists in first freezing the tobacco of the species of bacteria originally existing thereon, and then adding in place thereof bacteria or cultures thereof, to produce a new and characteristic flavor, and also a material suitable for bacterial food, substantially as described.

De Schweinitz has taken no testimony and relies upon his filing date, February 4, 1897, for proof of priority.

Petrie alleges conception in the spring of 1896, disclosure to others in 1898, and a reduction to practice in the spring of 1899, not later than June 15. His application was not filed until August 10, 1899.

The substance of Petrie's own testimony is as follows: In 1896 he first began making investigations in regard to the bacteria of tobacco and at that time—

• • • procured specimens of tobacco, of native tobacco, and after sterilizing the same, by the use of steam, I would prepare a bacterial food which was composed of the juice of green vegetation and sprinkle upon this native tobacco, Havana tobacco, and put it away for fermentation.

This was intended to first destroy the bacteria existing upon the native tobacco and then cultivate thereon the bacteria of the higher-grade tobacco, so as to improve the flavor. He used several kinds of "green vegetation," among which was blue grass, and by its use—

the aroma of the tobacco was improved, but the tobacco had a woody taste that was objectionable.

Hardly a day passed between that time and 1898, when he moved to Burlington, Iowa, to engage in the crockery business, that he was not at work on his invention. At Burlington he explained to Doctor Cochran—

a good deal of the process of this changing of native tobacco—

and—

told him that the process was complete as far as I could complete it, but there was one thing that bothered me and that was to obtain this bacterial food at all times.

He continued in business in Burlington until the latter part of 1899, when he failed, losing everything. During that time he worked on the inven-

[Vol. 99.

tion in the evenings and told Doctors Jones, Wilson, and Holiday of it, "but only in a general way." (Q. 67.) In 1898 he hit upon the idea of using sprouted barley to obtain his "bacterial food" and found this to be satisfactory in every respect. He says:

The process was perfect in 1898. There was one link that I did not get until the spring of 1899. I was looking continually for a bacterial food that could be gotten at all times, and I did not get that until 1899.

From 1898 to 1899 he was very poor, but continued to experiment with his process of treating tobacco and upon coming into possession of some money, in 1899, filed his application. He did not file his application earlier because he did not have the money to pay the expenses. (Q. 159.)

No witnesses called to corroborate Petrie as to the statements made by him testify to a personal knowledge of the work which he did. Most of them say merely that Petrie told them that he had made some invention relating to tobacco; but they did not understand what the invention was. Petrie himself says:

I concluded very early in my investigations that the best thing I could do was to keep everything I was doing strictly to myself—

and the testimony of the witnesses indicates that he succeeded in doing so. The witnesses Brady and Cochran, however, do state that Petrie described to them the process used by him. Brady says:

• • • He said that his process consisted of taking our native tobacco, sterilizing it, placing the better grades of tobacco with its bacteria upon the native tobacco, after first having treated the native tobacco with bacterial food, and after fermentation the tobacco was so changed (the native tobacco was so changed) as to make a decided improvement.

The testimony of Cochran is to the same effect, although he admits that he was not interested in the subject and paid very little attention to Petrie's disclosures.

The testimony of the witnesses as to what Petrie told them he was doing or intended to do may be taken as showing that he had a conception of the invention at that time; but it cannot be accepted as showing a reduction to practice. Petrie himself is the only one who testifies to an actual performance of the process of the issue. None of the others saw it, and all that they know of it was derived from Petrie's statements. The testimony of these witnesses does not corroborate Petrie's present statement that he successfully performed the process, and his unsupported statement to that effect is insufficient to establish the fact. From the nature of the invention the result of his experiments performed in secret could not be preserved to show what was done and whether or not it amounted to a reduction to practice of the invention, and his present statement of his conclusion that his experiments were successful and constituted a reduction to practice of the invention is not capable of being rebutted any more than would be the statement of an inventor as to his conception. Considering the natural bias of a party and the incentive to color the testimony in his own interest, it has been repeatedly held that the unsupported testimony of the inventor is insufficient to establish facts of this kind. (*Mergenthaler v.*

No. 2.]

Scudder, 81 O. G., 1417; *Winslow v. Austin*, 86 O. G., 2171.) This rule is so universally accepted that it may be said that the testimony of the inventor on questions of this kind is incompetent until corroborated.

Considering Petrie as the first to conceive but the last to reduce to practice, the question arises whether he was exercising diligence when De Schweinitz filed his application. There is a delay of thirteen years after his alleged conception to be explained. He alleges that for the first seven years, or until 1888, he was searching for the proper "bacterial food," and after that date he was financially unable to apply for a patent. Considering all of the circumstances, these excuses are clearly insufficient. The first rests upon his own statement, and that statement is not consistent with other testimony given by him or with his conduct. He says himself that his invention was complete in 1888 and that the only difficulty was that he was not able to obtain the bacterial food at all times, thus indicating that the trouble, if any, was in his ability to obtain the food easily and not in its character. This view is strengthened by an inspection of the issue and the other claims of Petrie's application, none of which are limited to the particular "bacterial food" obtained from sprouted barley which is now claimed to be so important. They are broad and apply to what Petrie claims to have had in 1888. Petrie's own testimony shows that he had ample means to make practical use of the invention or file an application at any time up to 1898.

Even if the time after his discovery of sprouted barley in 1898 is alone considered, Petrie did not exercise reasonable diligence. It is true that he seems to have been poor; but there is no showing whatever that he tried to interest others in the invention to assist him in securing a patent or in making practical use of the invention; but, on the contrary, he seems to have intentionally kept it from the public. Mere poverty cannot excuse an absence of all effort for such a length of time. According to his own showing all that Petrie did between 1898 and 1899 was to make a few experiments in private upon the same lines as his previous experiments without accomplishing or expecting to accomplish anything further than he had previously accomplished.

If it is conceded that Petrie was the first to conceive, he was the last to reduce to practice and was lacking in diligence when De Schweinitz entered the field. De Schweinitz must therefore be considered the first inventor.

The decision of the Examiners-in-Chief is affirmed.

EX PARTE BAUERCAMPER.

Decided March 22, 1902.

EXTENSION OF TIME FOR FILING AMENDMENT—SECTION 4894 OF THE REVISED STATUTES.

A request for an extension of time for filing an amendment cannot be granted when the period extends over the statutory limit within which the application must be prosecuted under the provisions of section 4894 of the Revised Statutes in order to save it from abandonment.

ON petition.

CARTILIDGE-CHIEFTON MACHINES.

Application of Charles C. A. Bauercamper filed March 1, 1901, No. 49,482.

Mr. George W. Sues for the applicant.

ALLEN, Commissioner:

This is a petition that "the time for the filing of the amendment be extended ninety days."

This request is somewhat indefinite, as the date from which the ninety days is desired to run is not stated.

The records show that the application received a full and complete action on April 2, 1901. Under the provisions of section 4894 of the Revised Statutes the petitioner has until April 2, 1902, in which to prosecute this application. On the failure to prosecute within that time as the condition of the case may require the application—

shall be regarded as abandoned . . . unless it be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable. (Section 4894, Revised Statutes.)

Inasmuch as the petitioner has, under the provisions of the statute, until April 2, 1902, in which to prosecute this application, it is presumed that the petitioner desires the ninety days to run from April 2, 1902. However, whether the date from which the extension is desired to run is April 2, 1902, or March 14, 1902, the date of this petition, the period of ninety days extends over the statutory limit within which the application must be prosecuted in order to save it from abandonment.

It is therefore seen that the request for this extension amounts to a request for the Commissioner to set aside the plain provision of a statute. This he has no authority to do.

The petition is denied.

LOOMIS v. HAUSER.

Decided October 4, 1901.

1. INTERFERENCE—REDUCTION TO PRACTICE—COMPLETE DEVICE. Some inventions are so simple that no actual test is required when the device is a complete construction of full size and form. (Citing *Mason v. Hepburn*, 94 O. G., 147.)

2. SAME—SAME—HAND-MADE ENVELOPE.

An envelop constructed by hand made from a sheet of light brown paper, which on inspection is clearly seen to be capable of securely holding tickets, for which use the invention is intended, though never put into commercial use. Held to constitute a full and complete reduction to practice.

3. SAME—SAME—ABSENCE OF PRINTED MATTER.

A theater-ticket holder made from a sheet of ordinary paper and constructed as stated in the issue Held a reduction to practice, although the advertisements, program, time-table, and diagram of seats usually found on such holders were not printed thereon.

APPEAL from Examiners-in-Chief.

HOLDERS FOR THEATER AND TRANSPORTATION TICKETS.

Application of Eugene O. Loomis filed July 6, 1900, No. 22,681. Patent granted George Hauser June 19, 1900, No. 652,107.

Mr. R. W. Bishop for Loomis.

Mr. W. A. Redmond for Hauser.

MOORE, Assistant Commissioner:

This is an appeal by Hauser from the decision of the Examiners-in-Chief awarding priority of in-

vention to Loomis, which decision reversed the decision of the Examiner of Interferences awarding priority of invention to Hauser.

This interference is declared between the patent to Hauser, No. 652,107, granted June 19, 1900, on an application filed April 23, 1900, and the application of Loomis, filed July 6, 1900.

[The issue is in two counts, as follows:

1. A ticket-holder consisting of a blank having a flap at one corner thereof adapted to be folded but once over onto and pasted along merely two of its edges to said blank to form an open-ended pocket and said blank being folded on itself, so as to leave the pocket-opening uncovered, to a rectangular shape corresponding to the pocket.
2. A ticket-holder consisting of a blank having a flap at one corner thereof adapted to be folded but once over onto said blank and pasted thereto along merely two of its marginal edges to form an open-ended pocket, and said blank containing spaces for theater diagrams, programs, and advertising matter, and suitable to a rectangular shape corresponding to the pocket.]

Hauser having had a patent granted to him before Loomis filed his application, it is incumbent upon Loomis to prove his case beyond a reasonable doubt. In other words, any doubts that may exist should be resolved in favor of Hauser.

The patentee, Hauser, alleges conception of the invention in issue in May, 1897, and reduction to practice in September, 1897.

Loomis alleges conception in July, 1898, (not 1897, as stated by the Examiners-in-Chief,) and reduction to practice in November, 1898.

An exhibit filed by Hauser is in evidence, and it is clearly proven that this exhibit was constructed under the direction of Hauser in September, 1897. (Hauser Exhibit No. 1.)

Both of the lower tribunals agree as to this fact, and it is unnecessary now to analyze this part of the evidence.

This exhibit fully embodies the invention defined in the issue. It does not differ from the disclosure of the Hauser patent. The evidence shows that two of the three edges of the flap were originally secured to the sheet by some adhesive substance to form the envelop or pocket.

The Examiners-in-Chief state with respect thereto that—

these edges have since become detached. When we first examined the exhibit, the flap was still secured at the corner which, when the flap is folded upon the sheet, defines the intersection of the corners.

The flap is now completely detached. The adhesive substance is, however, clearly visible thereon. In view of the fact that the exhibit has been subjected to more or less handling and usage during a period of four years before and after it was filed in this Office, it is not surprising that the flap should have become detached. From a careful consideration of the law and the facts in this case it seems clear that this exhibit constitutes a full and complete reduction to practice.

The invention is a simple one and comes under the class of inventions considered by the court of appeals in *Mason v. Hepburn*, (94 O. G., 147.)

The device shown in Exhibit No. 1 is a complete construction of full size and form. It demonstrates the fact that it is capable of practical use. It is a complete envelop and is capable of securely holding the tickets. In order to constitute a reduction to practice, it is necessary that the device should be capable of performing the function or capable

of being put to the use for which it was intended. These envelopes are only intended to be put in use once. They are then destroyed or thrown away. It is not necessary that the device as constructed should be intended for commercial use.

The Examiners-in-Chief state that the device as shown in the Exhibit No. 1 is not, in their opinion, a complete device, for the reason that the various advertisements, the program, the time-table, and the diagram of seats are not clearly printed thereon.

This printed matter is merely an incident of the device. The device is complete in its construction without this printed matter. The printing does not affect the issue of the invention. It does not in any way affect the patentability of the device. The Examiners-in-Chief clearly err in holding that the Exhibit No. 1 is not the perfected thing because the various printed matter is not displayed thereon.

The description quoted by the Examiners-in-Chief from the specification can, however, be clearly read on the exhibit device. Another fault found by the Examiners-in-Chief with the Exhibit No. 1 is that it is made from "an unprinted sheet of light brown paper." The quality of the paper does not affect the issue of the invention. It is only necessary that the paper should be of such quality as to clearly and effectually prove the capability of the device for the use to which it is intended.

In fact, Mr. E. T. Mayer, who was associated with Mr. Max Meyer in canvassing for the envelopes among the various theater-managers, made the following suggestion, referring to the Loomis envelop in his letter to Mr. Meyer dated November 12, 1898, Loomis's Exhibit Y², (Loomis's record, pp. 46 and 47:)

Those gentlemen who are not under contract already, all advance the objection that the envelop is too heavy and large for a lady's pocket-book and as there is no occasion for them to be particularly lasting or tough, that is why I suggest a very thin, white paper, which would also reduce cost.

In the same letter Mr. Mayer also finds fault with the diagram as printed, saying that it is impossible to distinguish the numbers, and is therefore of no use. This goes to show that the diagram was equally indistinct on both envelopes as then constructed.

The decision by the court of appeals in *Lindemeyer v. Hoffman et al.* (95 O. G., 885) is cited by the Examiners-in-Chief as controlling in this case.

The facts are not the same in the case now under consideration as were present in the decision above cited. There the court laid great stress on the testimony of Hoffman himself—

who, in cross-examination, in answer to a question whether he regarded this particular cap as fit for practical use on a bottle, said:

"The design of it I do, but not the cap itself, as it is made in a very crude manner."

The facts were shown to be such that the cap submitted in evidence had to be changed and perfected in detail so as to be complete and capable of performing its function when put to the use for which it was intended.

Here in this case nothing has to be added to the envelop or taken from it. The envelop submitted is complete in itself, wholly capable of performing

the function for which it was intended—namely, that of securely holding and carrying the tickets inserted therein. To hold that the device shown in Hauser Exhibit No. 1 is not a complete reduction to practice of the invention would, in my opinion, be the equivalent of holding that a device in order to constitute a reduction to practice under the law must be machine-made and ready for immediate commercial use.

The machine-made device and the home-made device are equally capable of performing the function for which they are intended. Each is equally capable of securely holding tickets placed therein. In my opinion a device so simple in construction as the envelop in question in order that its practical use may be demonstrated can just as well be constructed at home with a sheet of paper, a pair of scissors, and a pot of glue as when made in a manufacturing establishment by means of a perfected envelop-machine.

Hauser being the first to conceive and the first to construct a device capable of practical use and having been granted a patent before Loomis filed his application is entitled to an award of priority over Loomis, who did not construct a device capable of practical use until a period of one year and four months had elapsed after the date on which Hauser made a complete device, unless it is proven beyond a reasonable doubt that Hauser during the interval of two years and seven months between the date of his construction of the device and the date of his application for a patent so abandoned any rights that he may have had, as was the case in *Mason v. Hepburn*, *supra*, that Loomis succeeded to them, Loomis having innocently entered the field during that interval.

There is no evidence in this case which goes to show that Hauser after constructing the envelop in September, 1897, laid the invention aside and forgot all about it, or, as stated in *Kendall v. Winsor*, (21 How., 322,) quoted in *Mason v. Hepburn*, *supra*, that he "designedly, and with the view of applying it indefinitely and exclusively for his own profit," withheld his invention from the public. On the other hand, he showed the invention to various parties—Mr. Bradley, Mr. Gorman—and asked their advice as to its commercial value and as to its patentability. He was not a man of means. On the contrary, he was compelled to borrow money in order to apply for his patent.

It is true that in comparison with Loomis he did not show the same business and commercial activity as Loomis. Diligence as between two parties is, however, in law not a matter of comparison; but the question to be determined is, in the one sufficiently diligent or active to show that he did not abandon his rights to the other party?

Hauser did not destroy the device constructed in September, 1897. He destroyed several of them, but kept the one useful. The device, Exhibit No. 1, was shown to witnesses Bradley and Holahan. The device was placed in Mr. Bradley's hands, who turned it over to Mr. Gorman to submit to a patent attorney in Washington. The ap-

plication was prepared from the Exhibit No. 1, and the patent corresponds in all respects to it. These facts are clearly proven and negative the contention that Hauser had destroyed the device constructed by him. On the other hand, it is clearly shown by the evidence that Hauser turned the actual device, Exhibit No. 1, over to parties in whom he had confidence for the very purpose of having a search made in the records of the Patent Office as to its novelty. He was sufficiently diligent to retain his rights. At all events it has not been proven beyond a reasonable doubt that he was not.

With respect to the application filed by Loomis, No. 897,076, filed November 31, 1898, which has been introduced in evidence, I agree with the Examiners-in-Chief in their opinion that—

the aforesaid application of Loomis does not, in our opinion, disclose the invention of the issue. The original drawing shows a pocket one wall of which is formed by a separate piece of paper, and the amended drawing, while it discloses the flap of the issue, shows that said flap is provided with adhesive material along three instead of two of its sides.

Loomis in his testimony states that this construction was not satisfactory for several reasons, and he improved the same when he invented the device defined in the issue of this interference. His statement as to the defects of his old device and the reasons for the invention of the new device defined in the present issue are clearly set forth in his answer to question 8, page 7, Loomis's record. This answer is as follows:

Answer. Shortly after I had received from the Rees Printing Company the ten thousand folders like Exhibit B, and while using them in the theater and elsewhere, I observed that the slot-opening would not always be sufficiently wide to accommodate or admit the insertion of transportation tickets; for, while short transportation trip-tickets could be readily inserted in the slot-opening, tickets for longer distances and requiring folding could not readily be adjusted to the slot-opening. It was therefore my desire to remedy this defect. Another thing I observed was that at times in inserting theater-tickets in the pocket, the end of the ticket would cut through the tissue-paper, thus rendering the pocket inconvenient and sometimes useless; and I also began to figure upon a ticket-holder which would be less expensive to manufacture than the one constructed like Exhibit B, and which at the same time would not only have the slot-opening, but also the end opening, the latter wider than the slot-opening, and therefore accommodating tickets that were wider than the ordinary theater-tickets. I began to revolve these different features in my mind about in December, 1898, and having settled in my mind the model I should adopt I went to Mr. Martin of the Rees Printing Company, in January, 1899, and directed him to cut out the model with both slot-opening and end opening, which I now hand to the notary and ask him to attach the same to my deposition, and mark it "Exhibit L." This model, Exhibit L, has been retained by me ever since January, 1899, with the exception of a short period when it was in the hands of my attorney, Mr. Bishop, at Washington.

The actions of Hauser have been in accordance with the policy of the law and within the spirit and purpose of the constitutional provision relating to the promotion of "the progress of science and useful arts."

Hauser is shown by the evidence to be the first to conceive, the first to reduce to practice, the first to come into the Patent Office with an application, and the only one to have a patent. In addition to this it is not shown beyond a reasonable doubt that between September, 1897, and April, 1899, during which time—namely, January to March, 1899—Loomis constructed the device and placed it before the public, that Hauser's actions were such as not to come within the "policy or objects of the Constitution or acts of Congress," and thereby to lose by his own acts his rights as prior inventor, and thereby not to entitle him to an award of priority.

Priority of invention is therefore awarded to George Hauser.

The decision of the Examiners-in-Chief is reversed.

Amendment of Section 4883, Revised Statutes, Relating to the Signing of Letters Patent.

DEPARTMENT OF THE INTERIOR,

UNITED STATES PATENT OFFICE,

Washington, D. C., April 12, 1902.

By the act approved April 11, 1902, section 4883, Revised Statutes, has been amended to read as follows:

Sec. 4883. All patents shall be issued in the name of the United States of America, under the seal of the Patent Office, and shall be signed by the Commissioner of Patents, and they shall be recorded, together with the specifications, in the Patent Office in books to be kept for that purpose.

F. L. ALLEN,
Commissioner.

Revision of Trade-Mark Rules.

(Under No. 1,000.)

DEPARTMENT OF THE INTERIOR,

UNITED STATES PATENT OFFICE,

Washington, D. C., April 5, 1902.

Rule 21, subdivision (b.) governing the registration of trade-marks, is hereby amended to read as follows:

(b) A statement specifying name, domicile, location, and citizenship of the party applying; the class of merchandise and the particular description of goods comprised in such class to which the particular trade-mark has been appropriated; a description of the trade-mark itself, and a statement of the mode in which the same is applied and affixed to goods, and the length of time during which the trade-mark has been used, and if the applicant be a corporation it must set forth under the laws of what State or nation incorporated.

F. L. ALLEN,
Commissioner.

Roster of Registered Attorneys.

An alphabetical list of the individuals and firms registered in this Office under the provisions of Rule 17 of the Rules of Practice, as amended August 6, 1897, corrected to January 8, 1903, has been published, and copies will be furnished at the price of ten cents each, two five-cent coupons being acceptable in payment therefor.

Registrants are requested to give notice of any errors that appear in the list as published or any change of address since the list was prepared for publication.

Any solicitor, agent, or attorney who, in circulars or advertisements or otherwise, refers to the Commissioner of Patents or to any other official of the Patent Office, for evidence of his professional standing, does so without authority.

Punctuation and Amendments.

Attention is called to Order 723, dated November 23, 1892, which is as follows:

It is hereby directed that in the printing of claims of applications for patents the punctuation of the claims as made by applicants be strictly followed, and that the punctuation of the specification made by applicants be not departed from except to cure a manifest absurdity.

This order is still in force.

Examiners are prohibited from making any change in the claims or specification of an application without the consent of applicants or their attorneys; but when amendment becomes necessary the Office will duly advise, by letter, the applicant or his representative before passing a case to issue.

PATENTS

GRANTED APRIL 15, 1902

897,426. CALCULAGRAPE. HENRY AMORY, New York, N. Y., assignor to Calculagraph Company, New York, N. Y., and East Orange, N. J., a Corporation of New Jersey. Filed May 28, 1900. Serial No. 17,578. (No model.)

Claim.—1. In combination with feed-reversing mechanism, a printing-ribbon, means for operating said mechanism to reverse the direction of feed of the ribbon, a frame or casing, an indicator on the exterior of the latter to show the direction of feed, and a second indicator on the exterior of the frame or casing to show when to reverse the feed, substantially as and for the purpose described.

2. In combination with an inked printing-ribbon, mechanism for moving said ribbon in opposite directions, mechanism for reversing the direction of movement of the ribbon, a frame, or casing, a rotatable operating-bar for the reversing mechanism, mounted in the frame or casing, and a bar movable by said rotatable bar and transmitting the motion thereof to the reversing mechanism, said bars having coating cam-faces, substantially as and for the purpose described.

3. In combination with an inked printing-ribbon, mechanism for moving said ribbon in opposite directions, a lever for reversing the direction of movement of said ribbon, a longitudinally-movable bar, connections between the latter and said lever, and a rotatable bar, said bars having coating cam-faces whereby the rotation of one controls the longitudinal movement of the other, substantially as and for the purpose described.

4. In combination with the feed-reversing mechanism of an inked ribbon used for printing purposes, a longitudinally-movable bar and a rotatable bar which are contained within a suitable housing and have their contiguous ends oppositely beveled, means for holding the former, with a yielding pressure at the inner limit of its motion, and means for giving to the latter a partial rotation, substantially as and for the purpose specified.

5. In a printing mechanism in which ink is supplied by a ribbon that is automatically moved longitudinally, in either direction, by the rotation of a wheel, a reversing mechanism consisting of a longitudinally-movable bar having one end pivoted to or upon a lever and its opposite end provided with a beveled section, a rotatable bar that is journaled in a housing, axially, with said longitudinally-movable bar and provided at its contiguous end with a beveled section, a spring that operates to hold said longitudinally-movable bar, with a yielding pressure, at the inner limit of its movement, means for operating said rotatable bar, and means for connecting said lever with device for reversing the rotary movements of the ribbon wheel, whereby a half-rotation of said rotatable bar will operate to press said longitudinally-movable bar to the limit of its outer motion and cause said inked ribbon to be fed in one direction, while a second half-rotation of said rotatable bar, will permit said longitudinally-movable bar to be returned to its normal position, so as to reverse the feed of said inked ribbon, substantially as shown.

6. In a printing mechanism in which ink is supplied by a longitudinally-movable inked ribbon that is simultaneously and alternately wound upon and from two spools, a device which bears upon the ribbon as wound upon one of said spools and, by the increase or decrease of the diameter

of such wound portion, indicates the longitudinal position of said ribbon, substantially as and for the purpose set forth.

7. In a printing mechanism in which ink is supplied by a longitudinally-movable inked ribbon that is located between the printing surface and platen, a pair of spools upon which the ribbon is alternately wound, a stud which is arranged vertically over one of the ribbon-spools with its lower end in contact with the ribbon wound thereon and its outer end extending through a stationary portion of the mechanism, whereby the quantity of ribbon wound upon said spool will be indicated by the relative positions of the outer end of said stud, substantially as and for the purpose shown and described.

8. In combination with an inked printing-ribbon, mechanism for moving said ribbon in opposite directions means for reversing the direction of movement of the ribbon, and a ribbon-actuated indicator to indicate when its movement should be reversed, substantially as and for the purpose specified.

9. In combination with an inked printing-ribbon, mechanism for moving said ribbon in opposite directions, means for reversing the direction of movement of the ribbon, a ribbon-actuated indicator to indicate when its movement should be reversed, and a direction-indicator for the reversing mechanism, substantially as and for the purpose specified.

897,427. CALCULAGRAPE. HENRY AMORY, New York, N. Y., assignor to Calculagraph Company, East Orange, N. J., and New York, N. Y., a Corporation of New Jersey. Filed Mar. 4, 1900. Serial No. 98,611. (No model.)

Claim.—1. In combination with a plate, a mechanism supported therefrom, an inclosing casing for the mechanism, threaded legs upon the interior of such casing, covers passing through said plate downward into the legs, a supporting-table, threaded pillars on the casing, and covers passing through such table into the threaded portions of the pillars, substantially as and for the purpose described.

2. In combination with the casing provided within opposite sides with vertical, laterally-threaded legs, the mechanism-supporting plate adapted to fit into and over the upper end of each casing, and provided within its lower face with recesses which are adapted to fit over the upper ends of the threaded legs, and covers which pass downward through said table and into the threaded interior of said legs, substantially as described.

3. In combination with a mechanism and its inclosing casing, pillars with threaded openings in their upper ends on the outside of the casing, and having at their lower ends legs that project beneath the casing, and covers for the threaded openings in the pillars, adapted to pass through a supporting-table, substantially as described.

4. In combination with the casing shown, a number of pillars having within their upper portions threaded openings and at their lower ends legs that project laterally beneath and are attached to the bottom of each

casing, which pillars are arranged at equidistant points around said casing and when the latter has its upper portion contained within an opening in a supporting-table at their upper ends, bear against the lower side of each table in position to each receive a screw which passes downward through the latter and operates to secure said casing firmly thereto, substantially as and for the purpose described.

697,428. HEATING-STOVE. THOMAS M. ANDERSON, New
Whitcomb, Wash. Filed June 10, 1901. Serial No. 63,345. (No model.)

Claim.—1. In a heating-stove, the combination with a fire-box and an ash-pit, of an upper compartment having partitions therein and communicatively connected with the said fire-box, a lower compartment having a series of cleaning-holes in the bottom thereof opening in the said ash-pit, means to simultaneously close all of said cleaning-holes, vertical tubes arranged concentric of the stove connecting said upper and lower compartments to form return-current channels for the passage of the combustion-gases therebetween, a rotatable circular plate or ring having an aperture therein and adapted to be rotated so as to move the aperture over and in line with each of the said vertical tubes, substantially as and for the purpose set forth.

2. In a heating-stove, the combination with a fire-box, an ash-pit, an upper compartment having partitions therein and communicatively connected with the said fire-box, a lower compartment having a series of cleaning-holes in the bottom thereof opening in the said ash-pit, vertical tubes arranged concentric of the stove connecting said upper and lower compartments; of means to simultaneously close all of the said cleaning-holes, and a rotatable circular plate or ring having an aperture therein adapted to be moved directly over and in line with each of the said vertical tubes for cleaning the same, substantially as described.

3. In a heating-stove, the combination with a fire box, an ash-pit, an upper compartment communicatively connected with the said fire-box, a lower compartment communicatively connected by a plurality of openings with said ash-pit, means to coincidentally close said communicative connections between said lower compartment and the ash-pit, and vertical tubes arranged concentrically of the stove connecting said upper and lower compartments; of a rotatable circular plate having a hole therein adapted to be used to give access for cleaning each of the said vertical tubes, substantially as and for the purpose set forth.

4. In a heating-stove, the combination with a fire-box, an ash-pit, an upper compartment communicatively connected with the said fire-box, a lower compartment communicatively connected by a plurality of openings with said ash-pit, means to coincidentally close said communicative connections between said lower compartment and the ash-pit, vertical tubes arranged concentrically of the stove connecting said upper and lower compartments, and a grate; of a rotatable circular plate having a cleaning-hole therein adapted to be used to give access for cleaning each of the said vertical tubes, substantially as and for the purpose set forth.

697,429. AUTOMATIC GRAIN-MOWER. JOHN F. APPLBY, Chicago, Ill., assignor to Deering Harvester Company, Chicago, Ill. Filed Nov. 28, 1900. Serial No. 37,795. (No model.)

Claim.—1. In a grain-binder, the combination with the packer-shaft, of a drive-shaft mounted in fixed relation to and rotating in the same direction as the packer-shaft, gears on said shafts, a swinging arm pivoted coaxially with the drive-shaft and carrying an intermediate gear normally meshing with both gears, a connection between the arm and a movable

part of the binder to swing the arm so as to disconnect the intermediate gear from the packer-shaft gear when the needles rise, and means for swinging the arm so as to cause the intermediate gear to roll around the drive-shaft gear into mesh with the gear on the packer-shaft when the needles fall, said packer-shaft gear and intermediate gear being provided with pitch-line chords to form stops to prevent them from being thrown too closely into mesh.

2. In a grain-binder, the combination with the packer-shaft, of a drive-shaft mounted in fixed relation to and rotating in the same direction as the packer-shaft, gears on said shafts, a rocking sleeve on the end of the drive-shaft that projects beyond the gears, an arm on one end of the sleeve carrying an intermediate gear meshing with the drive-shaft gear, a cam on the needle, and an arm projecting from the other end of the sleeve in the plane of movement of the cam.

697,480. TYPE-WRITING MACHINE. GLENN J. BARNETT, Grand Rapids, Mich., assignor to the Fox Machine Company, Grand Rapids, Mich. Filed June 12, 1900. Serial No. 29,002. (No model.)

Claim.—1. In a type-writing machine, the combination of the main frame A; a carriage B adapted to reciprocate thereon; a rack-shaft C with a suitable buffer at one end; a rack-bar D connected to said rack-shaft C by suitable arms; a rack-shaft E with arms L, L', thereon having connections L', L', to the finger-keys below to be actuated thereby; a dog-block F; a dog F on said dog-block adapted to engage in a fixed plane transverse to said rack-bar; a pivoted dog G having a locking-dog G' attached thereto; a plate H secured to the frame A of said machine and arranged to extend horizontally over the oscillating dog-block; and an arm I which is pivoted at r and adjustable between set-screws n, n, and ears H', H', on said plate H; and a stop I' positioned to engage the said locking-dog G' when the dog-block is actuated by depressing a key, all coacting substantially as described for the purpose specified.

2. In a type-writing machine the combination of the main frame A; a carriage B adapted to reciprocate thereon; a rack-shaft C; a rack-bar D connected to said rack-shaft C by suitable arms; a rack-shaft E with arms L, L', thereon having connections L', L', to the finger-keys below to be actuated thereby; a dog-block F; a dog F on said dog-block adapted to engage in a fixed plane transverse to said rack-bar; a pivoted dog G having a locking-dog G' attached thereto; a plate H secured to

the frame A of said machine and arranged to extend horizontally over the oscillating dog-block; and an arm I which is pivoted at r and adjustable between set-screws u, u, and ears H' H' on said plate H; and a stop I' positioned to engage the said locking-dog G' when the dog-block is actuated by pressing a key, all operating substantially as described for the purpose specified.

3. In a type-writer the combination of a carriage; a rack-bar; a dog-block; connections to the keys to operate the same; a dog normally engaging the rack-bar in a fixed plane transverse thereto; a pivoted dog to be moved into engagement with said rack-bar having suitable stops to limit its motion; an adjustable stop carried by the type-writer frame; and a locking-dog attached to said pivoted dog to be thrown into engagement with said stop when completing the stroke of the escapement mechanism to lock the carriage until the return movement thereof, for the purpose specified.

4. In a type-writing machine, the combination of a carriage; means of putting the same under tension; an escapement mechanism therefor, a dog in said escapement mechanism fixed in reference to the forward movement of the carriage and its connection; a vibrating dog movable in the direction of the movement of the carriage; a locking-dog, timed to engage the escapement mechanism and prevent the forward movement of the carriage only when a key is depressed to substantially the end of its stroke whereby the carriage will feed only when the key is in a partially-depressed position, either on the up or down stroke.

5. In a type-writing machine, the combination of a carriage; means of putting the same under tension; an escapement mechanism therefor, a dog in said escapement mechanism fixed, in reference to the forward movement of the carriage and its connection; a vibrating dog movable in the direction of the movement of the carriage; a laterally-adjustable locking-dog timed to engage the escapement mechanism and prevent the forward movement of the carriage only when a key of the machine is depressed to substantially the end of its stroke whereby the carriage will feed only when the key is in a partially-depressed position, either on the up or down stroke.

6. In a type-writing machine, the combination of the main frame of the machine; the carriage adapted to reciprocate thereon; a rack-bar carried by said carriage; an escapement consisting of a dog engaging in a fixed plane transverse to said rack-bar that normally engages the same and a dog pivoted to swing in the direction of said rack-bar; a locking-dog carried by said pivoted dog; a stop supported by the frame of the machine to be engaged by said dog; and suitable connections to the keys of the machine for actuating said escapement mechanism and throwing the dog into engagement with the stop whereby the escapement mechanism will not to release the carriage from normally engaging dog on the downstroke of the keys and the locking-dog to prevent the movement of the carriage until the return movement of the escapement mechanism, all operating for the purpose specified.

7. In a type-writing machine the combination of the main frame; a carriage adapted to reciprocate thereon; a rack-bar carried by said carriage; an escapement consisting of a dog engaging in a fixed plane transverse to said rack-bar, that normally engages the same and a dog pivoted to swing in the direction of said rack-bar; a locking-dog positioned and timed to lock the carriage after the operation of the escapement; suitable connection to the keys of the machine for actuating the escapement and throwing the locking-dog into engagement whereby the escapement will not to release the carriage on the downstroke of the keys, and the dog will prevent the movement of the carriage until the return movement of the escapement begins, operating for the purpose specified.

8. In a type-writing machine the combination of the main frame of the machine; a type-writer carriage reciprocating thereon; a rack-shaft supported on said carriage; a rack-bar carried by said rack-shaft; a suitable escapement for the said rack-bar; and a deadener at the end of said rack-shaft consisting of a screw a having a pivot a' thereon, with a shoulder between a washer c of leather or similar material, and a metallic washer c' between the said rod and washer c.

9. In a type-writing machine, having a carriage under tension, an escapement for controlling the movement thereof, comprising a rack and dogs cooperating therewith, said dogs being so arranged to allow a forward movement of the carriage during the depression of the finger-keys; and a lock positioned and timed to engage and lock the carriage against such forward movement, when the finger lever or key approaches the limit of its movement.

10. In a type-writing machine having a carriage under tension, an escapement for controlling the movement thereof, comprising a rack and dogs cooperating therewith, said dogs being so arranged to allow a forward movement of the carriage during the depression of the finger-keys; and a lock positioned and timed to engage and lock the carriage against such forward movement when the finger lever or key approaches the limit of its movement; and means for adjusting said lock so as to lock the

carriage at any point of the completing depression of said finger-key, substantially as described.

697,481. GASH-CORD PULLEY. JOHN W. HANCOCK and CHARLES T. HANCOCK, Ellsworth, Maine. Filed May 22, 1901. Serial No. 62,572. (No model.)

Claim.—1. A device of the class described comprising an open-ended tubular frame provided at its outer end with a flange to form a stop and having a pair of longitudinal incisions at its rear portion, the portion of the tube between the incisions being perforated and adapted to be bent outward to form an ear after the device has been placed in position, and a pulley arranged within the frame, substantially as described.

2. A device of the class described comprising an open-ended tubular frame having a longitudinal slot and provided at opposite sides thereof with internal flanges, said tubular frame being provided at its rear portion with a pair of longitudinal incisions, the portion of the tube between the incisions being perforated and adapted to be bent outward at right angles to form an ear, and a pulley located between the internal flanges, substantially as described.

3. A gash-cord pulley, comprising an open-ended tubular frame, having a longitudinal slot in the under side thereof, and internal flanges rising from the opposite edges of the slot, and a pulley mounted between the flanges.

4. A gash-cord pulley, comprising an open-ended tubular frame having a longitudinal slot formed in the bottom thereof and extending throughout the length of the frame, longitudinal internal flanges rising from the opposite edges of the slot, an outwardly-directed marginal flange at the front end of the frame, the top of the rear end of the frame having a pair of longitudinal incisions formed therein and a perforation provided in the portion of the frame between the incisions, said perforate portion being capable of being bent laterally outward to form an attaching-ear, and a grooved pulley mounted between the opposite flanges, the latter rising above the pulley and forming opposite guards for a gash-cord.

697,482. BRUSH-HOLDER. NORMAN C. RAMMETT and JOHN W. HILL, Lynn, Mass., assignors to the General Electric Company, a Corporation of New York. Filed Aug 21, 1900. Serial No. 29,042. (No model.)

Claim.—1. As an article of manufacture, a body for a brush-holder, comprising a casting consisting of similar and parallel end pieces connected by an angularly-disposed back for the brush, so that it may be used either for a right or a left hand holder, the body being open at the top, bottom and front, and the space included between the end pieces and the back being unobstructed with any integral parts of the brush-holder body.

2. As an article of manufacture, a body for a brush-holder, comprising a casting having an open-front receptacle for receiving the brush, and parallel extending end pieces which form the sides of the receptacle the said end pieces being provided with clamping-ears which are bent out to receive the supporting-rod, whereby the holder may be retained in place.

3. In a brush-holder, the combination of a base or body having a receptacle for receiving a brush, a means for moving the brush toward the commutator, and a coiled spring which presses directly against the brush.

4. In a brush-holder, the combination of a base having a brush-receptacle, a spring for forcing the brush against the commutator, and a spiral or clock spring which rests on one of the flans of the brush and forces it against the base.

5. In a brush-holder, the combination of a base having a brush-receptacle, a spring for pressing the brush against the commutator, and a second spring for forcing the brush into its proper place in the receptacle, which spring rests on the brush and is capable of an angular and also a twisting movement as the brush moves.

6. In a brush-holder, the combination of a base having a brush-receptacle, a spring for pressing the brush against the commutator, and a clock-spring which presses the brush against the base of the holder and is so arranged that it will move angularly to a greater or less extent as the brush moves up and down.

7. As an article of manufacture, a spring for a brush-holder, comprising a spiral of flat spring metal, which is surrounded by a tubular piece of metal that forms a bearing-surface.

8. As an article of manufacture, a spring for a brush-holder comprising a spirally-wound sheet of metal having a central sleeve and an insulating tube, the ends of said tube being turned inwardly to prevent it from slipping outwardly off from the spring.

9. In a brush-holder, the combination of a base having a brush-receiving receptacle, a shaft or stud extending parallel with said base, and a clock-spring which is mounted on the stud and presses the brush into engagement with the base.

10. In a brush-holder, the combination of a base-piece which is mounted on a suitable support and is provided with a brush-receptacle, a shaft, and a flat coiled spring which is sleeved on the shaft in such manner that it is free to rotate as the brush moves up and down.

11. In a brush-holder, the combination of a base having an open-front receptacle for receiving a plurality of brushes, a shaft which extends across the receptacle; a plurality of coiled springs mounted on the shaft and arranged to press the brushes against the base, each of said springs being capable of angular movement independent of the other or others.

12. In a brush-holder, the combination of a base having a receptacle for receiving a plurality of brushes, a stud extending across the front of the receptacle, a plurality of clock-springs coiled around said stud, each engaging with a brush and capable of a certain amount of angular movement, and spacers which are mounted on said stud for separating the springs.

13. In a brush-holder, the combination of a base having a brush-receptacle, a shaft or stud extending across the face of the receptacle, a coiled spring wrapped around the stud for holding the brush in position, and a head or guard which surrounds a portion of the spring and is secured to the stud.

14. In a brush-holder, the combination of an insulating-support, a metal end piece for said insulating-support, which is provided with a slot or groove, a brush-holder stud having a rectangular head, which head is mounted in the groove or slot, a spring for pressing the brush against the commutator, and a coiled spring which engages with and presses the brush against the base of the brush-holder.

15. In a brush holder, the combination of a base having a receptacle in which the brush is held in an angular position with respect to the commutator as distinguished from a holder in which the brush is radial, a clock-spring which at its periphery engages with and presses the brush against the base, and a spring-pressed arm for forcing the brush against the commutator.

16. In a brush-holder, the combination of a brush-receptacle, a coiled spring which presses the brush against the face of the receptacle, and a head which surrounds a portion of the spring, and protects it from wear caused by an adjacent brush.

17. In a brush-holder, the combination of a brush-receptacle, coiled springs for pressing the brushes against the face of the receptacle, and a head or protector which insulates the springs and extends across the receptacle and is provided with guide-pieces which hold the brushes in place when they tend to jump, but at no other time.

18. In a brush-holder, the combination of a brush-receptacle designed to receive a plurality of brushes, a clock-spring for pressing each brush against the face of the receptacle, a head or protector composed of a single casting which is provided with a receptacle for each brush, and means for securing the head or protector to the end piece of the brush-receptacle.

19. A brush-holder which comprises a casting having similar and parallel end pieces connected by an angularly-disposed back for the brush, a support mounted on the two end pieces, and a spirally-coiled spring-strip mounted on said support, to press the brush against the back of the casting.

697,488. BUCKLE-CHAFE. WILLIAM BARNHAM, Waterloo, Iowa.
Filed Sept. 2, 1901. Serial No. 74,894. (No model.)

Claim.—1. A buckle-fastener, composed of a chafe-plate having a loop, in combination with a spring-bar adapted to enter and engage said loop, as and for the purpose set forth.

2. A buckle-fastener for reins, composed of a rein having a slot, a

chafe-plate having a loop adapted to be inserted in said slot, and a spring-bar adapted to be inserted within said rein and through the loop of said chafe-plate, as and for the purpose set forth.

3. A buckle-fastener for reins, composed of a rein having a slot, a chafe-plate having a loop adapted to be inserted within said slot, and having a buckle-bearing, a buckle pivoted within said bearing, and a spring-bar adapted to pass within and engage the inner portion of said loop after the loop has been inserted within the slot in said rein, as and for the purpose set forth.

697,484. STEP STRUCTURE. EMERY W. BRADLEY, Buffalo, N. Y. Filed July 21, 1901. Serial No. 70,376. (No model.)

Claim.—1. A step structure comprised of strings having stepped upper edges, a perforate tread and riser body secured to the stepped edge of the strings, and cement bands and risers supported by and anchored to the said body.

2. A step structure comprised of sleepers, metallic stepped strings secured to the sleepers, a perforate tread and riser body secured to the strings, and cement bands and risers supported by and anchored to the said body.

697,485. BICYCLE-FORK. FREDERICK J. FLETCHER, Fitchburg, Mass., assignor to Mary Elizabeth Johnson, Fitchburg, Mass., executrix of Iver Johnson, deceased. Filed Nov. 9, 1900. Serial No. 695,940. (No model.)

Claim.—The combination in a bicycle-fork, of an arched crown-piece provided with a vertical, tubular boss *O'* at its central section and having reduced cheeks *E, E*, at its ends, tubular sides *B, B*, having their upper ends latching and braced to said cheeks, an arched brace *G* having a central hole *G'* and having its ends curved as at *G''* to fit the tube-

for sides B, B, and being braced thereto opposite said cheeks, and a tube D braced to the interior of said tubular base and having its lower end entering the hole G and braced to said curved base, substantially as described.

697,486. SLIDING-FRAME FRAME & BURN, East Orange, N. J., assignor of one-half to Charles C. Capeland, South Orange, N. J. Filed Aug. 14, 1904. Serial No. 72,100. (No model.)

Claim.—1. A slide-opening comprising, a frame, a depression in the frame, lugs extending from the frame, guides on the frame, a slide actuating in the said guides, a depression in the slide engaging the depression in the frame and on edge thereof.

2. A receptacle, an opening in the receptacle, a cover closing the said opening on a side, a frame and lugs thereon bent over the edges of the opening in the receptacle, a depression in the frame, a slide, a depression in the slide engaging the depression in the frame and on edge thereof.

3. A receptacle, an opening in the receptacle, a frame with lugs extending from its four inner edges, and other lugs extending from the frame, the lugs at the inner edges bent over the edges of the opening in the receptacle, and the other lugs pivoting the said receptacle, a depression in the frame, a slide extending over the frame, a depression in the slide engaging the depression in the frame and on edge thereof, a cover inclosing the slide and frame with the receptacle.

697,487. ROPE-LAYING MACHINE. WILLIAM C. BROWN, Boston, N. J. Filed Nov. 2, 1906. Serial No. 610,000. (No model.)

Claim.—1. In a rope-laying filar, the combination of three hollow journals, with hollow or tubular filar-arms on opposite sides of the intermediate hollow journal, means detachably connecting said intermediate journal with said hollow arms, means detachably connecting the hollow

journals at the ends of the filar with the respective hollow arms, said hollow arms opening through the means that connect them with the journals, a laying-top connected with the forward hollow journal, and means for supporting bobbins in the filar, substantially as described.

2. In a rope-laying filar, the combination of a hollow or perforated journal, and arms θ projecting therefrom, with circular heads or disks connected with said arms, hollow or tubular filar-arms connected with and opening through said heads or disks, and other circular heads or disks connected with the opposite ends of said hollow arms, said arms opening through said last-mentioned heads or disks, hollow journals connected with the last-mentioned heads or disks, means for supporting bobbins in the filar, and a laying-top connected with the forward journal, substantially as described.

3. In a filar, the combination of a hollow journal, arms θ projecting therefrom, a head between said arms and detachably connected therewith, a hollow journal at the end of the filar, hollow filar-arms, a head connected with the last-mentioned journal and with said filar-arms, said filar-arms opening through said heads, substantially as set forth.

4. In a filar, the combination of a hollow journal, arms θ carried thereby and projecting outwardly therefrom on opposite sides, a head interposed between each pair of said arms and detachably connected therewith, hollow journals on opposite sides of the central journal, arms θ carried by the last-mentioned journals, a head detachably connecting each pair of arms θ , and hollow filar-arms interposed between a pair of heads and opening through the heads, the filar-arms being detachably connected with the corresponding heads, substantially as described.

697,488. HAT AND COAT RACK. MARK BRAYNER, Philadelphia, Pa. Filed Dec. 6, 1901. Serial No. 64,905. (No model.)

Claim.—The combination in a hat and coat frame, of a pin driven into the said frame and projecting from it; of a slotted bar, held to the frame by the said pin, but adapted to slide in or out; of a filament on which to rest the slotted bar in a convenient position; of a series of folding bars, hinged to the slotted bar, and to each other; of filaments on each bar, to prevent the next bar from rotating in the wrong direction; of a mirror hinged to the extremity of the last folding bar; all substantially as set forth and for the purpose specified.

697,489. ELECTRIC-ARC LAMP. RUDOLF BRUNN, Koblenz, Germany. Filed Sept. 28, 1902. Serial No. 31,100. (No model.)

Claim.—1. In an electric-arc lamp, search-light, &c., the combination of a pair of downwardly-pointed parallel or converging carbon pencils containing a high percentage of metallic salts and a chamber surrounding the carbon ends for the purpose described and set forth.

2. In an electric-arc lamp, search-light, &c., the combination of a pair of downwardly-pointed parallel or converging carbon pencils containing a high percentage of metallic salts a chamber inclosing the carbon ends and a magnetic field arranged near the arc for the purpose described and set forth.

3. In an electric-arc lamp, search-light, &c., the combination of a

pair of downwardly-pointed parallel or converging carbons containing a high percentage of metallic salts and a reflecting agent arranged above the luminous arc to prevent upward movement of air for the purpose described and set forth.

4. In an electric-arc lamp the combination of a pair of downwardly-pointed parallel or converging carbons containing a high percentage of such metallic salts which give to the arc a high illuminating power and a magnetic field arranged near the arc for the purpose described and set forth.

697,440. WHEARE. GRAPES C. BUCKER, Hallowell, Me. Filed July 16, 1900. Serial No. 28,778. (No model.)

Claim.—In combination with shear-blades provided with handles, one having a lip and the other having two ears to receive said lip, openings through said ears and lip, a bolt adapted to pass through said openings together with a coil-spring surrounding the lower end of said bolt and a nut upon said bolt, substantially as described.

697,441. APPARATUS FOR EQUIPPING VEHICLE WHEELS WITH TIRES OF RUBBER OR OTHER ELASTIC MATERIAL. WILLIAM S. BUCKER, Akron, Ohio. Filed May 20, 1901. Serial No. 61,110. (No model.)

Claim.—1. A machine of the character indicated, the combination with a winding-drum having a bore formed therein and extending longitudinally of the drum, of an endwise-shiftable pin or member *u* extending transversely of the drum and having bearing in opposite walls of the bore and provided with an inwardly-facing shoulder *o'* arranged to clamp the tire-retaining wire to the drum, and means for shifting the said endwise-shiftable member, substantially as and for the purpose set forth.

2. In a machine of the character indicated, the combination, with a suitably-supported upright winding-drum having a bore or bore formed therein and extending longitudinally of the drum, and provided with two oppositely-arranged and registering apertures or holes *o'* and *o'* formed in the surrounding wall of the said bore, of an endwise-shiftable pin or member *u* extending transversely of the drum and engaging the said holes *o'* and *o'* and provided with an inwardly-facing shoulder *o'* arranged to clamp a tire-retaining wire to the drum, and means for shifting the said endwise-shiftable member, substantially as and for the purpose set forth.

3. In a machine of the character indicated, a winding-drum having a bore formed therein and extending longitudinally of the drum, of an endwise-shiftable pin or member *u* extending transversely of and having bearing within the drum and provided with an inwardly-facing shoulder *o'* arranged to clamp the tire-retaining wire to the drum, a wedge extending through and transversely of the said endwise-shiftable member, a screw within the said bore of the drum in position to operate the wedge, and screw-threads formed upon the surrounding wall of the said bore and engaged by the screw, substantially as and for the purpose set forth.

4. In a machine of the character indicated, the combination, with a suitably-supported upright winding-drum having a bore or bore extending from its upper end downwardly, screw-threads formed upon the upper portion of the surrounding wall of the said bore, two oppositely-arranged and registering lateral apertures or holes *o'* and *o'* formed in the said wall below the said screw-threads, and an outwardly-facing shoulder *o'* formed upon the surrounding wall of one of the said lateral holes or apertures, of an endwise-shiftable pin or member *u* extending transversely of the drum and engaging the said holes *o'* and *o'* and provided with a vertical slot *v'* and an inwardly-facing shoulder *o'* opposite the said shoulder *o'*, a wedge *w* extending through the slot in the endwise-shiftable member and arranged with its smaller end lowermost, and a screw engaging the said screw-threads and arranged to operate the wedge, all arranged and operating substantially as shown, for the purpose specified.

5. In a machine of the character indicated, the combination, with a supporting-bed *h* provided with a vertically-arranged stud *k'*, and a vertically-arranged tubular winding-drum having its lower end embracing the said stud and having screw-threads formed upon the upper portion of the surrounding wall of its bore, the two oppositely-arranged and registering lateral apertures or holes *o'* and *o'*, and the two outwardly-facing shoulders *o'* and *o'* arranged at the top and bottom, respectively, of one of the said lateral apertures or holes, of an endwise-shiftable pin or member *u* extending transversely of the drum and engaging the said holes *o'* and *o'* and provided with a vertical slot *v'* and two inwardly-facing shoulders *o'* and *o'* formed at the top and bottom, respectively, of the said endwise-shiftable member and arranged to clamp the tire-retaining bands against the said shoulders *o'* and *o'*, a wedge *w* extending through the slot in the endwise-shiftable member and arranged with its smaller end lowermost, and a screw engaging the said screw-threads of the surrounding wall of the bore of the drum and arranged to operate the wedge, substantially as and for the purpose set forth.

6. In a machine of the character indicated, two clamping mechanisms arranged a suitable distance apart laterally and adapted to clamp opposite ends, respectively, of a tire-retaining band or bands; two plates carrying the different clamping mechanisms, respectively, and capable of oscillating or swinging in a horizontal plane; a wheel-carriage arranged between and a suitable distance from the axes of the said plates and shiftable toward and from the said plates, and means whereby the said plates are automatically actuated in opposite directions, respectively, during the shifting of the wheel-carriage toward or from the said plates, and the arrangement of the parts being such that the two clamping mechanisms are caused to approach or recede from each other according as the wheel-carriage is shifted toward or from the said plates, substantially as and for the purpose set forth.

7. In a machine of the character indicated, two clamping mechanisms arranged a suitable distance apart laterally and adapted to clamp opposite ends, respectively, of a tire-retaining band or bands; two plates *g* and *t* carrying the different clamping mechanisms, respectively, and supported so as to render them capable of oscillating or swinging in a horizontal plane; a wheel-carriage arranged between and a suitable distance from the axes of the said plates and comprising two disks 12 and 14 arranged one above the other with open-ended recesses 13 and 15 formed in the opposing faces of the disks 12 and 14, respectively, and bars 16 and 17 engaging the recesses 13 and 15, respectively, and attached to the said plates *g* and *t*, respectively, substantially as and for the purpose set forth.

8. A machine of the character indicated, comprising a table; two suitably-supported rotary disks 12 and 14 shiftable forwardly and rearwardly upon the said table and having, respectively, the open-ended recesses 13 and 15 formed in their opposing faces at opposite sides, respectively, of the axes of the disks; a bed *h* arranged forwardly of the said table; a plate *g* swiveled or pivotally mounted upon the said bed and arranged to swing or oscillate in a horizontal plane; clamping means carried by the said plate; the slide *a* movable toward and from the plate *g*; means for operating the slide; a plate *t* swiveled or pivotally mounted upon the slide and arranged to swing or oscillate in a horizontal plane, clamping means carried by the said plate *t*, and two bars 16 and 17 engaging the said recesses 13 and 15, respectively, and attached to the said plates *g* and *t*, respectively, all arranged and operating substantially as shown, for the purpose specified.

9. A machine of the character indicated, comprising a horizontally-arranged table *g* provided centrally with a forwardly and rearwardly extending slot *y'*; a vertically-arranged stud *y'* extending through the said slot; two disks or collars 12 and 14 turnably embracing the said stud and having, respectively, the open-ended recesses 13 and 15 formed in their opposing faces, at opposite sides, respectively, of the stem; a bed *h* arranged forwardly of the said table; a plate *g* swiveled or pivotally mounted upon the said bed and arranged to swing or oscillate in a horizontal plane; clamping means carried by the said plate; a slide *a* movable toward and from the plate *g*; means for operating the slide; a

plate *i* swivelled or pivotally mounted upon the slide and arranged to swing or oscillate in a horizontal plane; clamping means carried by the said plate *i*, and two bars 16 and 17 engaging the said recesses 13 and 15, respectively, and attached to the plates *g* and *h*, respectively, all arranged and operating substantially as shown, for the purpose specified.

10. A machine of the character indicated, comprising a horizontally-arranged table *g* provided centrally with a forwardly and rearwardly extending slot *g'*; a vertically-arranged stem *g''* extending through the said slot; two disks or collars 13 and 14 loosely embracing the said stem and having, respectively, the two open-ended recesses 13 and 15, formed in their opposing faces at opposite sides, respectively, of the stem; two bars 16 and 17 engaging the recesses 13 and 15, respectively, and extending forwardly from the disks or collars; a bed *A* arranged forwardly of the said table; a plate *j* swivelled or pivotally mounted upon the said bed and capable of swinging or oscillating in a horizontal plane, which plate has two upright members *j'* and *j''* arranged at opposite sides, respectively, of the bar 16; clamping means over the said bar 16 between the said members *j'* and *j''* and comprising an upper jaw tiltable in a vertical plane and a relatively stationary lower jaw; means for attaching the said bar 16 to the said lower jaw; a slide *k* movable toward and from the said plate *j*; slideways for the slide; a plate *l* swivelled or pivotally mounted upon the slide so as to render the said plate *l* capable of swinging or oscillating in a horizontal plane, which plate has two upright members *l'* and *l''* provided at opposite sides, respectively, of the said bar 17; clamping means over the said bar 17 between the members *l'* and *l''* and comprising an upper jaw tiltable in a vertical plane and a relatively stationary lower jaw; means for attaching the said bar 17 to the last-mentioned lower jaw, all arranged and operating substantially as shown, for the purpose specified.

697,442. BOWLOCK. CHARLES H. BOWLOCK, Norwich, Conn. Filed Aug. 7, 1901. Serial No. 71,399. (No model.)

Claim.—In combination, is a bowlock, a plate having an enlargement *c* and threaded portion *b*, and a nut formed with upper and lower bearings for said plate, as set forth, also with internal threads *b'* and with an annular chamber *b''* that is above the lower bearing and is adapted to receive the plate-threads when the parts are assembled.

697,448. LEATHER-STRETCHING DEVICE. JOHN CALDWELL, Minneapolis, Minn., assignor to the W. S. Hott Company, Minneapolis, Minn., a Corporation. Filed Jan. 15, 1908. Serial No. 1,494. (No model.)

Claim.—1. In a stretching mechanism, the combination with a stretching-frame, of a stretcher-head provided with serrations on its surface, a series of independent leather-holders having means for attachment to short marginal portions of the leather, and a corresponding series of coupling devices loosely pivoted to the holders and permitting them to swing freely under tension, the coupling devices being adapted to be adjusted laterally and longitudinally upon and to engage each serrated surface, and means for locking said coupling devices in their adjusted position on said surface, substantially as set forth.

2. The combination with a stretcher-head provided with transverse serrations, of a series of leather-holders adapted to engage short marginal portions of the leather, and a corresponding series of coupling devices loosely pivoted to the holders and provided with teeth, whereby the coupling

devices may be adjusted laterally and longitudinally and connected with the serrations on the stretcher-head, substantially as set forth.

3. In combination in a leather-stretching mechanism, a frame; a sliding and a fixed head therein; leather-holders, comprising bodies provided with means for engaging the leather, and pivotally-connected shanks capable of independent adjustment and provided with teeth; and serrations on the stretcher-head for engaging said teeth, substantially as set forth.

4. In combination in a leather-stretching mechanism, a frame; a sliding and a fixed head therein; leather-holders, comprising bodies provided with means for engaging the leather, and pivotally-connected shanks capable of independent adjustment and provided with teeth; serrations on the stretcher-head for engaging said teeth; and means for holding the shanks in place thereon, substantially as set forth.

697,444. SAWDUST-BURNING STOVE. WILLARD F. CANOE and CHARLES F. WOOLLEY, West Mansfield, Ohio. Filed May 28, 1901. Serial No. 61,908. (No model.)

Claim.—1. In a stove of the class described, the combination with the body thereof, and a magazine-carried thereby, of a feed-slide arranged within said magazine and extending into the body for conveying the sawdust from the magazine to the body, a gate arranged within the magazine, air-inlets arranged within the body and communicating with the interior thereof, a heating-drum carried by the body and communicating therewith, a chimney-pipe communicating with said heating-drum, and a smoke-pipe arranged between the chimney-pipe and a magazine for conveying the products of combustion from the latter to the chimney-pipe.

2. In a stove of the class described, the combination with the body thereof, and a magazine carried thereby, of a feed-slide in said magazine and body, a gate therein for retarding the movement of the material fed upon the slide, an air-inlet pipe extending across the slide and having outlets into the interior of the stove, a heating-drum communicating with the body, a chimney thereon, and a pipe connecting said chimney and magazine.

697,445. ELECTRIC CONTROLLER. FRANK E. CASE, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed June 28, 1905. Serial No. 694,119. (No model.)

Claim.—1. The combination of a regulating-switch, a brake-switch, a reversing-switch, and a mechanical connection between the regulating and brake switches, such that movement of the regulating-switch handle brings the brake-switch into an operative position, and the further movement of the handle actuates only the regulating-switch.

2. The combination of a regulating-switch, a brake-switch, a reversing-switch, and a mechanical connection between the regulating and the brake switches, such that the movement of the regulating-switch handle brings the brake switch to one of two operative positions, and further movement of the handle actuates only the regulating-switch.

3. The combination, in a controller, of three separate cylindrical switches, two of which have a common axis, and a mechanical connection between the third switch and one of the other two, moving them simultaneously.

4. The combination in a controller, of a regulating-switch of cylindrical form, a reversing-switch and a brake-switch the axes of which are in line, and a mechanical connection between the regulating and brake switches.

5. The combination, with a motor-regulating switch of combined resistance-changing and series-parallel type, of a second switch mechanically connected thereto and having contacts by which, when the motor-regulating switch is moved in one direction from its off position, the circuits are established by the second switch for motor regulation, and when

moved in the opposite direction braking-circuits are established, including the resistance-changing contacts only of the power-switch.

6. The combination of the cam on the regulating-switch, the crank on the brake-switch, and a lever having its short arm operated by the cam and its long arm actuating the crank; whereby the brake-switch is brought to operative position before the contacts are closed at the regulating-switch, and further movement of the handle affects only the regulating-switch.

7. In an electric controller, the combination with a regulating-switch, of a separate brake-switch, a single actuating device for said switches, attached to said regulating-switch, and an independently-working reversing-switch.

8. In a controller, the combination with regulating and brake switches, of means for operating the regulating-switch, means for operating the brake-switch at a time when the regulating-switch being operative only by the operation of the regulating-switch, and an independently-working reversing-switch.

9. In a controller, the combination with regulating and brake switches, of an actuating-handle for the regulating-switch, means whereby the movement of the regulating-switch, exclusive of other means, operates the brake-switch at a time when the regulating-switch connections are broken, and an independently-working reversing-switch.

10. In a controller for dynamo-electric machines, the combination of a switch adapted to regulate said electric machines, both when operating as motors and as generators, a switch adapted to make connections whereby the machines are changed from motors to generators at a time when the connections of said regulating-switch are open, a single actuating means for said switches, and an independent reversing-switch.

11. In a controller for electric machines, the combination of a switch adapted to regulate said machines both when operating as motors and as generators, a switch adapted to change the mode of operation of said machines, a single actuating means for said switches, adapted to operate the brake-switch at a time when the connections of the regulating-switch are broken, and an independent reversing-switch.

12. In a controller for dynamo-electric machines, the combination of power and brake circuits for said machines, a regulating-switch adapted to be used in both the power and brake circuits, means for operating said switch, and a separate switch for connecting the machines to operate as motors or generators, said switch being adapted to be actuated only by the movement of the regulating-switch from its open position to its power or brake positions.

13. In a controller for dynamo-electric machines, the combination of power and brake circuits for said machines, a regulating-switch adapted to be used in both power and-brake circuits, means for operating said switch, a separate switch for connecting the machines to operate as mo-

tors or generators, and means whereby the said switch can be actuated only by the moving regulating-switch when the latter is passing over its off position.

14. In a controller for electric machines, the combination of power and brake circuits for said machines, a regulating-switch for both said circuits, a separate switch for causing the machines to operate as motors or generators, a single actuating-handle for said switches attached to the regulating-switch, a mechanical connection between said switches, whereby the said separate switch is actuated, and an independent reversing-switch.

15. In a controller for electric machines, the combination of power and brake circuits for said machines, a regulating-switch for both said circuits, a separate switch for causing the machines to operate either as motors or generators, a single actuating-handle for said switches attached to the regulating-switch, means controlled by said actuating-handle for operating said separate switch when the regulating-switch is in its off position, and an independent reversing-switch.

16. In an electric controller for power and brake circuits, the combination with a regulating-switch arranged to regulate the flow of current both in the power and in the brake circuit, of a reversing-switch, a separate brake-switch, and means for actuating the regulating-switch, said means also exclusively controlling the operation of the brake-switch.

17. In a controller for electric machines, the combination of a switch adapted to regulate said electric machines both when operating as motors and as generators, a switch adapted to make connections whereby the machines are changed from motors to generators, a single actuating means for said switches, and a third independently-operated switch adapted to change the direction of motion of said machines.

18. In an electric controller, the combination with a regulating-switch and a reversing-switch, of a brake-switch, means for actuating the regulating-switch, and a mechanical connection between the switches whereby alone motion is communicated to the brake-switch.

19. In a controller, the combination with a regulating-switch and a reversing-switch, of a brake-switch, means for actuating said regulating-switch, a mechanical connection between the regulating and brake switches, and guiding means on each switch adapted to engage the mechanical connection to intermittently and exclusively operate the brake-switch.

20. In a controller, the combination with a regulating-switch and a reversing-switch, of a brake-switch, means for actuating said regulating-switch, a mechanical connection pivoted independently of the switches, and guiding means on the regulating and brake switches adapted to engage the mechanical connection to intermittently operate the brake-switch.

21. In a controller, the combination with regulating, brake, and reversing switches, of means for actuating the former, cam-surfaces on the regulating-switch, a slotted crank on the brake-switch, and a mechanical connection between the switches adapted to engage with the cam and crank.

22. The combination with two electric switches, of supporting-shafts therefor, means for actuating one shaft, two cam-surfaces on the latter, a slotted crank on the other shaft, and an independently-pivoted lever adapted to engage with said cam and crank, whereby the driven shaft is partially rotated during a part of the rotation of the actuating-shaft.

23. The combination with two electric switches, of supporting-shafts therefor, means for actuating one shaft, two cam-surfaces on the latter, a slotted crank on the other shaft, and an independently-pivoted three-armed lever carrying a pin on one arm to engage with the slotted crank, and rollers on the other arms for engaging with the cam.

24. In a controller, the combination with a regulating-switch, actuating means therefor, a separate brake-switch, means whereby the latter is actuated by the operation of the regulating-switch, and an independently constructed and operated reversing-switch having its axis in the same line with that of the brake-switch.

25. In combination, in a controller having contacts for power and braking, a main switch provided with current-regulating contacts, and an auxiliary switch provided with circuit changing and equalizing contacts.

26. In combination, in a controller having contacts for power and braking, a main switch provided with current-regulating contacts, an auxiliary switch provided with circuit changing and equalizing contacts, and an independent reversing-switch.

27. In combination, in a controller having contacts for power and braking, a main switch comprising current-regulating and series-multiple contacts, and an auxiliary switch comprising circuit changing and equalizing contacts.

28. In combination, in a controller having contacts for power and braking, a main switch comprising current-regulating contacts, an auxiliary switch comprising circuit changing and equalizing contacts, and a mechanical connection between said switches.

29. In combination, in a controller having contacts for power and braking, a main switch comprising current-regulating contacts, an auxiliary switch comprising circuit changing and equalizing contacts, and a mechanical means whereby the auxiliary switch is thrown into one of its

operative positions by the movement of the main switch from its off position.

30. In combination, is a controller having contacts for power and braking, a main switch comprising current-regulating contacts, an auxiliary switch comprising circuit changing and equalizing contacts, and a mechanical means whereby the auxiliary switch is thrown into one of its operative positions by the initial movement of the main switch from its off position.

31. In combination, is a controller having contacts for power and braking, a main controlling-switch, an auxiliary controlling-switch, a reversing-switch, and a mechanical connection between the main and the auxiliary controlling-switches.

697,446. SPRAYER. WILLIAM E. CHANDLER, Chicago, Ill.
Filed Nov. 18, 1900. Serial No. 35,778. (No model.)

Claim.—A sprayer comprising a tank adapted to be carried within a vehicle, a vertical partition within the tank dividing it into a major and a minor compartment, an air-pump mounted in the minor compartment an air-tight cover upon the tank, a pipe passing from the base of the minor compartment and opening into the major compartment, a number of perforations in the pipe, a valve between the partition and the minor compartment, pipes extending vertically within the tank and passing outwardly therefrom at its upper end, arms projecting upwardly from the tank, a shaft journaled in the arms, disks mounted upon the shaft adjacent the arms, a cam mounted between the disks and having connection with the piston-rod of the air-pump, said rod being passed through a perforation in the air-tight cover, a sprocket-wheel upon the shaft, a sprocket-wheel carried by the running-gear of the vehicle, a chain connecting the two sprockets, a bar connected to the tank and extending laterally therefrom at two opposite sides, slots in the ends of the bar, yokes adjustably mounted upon the bar and adapted to receive the sides of the vehicle-body and cut-aways mounted in the yokes to hold them firmly in position.

697,447. PORTABLE SCAFFOLD. EDWARD CHASTRAUD, Chicago, Ill.
Filed Jan. 27, 1902. Serial No. 61,866. (No model.)

Claim.—1. In a scaffold, the combination of a standard, a cleave thereon having an arm projecting upwardly and spaced from the standard, and a ledger supported upon the cleave having a bracket-receiving said arm.

2. In a scaffold, the combination with standards, of a bracket on a standard having an upwardly-extending arm spaced from the standard, a ledger supported on the bracket between the arm and the standard having a socket receiving said arm, and a cleave-coupling for the standards supported by the ledger.

697,448. FAN. WALTER E. GUNNMAN, New York, N. Y. Filed July 12, 1901. Serial No. 67,908. (No model.)

Claim.—1. The combination with an electric motor M, and fan F, of the guard G, the series of slats D, pivotally supported in said guard G, and means for automatically moving said deflectors or slats D, by the direct action of the motor, substantially as herein set forth.

2. The combination of the electric motor M, the fan F, the guard G, a series of pivoted slats D, and mechanism for transmitting motion from the motor-shaft m, to said deflectors D, for the purpose and substantially in the manner described.

697,449. HYDRAULIC BARBER-CHAIR. TIMOTHY J. COLLIER, Toledo, Ohio. Filed Dec. 20, 1901. Serial No. 67,907. (No model.)

Claim.—1. In a hydraulic base for a chair, the combination with a cylinder adapted to be mounted vertically on a base and having a rack-bar secured vertical to its inner wall, of a tubular piston for the cylinder having a vertical longitudinal groove in its outer wall to receive the rack-bar as a guide for the vertical movement of the piston in the cylinder and prevent its rotation therein, and having its lower end closed and provided with a port normally closed by a check-valve; a locking-bar secured to the piston and normally engaging the rack-bar; a pump-plunger for the base of the piston; means to reciprocate the plunger in the piston; means to disengage the locking-bar from the rack-bar by the downward stroke of the plunger; and means to automatically reengage it therewith during the upward stroke of the plunger.

2. In a hydraulic base for a chair, the combination of a cylinder closed at the bottom and adapted to be mounted vertically on a base; a rack-bar secured vertical to the inner wall of the cylinder; a tubular piston for the cylinder having a vertical longitudinal slot to receive the rack-bar as a guide for the vertical movement of the piston in the cylinder and prevent its rotation therein, and having its lower end closed and provided with a port normally closed by a check-valve; a locking-bar normally secured to the lower end of the piston and held normally in engagement

ment with the rack-bar when the valve is closed, and adapted to be disengaged therefrom by the check-valve when the valve is opened; a pump mechanism mounted on the piston having a plunger adapted to reciprocate in the bore of the piston forming a barrel for the pump, and to open the check-valve by its downward stroke and disengage the locking-bar from the rack-bar; and means to automatically reengage the locking-bar with the rack-bar during the upward stroke of the plunger.

3. In a hydraulic base for a chair, the combination of a cylinder closed at the bottom and adapted to be mounted vertically on a base; a rack-bar secured vertical to the inner wall of the cylinder; a tubular piston for the cylinder having a vertical longitudinal slot to receive the rack-bar as a guide for the vertical movement of the piston in the cylinder and prevent its rotation therein, and having its lower end closed and provided with a part; a pump mechanism mounted on the piston having a plunger adapted to reciprocate in the bore of the piston, forming a barrel for the pump; a spring-closing check-valve for the part in the piston adapted to be opened by the downward stroke of the plunger; a spring-pressed locking-bar movably secured to the lower end of the piston and held normally in engagement with the rack-bar by the spring when the valve is closed, and adapted to be disengaged therefrom by the check-valve when the valve is opened; and a pump mechanism mounted on the piston having a plunger adapted to reciprocate in the bore of the piston, forming a barrel for the pump, and to open the check-valve by its downward stroke and disengage the locking-bar.

4. In a hydraulic base for a chair, the combination of a cylinder closed at the bottom and adapted to be mounted vertically on a base; a rack-bar secured vertical to the inner wall of the cylinder; a tubular piston for the cylinder having a vertical longitudinal slot to receive the rack-bar as a guide for the vertical movement of the piston in the cylinder and prevent its rotation therein, and having its lower end closed and provided with a part; a pump mechanism mounted on the piston having a plunger adapted to reciprocate in the bore of the piston, forming a barrel for the pump; a spring-closing check-valve for the part in the piston adapted to be opened by the downward stroke of the plunger; a spring-pressed locking-bar movably secured to the lower end of the piston and held normally in engagement with the rack-bar by its spring and having a central aperture with an inclined wall; and an axial projection from the valve extending through the aperture of the locking-bar, having an inclined face adapted to engage the incline of the locking-bar and withdraw the bar from its engagement with the rack-bar when the valve is opened by the plunger.

5. In a barber-chair, the combination with a support for the chair-body, rotatably mounted on a hydraulic base provided with a pump mechanism adapted to raise and lower the body of the chair, of locks respectively adapted to automatically lock the chair-body against rotation, and in various reclined positions; a shaft journaled in the support, adapted to be longitudinally shifted in its bearings between fixed limits; arms mounted on the shaft in position to unlock the locks when the shaft is shifted to its limit in one direction, a collar provided with an arm adapted to reciprocate the pump-plunger, loosely mounted on the shaft and adapted to be engaged by a clutch fixed on the shaft, when the shaft is shifted to its opposite limit; a spring-pressed locking-pin normally engaging the pump-arm collar, and locking it against movement and adapted to be automatically disengaged therefrom by the clutch, when brought into engagement with the collar, and a lever for oscillating the shaft.

6. In a barber-chair, the combination with a support for the chair-body, rotatably mounted on a hydraulic base provided with a pump mechanism adapted to raise and lower the body of the chair, of locks respectively adapted to automatically lock the chair-body against rotation, and in various reclined positions; a shaft journaled in the support, adapted to be longitudinally shifted in its bearings between fixed limits; arms mounted on the shaft in position to unlock the locks when the shaft is shifted to its limit in one direction, a collar provided with an arm adapted to reciprocate the pump-plunger, loosely mounted on the shaft and adapted to be engaged by a clutch fixed on the shaft when the shaft is shifted to its opposite limit; a lever for oscillating the shaft; and a leaf-spring adapted to be secured by one end to the chair-body and having the other end extending into an elongated slot in the shaft adapted to return the lever to its normal position when oscillated in either direction therefrom.

897,460. MAIL-BILL. ALBERT F. SUMNER, New Britain, Conn., assignor to Curtis United Lock Company, New Britain, Conn., a Corporation of Connecticut. Filed Feb. 21, 1901. Serial No. 42,987. (No model.)

Claim.—1. A tubular mail-box closed at one end and having an attached door at the opposite end, and means for pivotally supporting said box at a point between its ends whereby the box is permitted to move in a vertical plane.

2. A self-signaling mail-box comprising a tubular shell closed at one end and having an attached door at its opposite end, and a pivotal connection between the box and a suitable support secured to one side of the tubular shell at a point between its extremities, substantially as described and for the purposes set forth.

3. A box hung pivotally and adapted by swinging on its pivot to occupy different positions in combination with spring-steps for its different adjustments, all substantially as described and for the purposes set forth.

4. In combination the round box pivotally hung and provided with an end door, said box being adapted, by swinging on its pivot, to occupy different positions in combination with spring-steps for its different adjustments, all substantially as described and for the purposes set forth.

897,461. MIDDLEBURY-FURIFIER. ALBERT S. CHASE, West Superior, Wis. Filed May 6, 1900. Serial No. 716,719. (No model.)

Claim.—1. A separator comprising concentrically-arranged upper and lower hoppers in open communication, a fan connected at its outlet-port with the upper hopper and a discharge-pipe leading from said fan to the lower hopper, a series of rings arranged below the upper hopper and spaced apart, a deflector in the lower hopper interposed between the fan-discharge opening and said rings and surrounding all of said rings, a discharge-spout below said rings leading out of the lower hopper, and a feed-spout opening into the upper hopper, substantially as described.

2. A separator comprising concentrically-arranged upper and lower hoppers in open communication, a fan connected at its outlet-port with the upper hopper and arranged to discharge into the lower hopper, a series of rings arranged below the upper hopper and spaced apart, a deflector in the lower hopper interposed between the fan-discharge opening and said rings, a discharge-spout below said rings leading out of the lower hopper, a revolving disk below the discharge end of the feed-spout, a floating lever pivoted at one end and suspended by a spring at its opposite end, a floating feed-hopper mounted on said lever and arranged to discharge into the feed-spout, a sleeve upon the discharge end of the feed-spout suspended from a second lever, said lever being fixedly pivoted at one end, and a cord trained around a pulley and connecting the other end of said lever with the free end of the floating lever, substantially as described.

3. The combination with a separator and means for maintaining a circulation of air therethrough, of a feed-spout, a revolving disk below the discharge end of the feed-spout, a floating lever pivoted at one end and suspended by a spring at its opposite end, a floating feed-hopper mounted on said lever and arranged to discharge into the feed-spout, a sleeve upon the discharge end of the feed-spout suspended from a second lever, said lever being fixedly pivoted at one end, and a cord trained around a pulley and connecting the other end of said lever with the free end of the floating lever, substantially as described.

897,462. CAR-TRUCK. BENJAMIN A. CHASE, New York, N.Y. Filed Aug. 22, 1901. Serial No. 73,600. (No model.)

Claim.—1. In a car-truck, the side frame, the connecting-beam, the springs, and the bolster seated at its ends on said springs, combined with means pivotally connecting said bolster and beam and admitting of the vertical movement of said bolster; substantially as set forth.

2. In a car-truck, the side frame, the connecting-beam, the springs, and the bolster seated at its ends on said springs, combined with the

bolster seated on said bolster, and the bolster seated on said beam, one of said bolsters having the horizontal pivot-pin, and the other having the slot engaging said pin; substantially as set forth.

3. In a car-truck, the side frame, the connecting-beam therefor, the springs, and the bolster seated at its ends on said springs, combined with means intermediate said bolster and beam for permitting the tilting or turning of said bolster in a direction laterally of the truck and at the same time allowing said bolster to yield vertically; substantially as set forth.

4. In a car-truck, the bolster, and the springs supporting said bolster at its ends, combined with means for restraining said bolster against endwise movement and permitting said bolster to have a pivotal or rocking motion; substantially as set forth.

897,463. CORNERED TAIL AND KERN GUARD. CHARLES DANIEL, Spencer, Mass. Filed Feb. 27, 1901. Serial No. 68,104. (No model.)

Claim.—1. The combination with a crupper having its members provided each with a clip, of a combined tail and kern guard substantially circular in form and of greater diameter than the crupper, the terminals of the guard being passed through the clips and bent to prevent rotation that would operate to hold the guard associated with the clips.

2. The combination with a crupper provided on the upper side of its terminals with clips, of a tail-guard comprising a piece of wire bent in substantially circular form to include the crupper but of greater diameter than the same, the terminals of the wire being passed through the clips and bent upon themselves to prevent rectangular rotation, the clips being held associated with the wire-guides by the vertically-disposed members thereof, substantially as set forth for the purposes specified.

897,464. METHOD FOR ADJUSTING BELLS TO PULLEY. JAMES W. BRYAN, Chicago, Ill. Filed May 24, 1901. Serial No. 81,316. (No model.)

Claim.—1. A belt-adjuster comprising two pieces of metal of substantially equal lengths placed one upon the other, there being an elongated slot in each of said pieces, a bolt carried by each of said pieces and engaging the slot in the opposing piece, fastening-nuts applied to said bolts, and gripping-arms carried by said pieces, substantially as described.

2. A belt-adjuster comprising two pieces of metal of substantially equal lengths placed one upon the other, there being an elongated slot in each of said pieces, a bolt carried by each of said pieces and engaging the slot in the opposing piece, fastening-nuts applied to said bolts, a pulley-gripping arm carried by one of said pieces, a belt-engaging arm carried by the other of said pieces, and being for said pulley-gripping arm, substantially as described.

3. A belt-adjuster comprising two pieces of metal of substantially equal lengths placed one upon the other, there being an elongated slot in each of said pieces, a bolt carried by each of said pieces and engaging the slot in the opposing piece, fastening-nuts applied to said bolts, a pulley-gripping arm carried by one of said pieces, a belt-engaging arm carried by the other of said pieces, a being for said pulley-gripping arm, and a handle applied to the belt-engaging arm, substantially as described.

4. A belt-adjuster comprising two pieces of metal of substantially equal lengths placed one upon the other, there being an elongated slot in each of said pieces, a bolt carried by each of said pieces and engaging the slot in the opposing piece, fastening-nuts applied to said bolts, a pulley-gripping arm carried by one of said pieces, a belt-engaging arm carried by the other of said pieces, a being for said pulley-gripping arm, and a handle applied to the belt-engaging arm, substantially as described.

897,465. AXLE-SPINDLE. THOMAS DE LA MARRE, Toledo, Ohio. Filed Aug. 20, 1901. Serial No. 73,900. (No model.)

Claim.—The combination of an axle provided with an enlargement forming a shoulder at its inner end and having a curved outer face, and a sleeve arranged on the axle and provided with an arm or extension having a curved recess to receive the enlargement, said sleeve being adapted to be partially rotated to engage the arm or extension with the enlargement and to disengage it therefrom, substantially as described.

897,466. LIGOTYPE-MACHINE. PHILIP T. DODGE, Washington, D.C., assignor to Ligotyper-Lithograph Company, a Corporation of New York. Filed Feb. 17, 1902. Serial No. 94,004. (No model.)

Claim.—1. A distributing mechanism having an upward inclination in the direction in which the matrices travel.

2. The distributor-bar inclined upward toward the delivery end, in combination with means for carrying the matrices upward along said bar.

3. The combination of the inclined distributor-bar and adjacent feed-covers, correspondingly inclined.

4. The inclined distributor-bar and the inclined elevator, in combination with means for carrying the matrices upward along the elevator toward the distributor.

5. In a ligotype-machine, a distributor inclined upward in the direction of matrix travel, in combination with matrix-carrying channels thereunder and matrices dovetailed at the lower end as described.

6. The inclined distributor-bar, in combination with an adjacent feed-cover, having its threads vertically disposed on the side adjacent to the bar.

897,467. GAME APPARATUS. ALBERT R. DUNN, Philadelphia, Pa. Filed Sept. 20, 1901. Serial No. 76,813. (No model.)

Claim.—1. A game apparatus comprising a rail having tapered extremities and an intermediate groove, and a bat having a reduced end adapted to engage the groove.

2. A game apparatus comprising a rail having tapered extremities and an intermediate circumferential groove, and a bat having a reduced end adapted to engage the groove.

3. A game apparatus comprising a cat having tapered extremities and an intermediate circumferential groove, and a bat having a rounded flattened end to engage the groove.

697,458. ELECTRIC LAMP AND LAMP-HOLDER. RICHARD J. DOWNS, London, England. Filed Oct. 28, 1901. Serial No. 28,522. (No model.)

Claim.—In combination, a tubular lamp-holder, or socket, a pair of split spring-plugs within the same, the edge of the holder projecting beyond the ends of the plug, a lamp having a neck adapted to telescope within said tubular holder, and metal contact-tubes embedded in the insulating material in the stem of the lamp, said plug being adapted to slide into and make perfect contact with said contact-tubes, substantially as described.

697,459. APPARATUS FOR UNRAILING RAW COTTON. RANSEN BARNES, Charles-Owen-Barry, near Manchester, and EDWARD R. MANNING, Middlesbrough, near Manchester, England. Filed Aug. 5, 1901. Serial No. 70,561. (No model.)

Claim.—1. In a machine of the type herein referred to a drawing-off roller driven by the rolling contact of the bale itself in combination with supports on which it is mounted, said roller being free to descend under the action of gravity as the bale descends in close proximity to the upper face of the bale substantially as and for the purpose set forth and shown.

2. In an unrailing-machine of the type herein referred to the combination with a drawing-off roller of a stripping-plate, means for securing said roller and plate together and means for mounting and guiding them, although leaving them free to descend by gravity in close proximity to the upper face of the bale substantially as and for the purpose set forth and shown.

697,460. TOOTH FOR REEDERS AND CULTIVATORS. EDWARD J. EDWARDS, La Crosse, Wis., assignor to Fountain City Bell Company, La Crosse, Wis. Filed Oct. 19, 1901. Serial No. 73,278. (No model.)

Claim.—1. The combination with drag-bar, of a spindle having bearings in said drag-bar, a tooth pivoted at one end to the drag-bar, a spring yoke or frame hinged between its ends on said spindle, links connecting one end of the yoke or frame with the tooth, a block secured to the drag-bar, and a spring normally holding the free end of said yoke or frame against said block.

2. The combination with drag-bar, of an angular spindle having bearings in said drag-bar, a tooth pivoted at one end to the drag-bar and having a horizontal series of holes therein, a spring yoke or frame hinged between its ends on said spindle, links connecting one end of the yoke or frame with any one of the holes in the tooth, a stop-block adjustably secured between the drag-bar, a spring secured to the spindle, coiled around the same and holding its other end against the said block and adapted to normally hold the free end of the yoke or frame against said block.

3. The combination with drag-bar, of an angular spindle having bearings in said drag-bar, a tooth pivoted at one end to the drag-bar, a spring yoke or frame hinged between its ends on said spindle, links connecting one end of the yoke or frame with the tooth, a stop-block adjustably secured between the drag-bar, inclined flanges at the ends of said block for regulating the position of said yoke or frame, and a spring normally holding one end of the yoke or frame against said inclined flanges.

697,461. GAS-BURNER. WILLIAM BARNES, Memphis, Tenn. Filed Aug. 31, 1901. Serial No. 74,048. (No model.)

Claim.—1. In a gas-burner, the combination with an independent mantle and a suitable support therefor, of a contracted gas-inlet, a conical-shaped air-inlet tube above said gas-inlet, perforations around the bottom of said air-inlet tube, an enlarged mixing-chamber fixed to the upper end of said air-inlet tube and an upwardly-converging conical nozzle for said mixing-chamber, substantially as shown and described.

2. In a gas-burner, the combination with an independent mantle

and a suitable support therefor, of a contracted gas-inlet, a conical-shaped air-inlet tube concentrically located above said gas-inlet, perforations around the bottom of said air-inlet tube, an enlarged mixing-chamber fixed to the upper end of said air-inlet tube and an upwardly-converging conical nozzle for said mixing-chamber, substantially as shown and described.

3. In a gas-burner, the combination with an independent mantle and a suitable support therefor, of a contracted gas-inlet, a conical-shaped air-inlet tube above said gas-inlet, perforations around the bottom of said air-inlet tube, an enlarged mixing-chamber fixed to the upper end of said air-inlet tube, a gas screen over the upper end of said chamber, and an upwardly-converging conical nozzle for said mixing-chamber, substantially as shown and described.

4. In a gas-burner, the combination with an independent mantle and a suitable support therefor, of a contracted gas-inlet, a conical-shaped air-inlet tube concentrically located above said gas-inlet, perforations around the bottom of said air-inlet tube, an enlarged mixing-chamber fixed to the upper end of said air-inlet tube, a gas screen over the upper end of said chamber, and an upwardly-converging conical nozzle for said mixing-chamber, substantially as shown and described.

5. In a gas-burner, the combination with an independent mantle and a suitable support therefor, of a contracted gas-inlet, an upwardly-converging conical-shaped air-inlet tube above said gas-inlet, perforations around the bottom of said air-inlet tube, an enlarged mixing-chamber fixed to the upper end of said air-inlet tube and an upwardly-converging conical nozzle for said mixing-chamber, substantially as shown and described.

6. In a gas-burner, the combination with an independent mantle and a suitable support therefor, of a contracted gas-inlet on upwardly-converging conical-shaped air-inlet tube concentrically located above said gas-inlet, perforations around the bottom of said air-inlet tube, an enlarged mixing-chamber fixed to the upper end of said air-inlet tube and an upwardly-converging conical nozzle for said mixing-chamber, substantially as shown and described.

7. In a gas-burner, the combination with an independent mantle and a suitable support therefor, of a contracted gas-inlet on upwardly-converging conical-shaped air-inlet tube above said gas-inlet, perforations around the bottom of said air-inlet tube, an enlarged mixing-chamber fixed to the upper end of said air-inlet tube, a gas screen over the upper end of said chamber, and an upwardly-converging conical nozzle for said mixing-chamber, substantially as shown and described.

8. In a gas-burner, the combination with an independent mantle and a suitable support therefor, of a contracted gas-inlet on upwardly-converging conical-shaped air-inlet tube concentrically located above said gas-inlet, perforations around the bottom of said air-inlet tube, an enlarged mixing-chamber fixed to the upper end of said air-inlet tube, a gas screen over the upper end of said chamber and an upwardly-converging conical nozzle for said mixing-chamber, substantially as shown and described.

9. An improved Bunsen burner, for producing a self-burning mixture of air and gas, composed of an upwardly-converging hollow air-inlet cone into which the gas and air are admitted, a suddenly-enlarging mixing-chamber fixed to the top of said cone and an upwardly-converging conical nozzle, substantially as described.

10. An improved Bunsen burner, for producing a self-burning mixture of gas and air, composed of an upwardly-converging hollow air-inlet cone into which the air and gas are admitted, a suddenly-enlarged mixing-chamber carried by said air-inlet cone to check the flow of gas and air and cause their thorough admixture, and an upwardly-converging conical nozzle, to concentrate the flame, substantially as shown and described.

697,462. FUMIGANT-TRAP FOR SAWYER. RANSEN BARNES, Weymouth, Wis. Filed Aug. 9, 1901. Serial No. 71,027. (No model.)

Claim.—1. In a saw, the combination with the main shell having a cavity, of an inner removable receptacle, removable means for holding the inner receptacle against removal, a handle for the inner receptacle removably mounted thereon, a spring-pressed jaw mounted for movement to

clamp against the handle and having a retaining means for holding it retracted, and connection between the handle and the retaining means for actuating the latter to release the spring-pressed jaw when the handle is moved with respect to the receptacle.

2. The combination with a receptacle of a trap including a movable handle, a jaw for movement to clamp against the handle, means for actuating the jaw, and a latch for holding the jaw retracted, said latch being contracted and arranged to release the jaw when the handle is moved with respect to the receptacle.

3. In a saw, the combination with the main shell having a cavity, of a receptacle removably disposed in the cavity, a removable bolt for retaining the receptacle, said receptacle having an opening in its front wall, a plate within the receptacle, a handle attached to the plate and passed outwardly through the opening, a spring-pressed jaw adapted to engage and exert a clamping action against the handle, and a latch-pivot pivoted to the plate for holding the jaw retracted, said latch having a beveled portion for engagement with a wall of the slot of the receptacle to move it pivotally and release the jaw.

4. The combination with a receptacle having a movable handle, of a spring-pressed jaw contracted and arranged to engage the handle, and retaining means for holding the spring-pressed jaw retracted, said retaining means having connection with the handle for actuation thereby to release the spring-pressed jaw when the handle is moved.

697,463. SHIPPING-PACKAGE. JEREMY T. FANNIN, Anderson, Ind., assignor to J. W. Fannin Manufacturing Company, Anderson, Ind., and Chicago, Ill., a Corporation of Indiana. Filed Aug. 13, 1901. Serial No. 71,781. (No model.)

Claim.—1. A shipping-package comprising an outer wooden crate and an inner lining composed of a series of four separate disengageable interlocking paper boards forming the top and bottom and the end and side walls, substantially as described.

2. A shipping-package comprising an outer wooden crate and an inner lining composed of a series of separate interlocking corrugated paper boards, the top and bottom being connected respectively with the front and rear side walls; substantially as described.

3. A shipping-package comprising an outer wooden crate and an inner lining of disengageable corrugated paper boards provided with interlocking flanges operating to hold the several boards of the lining in position; substantially as described.

4. A shipping-package comprising an outer crate and an inner lining formed of four separate pieces, two of said pieces constituting the end walls of the lining, another the bottom and front wall thereof hinged together, and the fourth the top and rear wall likewise hinged together and permitting said top to be swung upward to open position and downward to closed position; substantially as described.

5. A shipping-package comprising an outer crate and an inner lining formed of four separate pieces, two of said pieces constituting the end walls of the lining and the other two constituting, respectively, the bottom and front wall, and the top and rear wall, thereof, the rear wall being provided along its lower edge with an internal locking-flange resting upon the rear edge of the bottom of the lining, and the front wall being provided upon its upper edge with an internal flange to support the forward edge of the top of the lining in closed position; substantially as described.

6. A shipping-package comprising an outer crate and an inner lining formed of four separate pieces, two of said pieces constituting the end walls of the lining, and the other two constituting, respectively, the bottom and front wall, and the top and rear wall, thereof, and certain of said pieces being provided with locking-flanges operating to hold the several parts of the lining in position and prevent inward movement thereof; substantially as described.

7. A shipping-package comprising an outer crate and an inner lining composed of the two end pieces B B, the bottom E with the vertical front wall F hinged thereto and provided at its upper edge with the flange f, and the rear wall D having the top O hinged to its upper edge and provided at its lower edge with the flange f resting upon the rear edge of the bottom E; substantially as described.

8. A shipping-package comprising an outer crate and an inner lining composed of the two end pieces B B, the bottom E provided with the end flanges e e and having hinged to its forward edge the front wall F provided with like end flanges e e, the rear wall D provided with the end flanges e e and having hinged to its upper edge the top O provided with like end flanges e e, said end flanges e e being cut away at right angles to each other at their adjacent ends so that when the lining is assembled within the crate they will abut against each other and lock the top, bottom and sides of the lining against inward movement; substantially as described.

9. A shipping-package comprising an outer crate and an inner lining composed of the two end pieces B B, the bottom E provided with the end flanges e e and having hinged to its forward edge the front wall F provided with like end flanges e e and also with the flange f along its upper edge, and the rear wall D provided with the end flanges e e and bottom flange f and having hinged to its upper edge the top O provided with the end flanges e e and adapted to rest at its forward edge, when in closed position, upon the flange f at the upper edge of the front wall F; substantially as described.

10. The herein-described crate-lining, composed of four separate pieces, two of said pieces being duplicates of each other and constituting the end walls of the lining, and the other two pieces being also duplicates of each other and constituting, respectively, the bottom and front wall, and the top and rear wall, of said lining, the top being hinged to the upper edge of the rear wall so as to swing upward to open position or downward to closed position; substantially as described.

11. The herein-described crate-lining composed of four separate pieces, two of said pieces being duplicates of each other and constituting the end walls of the lining, and the other two being also duplicates of each other and constituting, respectively, the bottom and front wall of the lining with a longitudinal flange projecting from the upper edge of the front wall, and the rear wall and top of the lining with a longitudinal flange projecting from the bottom of the rear wall, the top being hinged to the upper edge of the rear wall so as to swing upward to open position or downward to closed position; substantially as described.

12. The herein-described crate-lining composed of four separate pieces, two of said pieces being plain flat boards constituting the end walls of the lining, and the other two pieces being duplicates of each other and constituting, respectively, the bottom and front wall of the lining, each provided with end flanges, and the top and rear wall of the lining, each also provided with end flanges, said end flanges being cut away at right angles to each other at their adjacent ends so as to abut together when the lining is assembled within the crate and lock the top, bottom and sides of the lining from inward movement; substantially as described.

13. The herein-described crate-lining composed of four separate pieces, two of said pieces being plain flat boards constituting the end walls of the lining, and the other two pieces being duplicates of each other and constituting, respectively, the bottom and front wall of the lining, each provided at its upper edge with a longitudinal flange, and the rear wall provided at its lower edge with a longitudinal flange adapted to rest upon the rear edge of the bottom of the lining, said end flanges of the top, bottom and sides being cut away at right angles to each other so as to abut together when the lining is assembled within the crate and lock said parts from inward movement; substantially as described.

14. A shipping-package comprising an outer crate and an inner lining formed of two separate end pieces and two substantially similar pieces of two parts each hinged together, one of which pieces forms the bottom and one side wall and the other of which forms the opposite side wall and the top; substantially as described.

15. The herein-described crate-lining composed of four separate pieces, two of said pieces being duplicates of each other and constituting the end walls of the lining and the other two of said pieces also being duplicates of each other and constituting respectively the bottom and one side wall and the top and the other side wall; substantially as described.

16. The herein-described crate-lining composed of four separate pieces adapted to interlock and thereby form a supported unitary structure within the crate, two of said pieces being duplicates of each other and constituting the end walls of the lining and the other two of said pieces also being duplicates of each other and constituting respectively the bottom and one side wall and the top and the other side wall; substantially as described.

17. The herein-described crate-lining composed of four separate pieces two of said pieces being duplicates of each other and constituting the end walls of the lining and the other two of said pieces also being duplicates of each other and constituting respectively the bottom and one side wall and the top and the other side wall, said latter two pieces having flanges beveled at their ends to abut against each other when the lining is in position; substantially as described.

697,464. WHEELWRIGHT-MACHINE. FRANK W. FARR. Filed July 10, 1901. Serial No. 68,513. (No model.)

Claim.—1. In a wheelwright-machine the combination with a cutting mechanism, of a clamp for moving said cutting mechanism to a spoke, the said clamp having a plurality of seats or ribs for the attachment of said cutting mechanism whereby the latter may be adjusted for cutting a spoke, or the felly between spokes.

2. In a wheelwright-machine, the combination of a clamp to be secured to a spoke, a rod connected to said clamp, means for adjusting the rod to different positions on the clamp in a direction at right angles to the axis of the rod, a shaft carried by said rod, means on said shaft for securing a cutting-tool thereto, means for turning said shaft and means for moving the shaft longitudinally.

3. In a wheelwright-machine, the combination of a clamp to be secured to a spoke, a rod connected to said clamp, and disposed at right angles thereto, means for adjusting the rod to different positions on the clamp at right angles to the axis of the rod, a shaft carried by said rod, means on said shaft for securing a cutting-tool thereto, a crank for turning the shaft, and a lever pivoted between its ends and connected at one end to the shaft to move the latter toward or away from the spoke or wheel.

4. In a wheelwright-machine, the combination of a clamp to be secured to a spoke, a transverse rib on said clamp, a rod having a longitudinal slot to receive the rib, the said rod being adjustable longitudinally on the rib, means for locking the rod to the clamp, a rod adjustably secured to the outer end of the sliding rod and provided with bearings, a shaft mounted in said bearings and carrying a cutting-tool, a lever pivoted to the sliding rod at a point in rear of the clamp, and a link connecting said lever and shaft.

5. In a wheelwright-machine, the combination with a bar to be secured on a spoke, ribs on said bar, a rod slotted to receive either of said ribs, means for securing the rod on the ribs, another rod projecting at right angles to said first-mentioned rod and having a bearing for a shaft, means on said shaft for securing a cutting-tool thereto, means for turning said shaft, a lever pivoted between its ends on said first-mentioned rod and a link connecting one end of the lever with a collar loose on the shaft.

6. In a wheelwright-machine, the combination with a clamp to be secured on a spoke, a rod mounted on the clamp at right angles thereto, another rod adjustably secured to the outer end of said first-mentioned rod and bifurcated at one end, bearings in the bifurcated members of said last-mentioned rod, a shaft mounted in said bearings, a crank secured to the outer end of the shaft, a block on the inner end of the shaft to receive either a transverse or a bearing rib, a collar loose on the shaft, a lever pivoted between its ends on said first-mentioned rod, a link connecting said lever and collar and means for securing the first-mentioned rod at different adjustments on the clamp at right angles to the axis of the rod, to dispose the collar in line with a spoke, or in line with the tire between two spokes.

697,465. PROCESS OF MAKING CAUSTIC ALKALI. HAN A. FRANK, New York, N. Y. Filed Jan. 6, 1902. Serial No. 58,968. (No specimens.)

Claim.—1. An improvement in the process of making alkali, which consists in absorbing ammonia in a solution of a salt of an alkali, and adding thereto an acid of a metal capable of reacting with the ammonia and producing the alkali.

2. An improvement in the process of making caustic alkali, which consists in absorbing ammonia in a solution of a salt of an alkali, and adding thereto an acid of a metal capable of reacting with the ammonia and producing the caustic alkali.

3. The method of making caustic soda, consisting in absorbing ammonia in a solution of sodium salt, and converting the sodium salt into caustic soda by the addition of an acid of alkali.

4. The method of making caustic soda, consisting in absorbing ammonia in a solution of sodium chloride, adding thereto alcohol-hydrochloric acid, thereby producing caustic soda and alcohol-ammonium chloride, separating the latter from the caustic-soda solution, dissolving it in water, adding calcium hydroxide, and recovering the ammonia by distillation, and repeating the alcohol acid by suitable means, such as filtration.

697,466. RAILWAY-CAR BOLSTER. HARRY W. FARR, Detroit, Mich. Filed Jan. 21, 1901. Serial No. 68,561. (No model.)

Claim.—1. A railway-car bolster having its ends tapered on top and bottom, the metal of each end being reduced whereby the same amount of metal is retained at the ends, but the cross-section is substantially the same as that of the body portion.

2. A railway-car bolster having its ends tapered on top and bottom, in combination with another superposed bolster having its ends tapered on the bottom, the metal of each end being reduced whereby the same amount of metal is retained on the ends, but the cross-section is substantially the same as that of the body portion.

697,467. GATCH FOR PUMPS OR GAS FRAMES. ALBERT F. FOLLAN, Newark, N. J., assignor to the J. H. Margott Company, a Corporation of New Jersey. Filed Oct. 16, 1901. Serial No. 70,774. (No model.)

Claim.—1. In a pump or bag frame, the combination, with a pair of frame-sections, of a holding-rod on one of said frame-sections, and a holding projection or rod on the other of said frame-sections, said hold-

ing-rod comprising a cap-shaped plate, a finger-piece on said plate, a marginal projection on said plate with which said rod is adapted to be brought in holding engagement, a downwardly-projecting member on said holding-rod, extending through an opening in said frame-section, said downwardly-projecting member having a cut-away part 17, a holding-bag on said downwardly-projecting member, bent at a right angle thereto, or approximately so, and a spring secured to said frame-section, on arm 11 on said spring having its free end extending into said cut-away part 17, and a spring-tongue 10 in engagement with the said bag, substantially as and for the purposes set forth.

2. In a pump or bag frame, the combination, with a frame-section having a dotted part, of a holding-rod provided with a downwardly-projecting holding member extending through said dotted part, said downwardly-projecting member having a cut-away part 17, a holding-bag on said downwardly-projecting member, bent at a right angle thereto, or approximately so, and a spring secured to said frame-section, a short arm 11 on said spring having its free end extending into said cut-away part 17, and a spring-tongue 10 in engagement with the said bag, substantially as and for the purposes set forth.

3. In a pump or bag frame, the combination, with a frame-section having a dotted part, of a holding-rod provided with a means of pivotal connection extending through the said dotted part, and a spring secured at one end to the inner portion of said frame-section, on arm 11 on said spring having its free end in engagement with said means of pivotal connection for the oscillation of said holding-rod, and a spring tongue or arm 10 also in engagement with a portion of said means of pivotal connection of the said holding-rod, substantially as and for the purposes set forth.

4. The herein-described holding-rod for a pump or bag frame, comprising a cap-shaped plate 12, a finger-piece on said plate, a downwardly-projecting holding member 16 on said cap-shaped plate, and an inwardly-extending leg 10 on said member 16, substantially as and for the purposes set forth.

5. The herein-described holding-rod for a pump or bag frame, comprising a cap-shaped plate 12, a finger-piece on said plate, said finger-piece consisting, essentially, of a member 20, a rivet for securing said member to said plate, and a cap 21 on said member 20, a downwardly-extending holding member 16 on said cap-shaped plate, and an inwardly-extending leg 10 on said member 16, substantially as and for the purposes set forth.

697,468. VEGETABLE-PULLER. WILLIAM GALARRAGA, Bay City, Mich. Filed June 12, 1901. Serial No. 64,664. (No model.)

Claim.—1. In a vegetable-puller of the class described, the combination of a beam, a combined collar and standard, a horizontally-disposed shoe at the lower end of said combined collar and standard, a puller secured on the shoe at the ends thereof, said puller being disposed on one side of said combined collar and standard, having its center portion raised and inclining downwardly toward its ends, and a point at the front end of said shoe and puller, substantially as described.

2. In a vegetable-puller of the class described, the combination of a beam, a combined standard and collar secured thereto, a horizontally-disposed shoe at the lower end of said combined collar and standard, a puller extending in front and rear of said combined collar and standard, said puller secured to the ends of said shoe, said puller being disposed on one side of said combined collar and standard, having its front portion forming an ascending plane, and its rear portion forming a descending plane, and a point secured on the ascending front portion of said puller and on the front portion of said shoe, substantially as described.

697,469. METHOD OF MANUFACTURING INCANDESCENT ELECTRIC LAMPS. EDGAR S. GARDNER, Boston, Mass., assignor to Barnstable Electric Manufacturing Company, Portland, Me., a Corporation of Maine. Filed July 22, 1901. Serial No. 68,182. (No specimens.)

Claim.—1. The method of manufacturing incandescent electric

lamps, which consists, first, in inserting a reflector within the bulb, second, in passing through said reflector the stem carrying the filament, third, in moving the stem and reflector into position, fourth, in sealing the stem to the neck of the bulb, fifth, in exhausting the bulb, and lastly, in closing the tip.

2. The method of manufacturing incandescent electric lamps, which consists, first, in inserting through the end opposite the neck the reflector, second, in inserting through the end opposite the neck the stem carrying the filament, third, in passing said stem through said reflector, fourth, in moving the stem and reflector up into position, fifth, in sealing the stem to the neck of the bulb, sixth, in exhausting the bulb, and lastly, in closing the tip.

3. The method of manufacturing incandescent electric lamps, which consists, first, in cutting off the end of the bulb opposite the neck, second, in inserting the reflector through the open end opposite the neck, third, in inserting through the open end opposite the neck the stem carrying the filament, fourth, in passing said stem through said reflector, fifth, in moving the stem and reflector up into position, sixth in sealing the stem to the neck of the bulb, seventh, in exhausting the bulb, and lastly, in closing the tip.

697,470. FOLZHEIM. MILTON W. GAYNE, Cincinnati, Ohio. Filed Dec. 27, 1901. Serial No. 87,466. (No model.)

Claim.—In a pulley, the combination with a rigid block or body provided at or near one end with a pivoted loop and at or near its other end with a spring-clamp comprising torsional coil-spring portions received within a recess with which the lower face of the said body is provided, of a cushion attached to the lower face of said block or body, and a doubled strip of flexible material covering said cushion and removably attached to the said block or body by means of the said pivoted loop and spring-clamp.

697,471. DRAWER-GUIDE. WILLIAM E. HICKER, San Francisco, Cal. Filed Nov. 14, 1901. Serial No. 88,291. (No model.)

Claim.—In combination with a sliding drawer and its case, relatively narrow guide-strips A, hinged at their forward ends and adapted to bear against the drawer sides at points approximately midway between the top and bottom edges thereof, and devices for forcing the strips into contact with the sides of the drawer, each comprising an elongated flat metallic spring B curved intermediate of its ends to the inner surface of the wall of the case and having its respective ends projecting outwardly adjacent to the back of its strip, and means for securing said strip to the ends of said spring to permit automatic adjustment of the strip and a sliding engagement of both ends of the springs therewith, said means comprising U-shaped staples C secured to the strips and loosely surrounding the spring ends at each end thereof, substantially as described.

697,472. COOKING UTENSIL. HARRY GRIMM, Chicago, Ill. Filed Nov. 9, 1900. Renewed Mar. 10, 1902. Serial No. 88,981. (No model.)

Claim.—1. A cooking utensil comprising a receptacle, a cover hinged on said receptacle, a ball pivotally mounted on said cover, having its middle portion offset to form a handle, hooks formed on the ends of said ball, practically diametrically opposite said handle, adapted to be depressed as said handle is raised, legs on said receptacle adapted to be engaged by said hooks as said handle is raised, and a projection on said ball adapted to strike said cover as said ball is raised to prevent same from being turned past an upright position.

2. A cooking utensil comprising a receptacle, a cover hinged on said receptacle, a ball pivotally mounted on said cover, having its middle portion offset to form a handle, a projection on said handle portion adapted to hold said handle slightly above said cover when said ball is in its normal position, hooks formed on the ends of said ball, practically diametrically opposite said handle, adapted to be depressed as said handle is raised, legs on said receptacle adapted to be engaged by said hooks as said handle is raised, and a projection on said ball adapted to strike said cover as said ball is raised to prevent same from being turned past an upright position.

697,478. GARBAGE OR REFUSE CAN. EDWARD R. GEMAN, New York, N. Y., assignor to the Iron Can Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Jan. 22, 1901. Serial No. 84,368. (No model.)

Claim.—1. A nesting garbage or refuse can, having tapered side walls and provided with stop-faces integral with and projecting from said tapered walls and located in position to rest or bear upon the top or edge of another can of the same size and construction, and handles located above the said stop-faces, the said stop-faces serving as a means whereby the said cans may be loosely nested and also serving to separate the handles on adjacent cans so that a large free space is provided between the handles of adjacent cans.

2. A nesting refuse-can having tapered side walls and provided with means located in position to bear or rest upon the top or edge of another can of the same size and construction and integral with and projecting beyond the normal wall of the can and forming upper and lower walls merging into the lower wall of the can, and a hoop or band intermediate said upper and lower walls and effective to equalize the load.

3. A nesting refuse-can having tapered side walls and provided with means located in position to bear or rest upon the top or edge of another can of the same size and construction and integral with and projecting beyond the normal wall of the can and forming upper and lower walls merging into the lower wall of the can, and a hoop or band intermediate said upper and lower walls and effective to equalize the load, said hoop or band having its inner face substantially flush with the inner wall of the can whereby a substantially continuous and unobstructed inner surface is provided.

697,474. BABY-WALKER. CHARLES G. GLASSCOCK and JOHN W. GLASSCOCK, Minnola, Ind. Filed July 9, 1901. Serial No. 87,871. (No model.)

Claim.—1. In a baby-walker, the combination with a base-ring, of a body-ring located above the base-ring, and a standard connecting the base and body rings, said standard having an inwardly-extending arm provided with laterally-yieldable portions at its ends, the inner yieldable portion being connected to the body-ring, and the outer yieldable portion being secured to the base-ring, whereby said body-ring may yield laterally and vertically with respect to the base-ring.

2. In a baby-walker, the combination with a base-ring, of a body-ring located above the base-ring, a standard connecting the rings and comprising a stem depending from the body-ring, a stem projecting above the base-ring, and an intermediate offset portion having a yielding connection with said stems.

3. In a baby-walker, the combination with a base-ring, of a body-ring located above the base-ring, and a standard connecting the rings, said standard comprising a stem depending from the body-ring, a stem projecting above the base-ring, an intermediate offset arm, and coiled springs connecting the ends of the arm and the free ends of the stems.

4. In a baby-walker, the combination with a base-ring, of a body-ring located above the base-ring, a standard connecting the rings and comprising a stem depending from the body-ring and having an eye at its upper end secured thereto, a stem projecting above the base-ring and having a screw-threaded shank at its lower end passing through said base-ring, and an intermediate offset arm having a yielding connection with the free ends of said stems.

697,476. CLAMPING DEVICE FOR WORK-BENCHES. RICHARD G. MAER, Kunkirshen, Germany. Filed Dec. 13, 1901. Serial No. 88,303. (No model.)

Claim.—A clamping device for work-benches, comprising a jaw or clamping-bar C guided in a frame fixed to the bench in a suitable manner, a crank-shaft A mounted in the frame and by which the jaw may be moved, the crank-pin being connected to the movable jaw by means of the coiled spring F which is secured to the guiding-bar by regulating-screw e, a handle for throwing the crank from one dead-center to the other and a stop for said crank slightly past the outer dead-center.

697,476. CASH-REGISTER. PHILIP F. GANN, Chicago, Ill. Filed May 14, 1901. Serial No. 88,171. (No model.)

Claim.—1. In a cash-register or similar machine, a series of counters or

scorers adapted to be manually engaged and moved into scoring or counting position in a group containing one or more of such counters or scorers, and means for locking the remaining counters or scorers against movement while the advance counters or scorers remain in advanced position, as and for the purpose set forth.

2. In a cash-register or similar machine, a series of counters or scorers adapted to be manually engaged and moved into scoring or counting position in a group containing one or more of such counters or scorers, in combination with means for locking said counters or scorers in advanced or counting or scoring position, as and for the purpose set forth.

3. In a cash-register or similar machine, a series of counters or scorers adapted to be manually engaged and moved into scoring or counting position in a group containing one or more of such counters or scorers, means normally tending to return said counters or scorers to initial position, means for locking said counters or scorers in counting or scoring position, and means for releasing said lock, as and for the purpose set forth.

4. In a cash-register or similar machine, a series of counters or scorers adapted to be moved into scoring or counting position in a group containing one or more of such counters or scorers, means normally tending to return said counters or scorers to initial position, means for locking said counters or scorers in counting or scoring position, and means for releasing said lock, as and for the purpose set forth.

5. In a cash-register or similar machine, a series of counters or scorers adapted to be moved into scoring or counting position in a group containing one or more of such counters or scorers, means for locking said counters or scorers in counting or scoring position, and means for releasing said lock, as and for the purpose set forth.

6. In a cash-register or similar machine, a series of counters or scorers adapted to be moved into scoring or counting position in a group containing one or more of such counters or scorers, means normally operating to return said counters or scorers to initial position, means for retaining said counters or scorers in counting or scoring position, and means for releasing said lock, as and for the purpose set forth.

7. In a cash-register or similar machine, a series of counters or scorers adapted to be manually engaged and moved into scoring or counting position in a group containing one or more of such counters or scorers, means for locking the advanced counters or scorers in counting or scoring position, and means for locking the remaining counters or scorers in initial position, as and for the purpose set forth.

8. In a cash-register or similar machine, a series of counters or scorers adapted to be moved into counting or scoring position in a group containing one or more of such counters or scorers, means whereby when a group of such counters or scorers is moved to counting or scoring position the remaining counters or scorers are locked, and means operated by the return of the advanced counters or scorers for releasing said lock, as and for the purpose set forth.

9. In an apparatus of the class described, a support, a series of counters or scorers mounted to move relatively to said support, and a corre-

spending series of locking devices whereby when any one or more of the counters or scores are moved into counting or scoring position the remaining counters or scores are locked against movement, as and for the purpose set forth.

10. In an apparatus of the class described, a support, a series of counters or scores mounted thereon and adapted to be manually engaged and moved therealong, a locking device arranged when any one or more of such counters or scores are moved into counting or scoring position to lock the remaining counters or scores against movement into counting or scoring position, as and for the purpose set forth.

11. In an apparatus of the class described, a support, a series of counters or scores mounted thereon for movement relatively thereto, a stop device pivotally mounted upon said support and so arranged that when one or more of said counters or scores is moved into counting or scoring position the remaining counters are locked against movement toward or into counting or scoring position, as and for the purpose set forth.

12. In an apparatus of the class described, a series of counters or scores mounted thereon for movement therealong, a corresponding series of stop devices pivotally mounted upon said support, said stop devices operating, when any one or more of said counters or scores are moved toward counting or scoring position, to lock the remaining counters or scores against movement into counting or scoring position, as and for the purpose set forth.

13. In an apparatus of the class described, a support, a series of counters or scores mounted for movement thereon, a part pivotally suspended upon said support and arranged to yield in one direction, a stop pin for limiting the rocking movement of said part in the opposite direction, as and for the purpose set forth.

14. In an apparatus of the class described, a support, a series of counters or scores mounted thereon for movement therealong, a corresponding series of locking-pawls pivotally suspended from said support and arranged a distance apart corresponding to the transverse thickness of a counter or score, as and for the purpose set forth.

15. In an apparatus of the class described, a support, a series of movable counters or scores mounted thereon for movement therealong, a corresponding series of locking-pawls pivotally suspended from said support, said counters or scores arranged to engage said pawls, said pawls being arranged to yield in one direction, and means for flexing a stop for said pawls in the opposite direction, as and for the purpose set forth.

16. In an apparatus of the class described, a support, a series of counters or scores mounted thereon, a locking device carried by said support, a rod connected to said locking device, one of said counters or scores arranged to engage said rod, when in counting or scoring position, to lock the same against movement, as and for the purpose set forth.

17. In an apparatus of the class described, a support, counters or scores mounted for movement thereon, movable stops suspended from said support, a rod connecting said stops, and means arranged to engage said rod when one or more of said counters or scores are in counting or scoring position, to lock the same, as and for the purpose set forth.

18. In an apparatus of the class described, a support made in relatively movable sections, a series of counters or scores mounted upon said support, one of said sections adapted to receive said counters or scores when out of counting or scoring position, and the other of said sections adapted to receive said counters or scores when in counting or scoring position, to bring devices for locking said counters or scores in counting or scoring position, and means actuated by the movement of said movable sections for releasing said lock, as and for the purpose set forth.

19. In an apparatus of the class described, a support, counters or scores mounted for movement thereon, locking devices for holding said counters or scores in counting or scoring position, and including a movable bar, means for engaging said bar when one or more counters or scores are in counting or scoring position, for locking the same against movement, and means for releasing said bar from locking position, as and for the purpose set forth.

20. In an apparatus of the class described, a support, a series of counters or scores mounted thereon, the first or initial counter or score provided with a projection, means for locking said counter or score in counting or scoring position, including a movable bar, said bar arranged to engage said projection, and means for moving said bar out of engaging relation with respect to said projection, as and for the purpose set forth.

21. In an apparatus of the class described, a support made in relatively movable sections, a series of counters or scores mounted for movement upon said support, locking devices carried by one section of said support for locking said counters or scores in initial position, and locking devices carried by the other section of said support for locking said counters or scores in counting or scoring position, and means actuated by the movement of said movable sections for releasing said locking mechanism, as and for the purpose set forth.

22. In an apparatus of the class described, a support having a stationary section and a relatively movable section, a series of counters or scores mounted for movement upon said support, locking-pawls pivotally suspended from said supporting-sections and arranged to engage said counters or scores to lock the same, and means for moving said movable section whereby the locking-pawls carried thereby are released, as and for the purpose set forth.

23. In an apparatus of the class described, a support, a series of counters or scores mounted thereon including an initial or primary counter, means normally operating to maintain said initial or primary counter or score in retracted position, whereby all of said counters or scores are retained normally in retracted position, stop devices for said score, whereby when any one or more of said counters are moved from said initial or retracted position the remaining counters are locked against movement, and means for locking said initial or primary score in advanced position, as and for the purpose set forth.

24. In an apparatus of the class described, a support, a casing including said support, a series of counters or scores mounted on said casing for movement therealong, said casing being slotted, said counters provided with projections extending into said slot, and stop devices carried by said support, as and for the purpose set forth.

25. In an apparatus of the class described, a hollow or tubular casing, a series of counters or scores arranged to be strung upon said casing for movement therealong, and stop devices carried by said casing, as and for the purpose set forth.

26. In an apparatus of the class described, a hollow casing, a support arranged therein and including a stationary section and a movable section, stop devices carried by said sections, and counters or scores mounted upon said casing and movable therealong, and arranged to be engaged and locked by said stop devices, as and for the purpose set forth.

27. In an apparatus of the class described, a hollow or tubular casing, a stationary supporting-section mounted therein, a rocking supporting-section also mounted within said casing, stop devices carried by each of said supporting-sections, a series of counters or scores adapted to be strung upon said casing, and means for rocking said supporting-section, as and for the purpose set forth.

28. In an apparatus of the class described, a support, a series of counters or scores movably mounted thereon and each provided with a handle whereby said counters or scores may be grasped and moved with reference to said support and into counting or scoring position, and means for locking said counters or scores in counting or scoring position, as and for the purpose set forth.

29. In an apparatus of the class described, a support, a series of counters or scores movably mounted thereon and each provided with a grasping-handle, said grasping-handles being arranged in staggered relation, whereby said counters or scores may be moved into counting or scoring position, locking devices for locking said counters or scores when advanced to counting or scoring position, and means for releasing said locking devices, as and for the purpose set forth.

30. In an apparatus of the class described, a support, a series of counters or scores movably mounted thereon and each provided with indicating devices, means for moving said counters or scores into counting position, locking devices for locking the same in advanced or scoring position, and means for releasing said locking mechanism, as and for the purpose set forth.

31. In an apparatus of the class described, a support, a series of indicators arranged to move thereon, each counter or score carrying an indicating device adapted to disclose the value thereof to denote the amount of the purchase, and means whereby each counter or score when in counting or scoring position will conceal the indicator of the preceding counter or score, as and for the purpose set forth.

32. In an apparatus of the class described, a support, a series of counters or scores sliding thereon for movement therealong, and adapted to be moved from initial or normal position into counting or scoring position, an indicator-plate mounted on each counter or score, the indicator-plate of each counter or score being arranged to lap past the indicator-plate of the preceding counter or score when said counters or scores are in counting or scoring position, as and for the purpose set forth.

33. In an apparatus of the class described, a support, a series of counters or scores mounted thereon for movement therealong, an indicator-plate carried by each counter or score, said indicator-plates being of S shape in cross-section, whereby when the counters or scores are in counting or scoring position the indicator-plates of each counter or score will conceal the indicator-plate of the preceding counter or score, as and for the purpose set forth.

34. In an apparatus of the class described, a support, a series of counters or scores mounted thereon for movement therealong, and adapted to be moved from initial or retracted position into advanced or counting or scoring position, means for locking the counters or scores in advanced or counting position, and means operating to lock the remaining counters, and an alarm-signal arranged to be actuated when any one or

more of the counters are moved to counting or scoring position, as and for the purpose set forth.

35. In an apparatus of the class described, a support, a series of counters or scores mounted thereon for movement therealong, one of said counters or scores provided with a projection, an alarm-signal arranged in the path of movement of said counters or scores and adapted to be engaged by said projection, whereby when said counters are moved into counting position said alarm-signal is actuated, as and for the purpose set forth.

36. In an apparatus of the class described, a support, a series of counters or scores mounted thereon, all of equal value, means for moving said counters or scores into counting or scoring position, and a registering mechanism arranged to be actuated by the movement of each of said counters or scores into counting or scoring position, as and for the purpose set forth.

37. In an apparatus of the class described, a support, a series of counters or scores mounted thereon for movement therealong, a projection carried by each of said counters or scores, a registering mechanism arranged to be engaged and actuated by the projection on each of said counters or scores as they are moved thereon into counting position, and means for preventing actuation of said registering mechanism during the return movement of said counters or scores, as and for the purpose set forth.

38. In an apparatus of the class described, a support, a series of counters or scores mounted thereon for movement therealong, a pivoted part mounted upon each counter or score, a registering mechanism arranged to be engaged by the pawl on each of said counters or scores when moved toward counting or scoring position, said pawls yielding to prevent movement of said registering mechanism when said counters are returned to initial position, as and for the purpose set forth.

39. In an apparatus of the class described, a support, a series of counters or scores mounted thereon for movement therealong, said counters or scores adapted to be moved into counting or scoring position, means for locking said counters or scores in advanced or counting or scoring position, and means for releasing said lock, in combination with a catch-drawer, device for normally holding said drawer in closed position, and means actuated by the release of said lock for releasing said drawer-holding means, as and for the purpose set forth.

40. In an apparatus of the class described, a support, a series of counters or scores mounted thereon and adapted to be moved into counting or scoring position, locking devices for locking said counters or scores in advanced or scoring position, releasing mechanism for said locking devices, in combination with a catch-drawer, means for retaining said drawer in closed position, and means actuated by said releasing mechanism for releasing said retaining mechanism, as and for the purpose set forth.

697,477. FRAMES FOR WORKING SHEET METAL. HENRY F. SHAW, Flintley, and WALTON R. SHAW, London, England. Filed Feb. 28, 1901. Serial No. 57,148. (No model.)

Claim.—1. The combination, in a press, of a standard, a punch, a bar, guide-rollers on said bar, guides on said standard for guiding said

bar, a spring acting on said bar, and a guide arranged in the path of said bar, substantially as, and for the purpose, heretofore described.

2. The combination, in a press, of a punch, a standard, guide-rollers on said standard, a shaft in said standard, a bar on said shaft, a spring acting on said bar, guide-rollers on said bar, corresponding guide-rollers on said standard, a bar on said bar, and a correspondingly-shaped guide arranged in the path of said bar, substantially as described.

3. The combination, in a press, of a standard, a punch, a bar, a recess in the surface of said bar, a movable blade forming one edge of said recess, springs acting outwardly on said blade, a stop for limiting the outward travel of said blade, guide-rollers on said standard and on said bar, a spring acting on said bar, and a guide arranged in the path of said bar, substantially as described.

697,478. COIN-CONTROLLED TOY. WILLIAM C. HARRIS, Chester-on-Edw., near Manchester, England. Filed Feb. 1, 1901. Serial No. 48,992. (No model.)

Claim.—1. In a coin-controlled toy, two toy figures, fixed side by side, each figure having a loose leg and arm and a link connecting each leg and arm, and a stand to which the feet and the top of the leg is connected, so that by the inclining of the figure the arm is caused to move radially upward and toward the other figure, a lever adjacent to each figure, a head on each lever, a link-rod connecting the levers, and coin-controlled mechanism, substantially as and for the purposes herein set forth.

2. In a coin-controlled toy, two plates representing the body parts of two toy figures, stands on which said figure-plates are mounted, and an inclined box or casing within which the stands are fixed, an arm fixed on each of the said figure-plates, a leg with slot connected to each plate, a further end within the box or casing and on which the said loose leg is mounted, a loose arm pivotally connected to each figure-plate, a link pivotally connected to the loose arm and leg of each figure-plate, means for independently moving the plates upon their axes, a lever alongside each figure-plate, a pin on the plate and on which the said lever is mounted, a toy head on the upper end of said lever, and a link or connecting rod common to both figure-plate levers connected to the opposite end, a pair of coin-slides in the said casing and adjacent to the said figure-plate-operating means, spiral-plates pivotally mounted on the sides of the casing, a bar or link connecting each plate, and a rod connecting the said bar to the connecting-link of the levers, substantially as and for the purposes set forth.

3. In a coin-controlled toy, a casing, two toy figures of the kind described pivotally supported within said casing, a set of link-rod chains, a set of spiral-plates with slots upon the sides of each chain, a link or bar connecting the spiral-plates, and means for connecting each link or bar to a link by which parts of the toy figures are connected to each other, as set forth.

4. In a coin-controlled toy, a pair of coin-latch chains, plungers for operating toy figures, a pair of levers, one arm of each lever lying below one of the latch-chains, and the other arm lying adjacent to one of the said plungers, a bar or cross-piece upon each arm, a collar with flange upon each plunger, and a fixed guide or abutment, between which latter and the said collar the cross-piece of the lever-arm assembly lies, as set forth.

697,479. SEED-PLANTER. THOMAS E. HARRINGTON, Newbury, Mo. Filed Dec. 21, 1900. Serial No. 41,799. (No model.)

Claim.—1. In a seed-planter machine, a suitable frame, means carried thereby for forming parallel furrows in the ground and for dropping seed in said furrows, means also carried by said frame for making companion parallel furrows and incidentally filling the first-named furrows with the displaced earth, and means for pressing or packing down the earth thus filled in said first-named furrows, substantially as described.

2. In a seed-planter machine, a suitable frame, cutting-disks journaled therein and adapted to furrow the ground in parallel lines, seed-dropping devices mounted on the frame, above adjacent to the disks to hold back the earth and insure the deposit of the seed at the proper depth in the furrow, drive-wheels mounted on the frame, and following in the wake of the disks, and comprising flanges which open up furrows outward of and parallel with the disks furrows and incidentally fill in the furrows of the latter after the seed is dropped therein, and tread-rollers which pack the earth in the disk-furrows thus filled, substantially as described.

3. In a seed-planter machine, a suitable frame, a secondary frame in front of and pivotally linked to the main frame, means to raise and secure said secondary frame at the desired point of adjustment, furrow-making devices secured to the secondary frame, seed-dropping devices, means to insure the deposit of the seed at the proper depth in the furrows made by said furrow-making devices, means for making companion parallel furrows and incidentally filling the first-named furrows with the displaced earth, and means for pressing or packing down the earth thus filled in said first-named furrows, substantially as described.

4. In a seed-planter machine, a suitable frame, a secondary frame in front of and pivotally linked to the main frame, means to raise and secure said secondary frame at the desired point of adjustment, furrow-making devices secured to the secondary frame, seed-dropping devices, means to insure the deposit of the seed at the proper depth in the furrows made by said furrow-making devices, and wheels for operating the seed-dropping devices and comprising a tread-roller, and an annular cutting-flange of greater diameter than the wheel proper and adapted to make a furrow parallel with the first-named furrows and fill the latter with the displaced earth, the said tread-roller being adapted to press or pack down the earth thus filled in, substantially as described.

697,480. RAILWAY-TIE. ALBERT J. HARRIS, Elmhurst, Ill. Filed June 20, 1901. Serial No. 65,282. (No model.)

Claim.—1. A metallic railway-tie having a broad base, the vertical web portion of the tie being formed with coats of a width substantially equal to the base-flanges of the rails, and clamps extending beneath the rails and engaging the base of the tie, said clamps having bent ends interlocking with the base-flanges of the rails on opposite sides of said web portion of the tie.

2. A metallic railway-tie having a broad base, a narrow vertical web or body portion provided with means to receive the base-flanges of the rails and U-shaped clamps having inwardly-bent upper ends, said clamps extending diagonally beneath the tie and rails, the bent upper ends of the clamps overlapping the base-flanges of the rails.

697,481. GAS-BURNER. JOHN HARRIS, Cleveland, Ohio, assignor to Samuel Holmes Smart, trustee, Wiloughby, Ohio. Filed Aug. 19, 1901. Serial No. 72,500. (No model.)

Claim.—1. A gas-burner having the following: an upright tube 12; a mixing-chamber 26 formed within the tube and having its upper end gradually reduced upwardly; a head 36 provided at the upper end of the tube and having an upwardly-discharging port 37 whose lower portion is enlarged downwardly; an upwardly-bulging screen 34 arranged between the lower end of the said port 37 and the upper reduced end of the mixing-chamber, and means for supplying air and gas to the mixing-chamber.

2. A gas-burner having the following: an upright tube 12; a mixing-chamber 26 formed within the tube; a bushing 35 removably secured within the upper portion of the tube and having the inner wall thereof flaring downwardly, with the upwardly-reduced space within the said bushing forming the upper portion of the mixing-chamber; a screen 34 resting upon the upper end of the said bushing; a head 36 provided at and removably secured within the upper end of the tube and arranged to hold the screen against the aforementioned bushing, which head has an upwardly-discharging port 37 whose lower portion flares downwardly toward the screen, and means for supplying air and gas to the mixing-chamber.

3. A gas-burner having the following: a vertically-arranged tube 12, a chamber 17 formed within the lower portion of the said tube, a mixing-chamber 26 formed within the tube above the first-named chamber; a head 36 provided at the upper end of the tube and having a centrally-located upwardly-discharging port 37 whose lower portion is enlarged downwardly; an upwardly-bulging concave-convex screen 34 held in place within the tube at the lower end of the said head; an upright part 27 formed in and centrally of the wall located between the said chamber 17 and the mixing-chamber 26 with its lower end flaring downwardly and with its upper end flaring upwardly, and means for supplying air and gas to the lower chamber 17.

4. A gas-burner having the following: an upright tube 12; a chamber 17 formed within the lower portion of the said tube; lateral apertures or inlets 18 formed in the surrounding wall of the said chamber; a sleeve 19 rotatably embracing the lower portion of the tube 12 and having lateral apertures or holes 20 arranged to register with the said lateral inlets 18; a mixing-chamber 26 formed in the upper portion of the tube 12; an upright part 27 formed in and centrally of the wall located between the said chamber 17 and the mixing-chamber 26 and having a downwardly-flaring lower end and flaring upwardly at its upper end; a head 36 provided at the upper end of the tube 12 and having a centrally-located upwardly-discharging port 37 whose lower portion is enlarged downwardly and whose upper end has a slight internal annular flange having a downwardly-flaring under side, and means for discharging gas upwardly into and centrally of the said lower chamber 17 opposite the air-inlets 18.

5. A gas-burner having the following: an upright tube; a mixing-chamber 26 formed within the tube and having its upper end gradually reduced upwardly; a head 36 provided at the upper end of the tube and having an upwardly-discharging port whose lower portion is enlarged downwardly; means for supplying air and gas to the lower end of the mixing-chamber, and a screen arranged between the lower end of the said head 36 and the upper extremity of the gradually-reduced upper end of the mixing-chamber and vent adjacent to the said extremity.

697,482. ELECTRIC-ARC LAMP. CHARLES E. HARTMAN, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed Oct. 22, 1900. Serial No. 24,682. (No model.)

Claim.—1. In an electric-arc lamp, the combination of a fixed carbon-holder, a movable carbon-holder, a magnet located below the movable holder, an armature clamped below and movable toward or away from the magnet, a rod extending from the armature to the holder and forming the sole retaining means, guides for the rod, and guides for the carbon-holder.

2. In an arc-lamp, the combination of a box-like support, a reflector, an extension on the support to which the reflector is secured, a pair of retentive magnets, movable covers therefor, a yoke connecting the covers, a carbon-holder, a guide for the holder, and a rod which is secured to the yoke and the holder so that as the covers are removed, the position of the cover within the retentive magnet varies for a given length of arc.

3. In an electric-arc lamp, the combination of a base, a pair of solenoids mounted thereon, a head or plate connecting the solenoids at the top and acting also as a guide, an armature for the solenoids, a carbon-holder, a rod connecting the armature and said holder which passes through the head and is guided thereby, and a pair of guides on which the holder travels.

4. In an electric-arc lamp, the combination of a box-like base, a pair of solenoids secured to the outside of the box, a core for each solenoid, a yoke for connecting the cores which is located within the box, a head or plate connecting the magnets, a dash-pot, one portion of which is secured to the plate and the other portion to the yoke within the box.

5. In an electric-arc lamp, the combination of a combined globe and carbon holder, a clamp for holding the globe, means for securing the carbon, a support for the holder comprising a plate having a slotted opening and extending core, and a clamping-cover for drawing the core together in a manner to secure the holder.

6. In an electric-arc lamp, the combination of a base, an actuating-magnet, a core threaded into the outside of the base, a core for each solenoid, a yoke for connecting the cores which is located within the base, a head or plate connecting the magnets, a dash-pot, one portion of which is secured to the plate and the other portion to the yoke within the box.

7. In an electric-arc lamp, the combination of a fixed carbon-holder, a movable carbon-holder, a base, a pair of magnets mounted on the base, a plate connecting the magnets at their upper ends, a core for the magnets, a rod clamped between the magnets for connecting the core with the movable carbon-holder, which rod passes through the plate and is guided thereby, and a pair of vertically-extending rods which pass through the plate to the upper-carbon holder and act as guides thereby.

697,488. STUD-HOLDER FOR CHECK-BOOKS. WILLIAM E. HAVEN, Springfield, Mass. Filed July 22, 1901. Serial No. 69,461. (No model.)

Claim.—A stud-holder constructed from spring-wire comprising an open frame having a stud-engaging border, borders extending laterally from the stud-engaging border, frame-terminals opposite the stud-engaging border extending in parallelism inwardly the ends of the frame-terminals being bent, parts of the frame connecting the borders extending laterally from the stud-engaging border with the frame-terminals, means securing the frame to a book-cover consisting of a paper or like board

having transverse surface grooves to receive the frame-terminals, said board being cemented to the book-cover, thereby firmly uniting said frame and cover, substantially as described.

697,484. EVAPORATING-PAN. JAMES E. HILL and JOHN RIVETT, Worcester, Mass., assignors to Abbot Augustus Low, Brooklyn, N. Y. Filed Sept. 20, 1901. Serial No. 75,795. (No model.)

Claim.—1. The combination with a hollow rectangular base having flanges upon its upper side, of the rectangular evaporating-pan removably supported on the base and held within said flanges, means for supplying steam to the interior of the said base, coils in said pan, a connection between said coils and the interior of the base, and a return-pipe connecting said base with a trap, substantially as described.

2. The combination with a rectangular hollow base having flanges on its upper face, of a rectangular evaporating-pan removably supported thereon and held within said flanges, alternately-disposed partitions in said pan, a coil in the pan divided into sections by said partitions, means for supplying steam to the interior of said base, a connection between said coil and the base, a trap, and a return-pipe connecting the base and trap, as set forth.

3. The combination of a plurality of open evaporating-pans arranged upon different horizontal planes, separable hollow bases therefor forming steam-jackets, an independent coil in each pan, an outlet from the one pan to the next, a steam-supply pipe, a connection from the same to each of the coils, a connection from each coil to the steam-jacket of said pan, a connection from each steam-jacket to the said steam-supply pipe, a trap, a connection from each jacket to said trap, and means connected to said trap for utilizing the heat thereof, as set forth.

697,485. CONDUIT. WILLIAM HOUTON, Norfolk, Wash. Filed Nov. 12, 1901. Serial No. 80,082. (No model.)

Claim.—1. A conduit made trough-shaped and formed with inclined sides and bottom, substantially as described.

2. The conduit, having inclined bottom 4, inclined sides 5, and distance-pieces 6, substantially as described.

697,486. ATTACHMENT FOR BRIDLES. JAMES A. BULL, Chicago, Ill., assignor of one-half to George W. Hall, South Bend, Ind. Filed May 1, 1901. Serial No. 53,246. (No model.)

Claim.—1. The combination with a bridle, of sheet-metal casings applied to the cheek-straps thereof, said casings comprising longitudinal edges spaced apart and provided with lugs arranged in staggered relation and adapted to penetrate the cheek-straps upon opposite sides of the median line thereof to secure the casing to the cheek-straps, extendible connections contained within the casings and a bit supported by said connections, substantially as described.

2. In an extensible connection for bridge-bits, a casing made from a sheet-metal blank having flange upon its side edge, grooves formed in the ends of the blank, and adapted to receive and plates when the blank is bent, a spring within the casing, a connecting-rod engaged at one end by the spring, and playing in the casing, and the other end formed with a hook by means of which the bit is attached, combined with the side strap D to which the extensible connection is secured, substantially as set forth.

697,487. MULTICOLOR-PRINTING MACHINE. GEORGE W. JAMES and ELI G. FRANKLIN, Manchester, England. Filed June 18, 1900. Serial No. 20,057. (No model.)

Claim.—1. In a multicolor-printing machine, the combination of an ink-cylinder as *j*, with adjacent shafts carrying rings as *r*, adjustable on the shafts and segments as *a*, circumferentially adjustable on the rings, substantially as described.

2. In a multicolor-printing machine, the combination of an ink-cylinder as *j* with superposed shafts as *g*, *g'*, grouped around said roll, the said shafts carrying rings as *r*, adjustable on the shafts with segments as *a*, circumferentially adjustable on the rings, substantially as described.

3. In a multicolor-printing machine, the combination of an ink-cylinder, form and a form-taking roll as *j*, with adjacent shafts carrying rings as *r*, adjustable on the shafts with segments as *a*, circumferentially adjustable on the rings, substantially as described.

4. In a multicolor-printing machine, the combination of an ink-cylinder, form and a form-taking roll as *j*, with superposed shafts *g*, *g'* grouped around said roll, the said shafts carrying rings as *r*, adjustable on the shafts with segments as *a*, circumferentially adjustable on the rings, substantially as described.

5. In a multicolor-printing machine, the combination of a form-taking roll as *j* with shafts as *g*, *g'*, grouped around said roll, the said shafts carrying rings as *r*, adjustable on said shafts with segments as *a*, circumferentially adjustable on the rings, an ink-dot, distributor and distributing-roller being combined with each ring-shaft, all substantially as described.

6. In a multicolor-printing machine, the combination of a form-taking roll with wored ink-distributing rings free to turn independently of said roll to distribute lines of ink evenly thereon, substantially as described.

7. In a multicolor-printing machine, the combination of a form-taking roll as *j* with wored ink-distributing rings *p* to distribute lines of ink evenly on the printing-cylinder and shafts having rings as *r*, adjustable on the shafts and segments as *a*, circumferentially adjustable on the rings, substantially as described.

8. In a multicolor-printing machine, the combination of an ink-cylinder, form and form-taking roll with wored rings as *p* free to turn independently of said ink-cylinder, and distributor-pattern-blades provided with a design, arranged around said ink-cylinder and geared to revolve at equal speeds, substantially as described.

697,488. STAIR-CARPET FASTENER. JOHN S. JARVIS, Philadelphia, Pa., assignor to Charles L. E. Jordan, Philadelphia, Pa. Filed July 12, 1901. Serial No. 68,210. (No model.)

Claim.—1. A stair-carpet fastener consisting of members fitted to each other telescopically, and a toggle having one link pivotally connected with one member and the other link pivotally connected with the opposite member.

2. A stair-carpet fastener consisting of members fitted to each other telescopically, and a toggle having one link pivotally connected with one member and the other link pivotally connected with the opposite member, one of said members having means for adjustably connecting the link of the toggle therewith relatively to a desired length of the fastener.

3. A stair-carpet fastener consisting of members fitted to each other telescopically, one of said members having a series of vertically-extending openings therein, a toggle having one link connected with one member and the other link provided with a pivot adapted to enter either of said openings.

4. A stair-carpet fastener consisting of members fitted to each other telescopically, one of said members having a series of vertically-extending openings therein, a toggle having one link connected with one member and the other link provided with a pivot adapted to enter either of said openings, one of said links having a handle thereon for opening the toggle.

5. A stair-carpet fastener having a bar, and a spur or prong, the latter being provided with a hook which is held in the end of said bar.

6. A stair-carpet fastener, consisting of members fitted to each other telescopically, upon the ends of said members, and a toggle-lever, one link of which is pivotally connected with one member and the other is pivotally connected with the opposite member, one of said links being extended beyond its connection with the other link, forming a handle for the toggle.

697,489. MACHINE FOR PRODUCING BOTTLE-CHALING CAPS. ALBERT JONES, Baltimore, Md., assignor to Louis Kelling, Baltimore, Md. Filed May 21, 1900. Serial No. 68,114. (No model.)

Claim.—1. In a machine for producing sealing-caps for bottles, mechanism for forming from a sheet-metal blank an unshaped cap, combined with device to feed into the said unshaped cap, the end of a flexible sleeve, and to cut off the introduced portion so as to leave in the said cap a joint-forming gasket, and other mechanism to turn in the edge of the cap upon the introduced gasket, substantially as specified.

2. In a machine for producing sealing-caps for bottles, mechanism to form from a sheet-metal blank an unshaped cap, device to feed a flexible sleeve along a manifold and into the said cap, and to cut off the introduced portion so as to provide the cap with a joint-forming gasket, and mechanism to turn in the edge of the cap upon the introduced gasket, substantially as specified.

3. As means to feed into a sealing-cap, the lower end of a flexible sleeve, a manifold upon which the said sleeve is placed, and device substantially as described, to clamp the said sleeve and feed it down independently of the manifold, substantially as specified.

4. As means to feed the lower end of a flexible sleeve into a sealing-cap and cut off the introduced portion to form in the cap a joint-forming gasket, the combination of a rotatable manifold upon which the sleeve is placed, a vertically-sliding block at the lower end of the manifold, portion of which block comes to the circumference of the manifold, downwardly-moving levers arranged to clamp the flexible sleeve against the exposed portion of the sliding block, mechanism to push down the clamp-

ing-levers and through them and the sliding block, the clamped sleeve from the cap, and leads mechanism to cut off the inserted portion of the said sleeve, substantially as specified.

5. In a machine for producing sealing-caps for bottles, mechanism for forming from a sheet-metal blank a cup-shaped device, combined with mechanism to feed into the said cup-shaped device, the end of a flexible sleeve, and mechanism to cut off the introduced portion of the said sleeve and thereby provide the said cup-shaped device with a joint-forming gasket, substantially as specified.

697,490. CULTIVATOR. GEORGE C. JONES, Montgomery, Pa. Filed Oct. 17, 1901. Serial No. 70,000. (No model.)

Claim.—1. In a cultivator or the like, means for throwing the dirt, a vertically-movable flapper supported at the side of said means and in operative relation thereto, a spring adjustably supporting said flapper with relation to said means for throwing the dirt and tending at all times to hold said flapper in an elevated position, and a foot-rod by means of which the flapper may be depressed against the action of the spring; substantially as described.

2. In a cultivator or the like, means for throwing the dirt, a flapper vertically movable at the side of said means and in operative relation thereto, and a spring connected to said flapper and a relatively fixed portion of the cultivator and adjustably supporting said flapper with relation to said means for throwing the dirt, whereby said flapper is yieldingly supported in an elevated position; substantially as described.

3. In a cultivator or the like, means for throwing the dirt, a flapper vertically movable at the side of said means and in operative relation thereto, and a connector between said flapper and a relatively fixed portion of the cultivator and adjustably supporting said flapper with relation to said means for throwing the dirt, said connector including a spring attached to the flapper and a chain adjustably connected to said fixed portion of the cultivator; substantially as described.

4. In a cultivator or the like, a frame including an arch, disk gangs supported upon said arch, transversely-extending levers between the supports for said gangs and a suitable portion of said frame, suitably-spaced flapper-plates between said gangs, flaps pivoted to said plates and pivotally supported by said levers, strips upon said flapper-plates and having inwardly-extending portions with crank-ends, a plate having an opening therethrough between said crank-ends, a coacting member extending through said opening and the said plate, a spring coacting to said plate, and a chain coacting to said crank-ends and the said plate, a spring coacting to said plate.

a chain coacting to said spring, a member upon the said arch to which said chain is adjustably connected, and a nut upon the frame and so related to said flapper-plates that said plates can be depressed by the foot of a person seated upon said nut; substantially as described.

697,491. BOTTLE-CHALING DEVICE. LOUIS KALLER, Baltimore, Md. Filed June 18, 1901. Serial No. 68,040. (No model.)

Claim.—A sealing-cap adapted for application to a bottle-head, which consists of a crown, and a compressible cylindrical annular wall depending therefrom, the said wall having its edge provided with an internal bead of an external diameter corresponding with that of the cylindrical wall, combined with an annular compressible joint-forming gasket situated within the annular wall and above and to contact with the internal bead, and which annular gasket, as the said annular wall is reduced in diameter, in the cap-offing operation, is compressed so as to form a joint between the said wall and the bottle-head, substantially as, and for the purpose specified.

697,492. ELECTRO-MAGNETIC WATER-METER. WILLIAM E. KELLY and ALBERT THOMAS, New York, N. Y. Filed Mar. 14, 1901. Serial No. 51,513. (No model.)

Claim.—In combination, a water-supply pipe provided with an enlarged portion or casing, cross-bars mounted therein at the ends of the enlarged portion or casing, said cross-bars being mounted in said enlarged portion or casing, said cross-bars being mounted in the cross-bars, a series of curved grooves upon the surface of the cylinder, conical ends to said cylinder, a vortical carried by the cylinder, and electrical connections adapted to be operated every revolution of the cylinder to measure the flow of water through the pipe.

697,493. VENTILATOR FOR LOCOMOTIVE-ENGINEER. HARRIS KRAMER, Reading, Pa. Filed Nov. 24, 1901. Serial No. 68,998. (No model.)

Claim.—1. The combination with the fire-box of a locomotive, of a sub-throat having its roof extended rearwardly beyond the fire-box and

provided with an air-inlet opening adjacent to the end of the fire-box, and an air-outlet comprising an adjustable air-scooping portion secured to the extended roof above said opening and a deflecting portion below said opening substantially as set forth.

3. The combination with the fire-box of a locomotive of a cab thereon having its roof extended rearwardly beyond the fire-box, of air-outlets comprising adjustable air-scooping portions located at opposite sides of said cab substantially as and for the purpose set forth.

4. The combination with the fire-box of a locomotive, of a cab thereon having its roof extended rearwardly beyond the fire-box and provided with an air-inlet opening adjacent to the end of the fire-box, an air-outlet comprising an adjustable air-scooping portion secured to the extended roof above said opening and a deflecting portion below said opening, and lateral air-deflector plates arranged to cooperate with said roof-outlet to produce converging air-currents to rearward of the fire-box substantially as and for the purpose set forth.

697,494. SPRING ROCKING-CHAIR. CHARLES W. KING and WILLIAM H. KING, Kansas City, Mo. Filed May 13, 1901. Serial No. 69,919. (No model.)

Claim.—1. A rocking-chair, comprising the rockers, having their rear ends overturned forwardly and terminating between the body portions of the rockers and the seat, metallic strips depending from the seat and terminating below the overturned ends of the rockers, and links pivotally connecting the overturned ends of the latter with the contiguous ends of the depending strips, substantially as described.

2. A rocking-chair, comprising the rockers composed of resilient metal and having their rear ends overturned forwardly, and strips secured to the seat and formed with depending U-shaped portions, and links connecting said portions with said overturned ends of the rockers, substantially as described.

3. A rocking-chair, comprising the rockers having their rear ends overturned forwardly, strips secured to the seat and terminating at their front ends in legs united to the front ends of the rockers, and at their rear ends in depending U-shaped resilient portions, and links pivotally connecting said portions with said overturned ends of the rockers, substantially as described.

4. A rocking-chair having its back movable with relation to the seat, and springs 14, above and secured to the latter near its front corners and having their rear ends swiveled to and supporting the back, substantially as described.

5. A chair, comprising springs secured to the seat, a back supported upon the rear ends of said springs and swiveled thereto, and means for detachably connecting the lower end of the back to the seat as to relatively fix the relation of said springs, substantially as described.

6. A rocking-chair, comprising springs secured to the seat, a back supported upon the rear ends of said springs and swiveled thereto, and a back and loop connection between the lower end of the back and the rear edge of the seat substantially as described.

7. A rocking-chair, comprising springs secured to the seat, a back supported at the rear ends of said springs, and a spring secured at its opposite ends to the seat and the lower end of the back, and means to resist downward or rearward movement of the latter, substantially as described.

697,495. BOOK-GRINDER HAVING WIRE AND HARDENED LEAVES. ARTHUR R. KITTENDGE and ROBERT E. KITTENDGE, Trinity N. J., assignors to the Acoustal, Acoustal & Acoustal Company, Limited New York, N. Y., a Corporation of New Jersey. Filed Aug. 10, 1900. Serial No. 27,717. (No model.)

Claim.—1. A book having wide and narrow leaves with an integral flap upon the margin of each of the wide leaves folded uniformly backward to thicken the edge and to produce a level and unobstructed writing-surface upon all of the said leaves upon the same side thereof.

2. A sheet folded to form two leaves of equal width and having the margin of each leaf folded over to form an integral flap, and the longitudinal edge of each flap being secured to the face of the leaf to form a longitudinal pocket having openings at the ends only.

3. A sheet having marginal flaps upon two opposite edges folded over in reverse directions and secured to the opposite faces of the sheet, whereby when the sheet is folded between said margins to form two leaves, the marginal flaps are on the same side of each leaf.

4. A bound book consisting of sections each consisting of the group of an integral pair of wide leaves with their margins thickened, with a series of integral pairs of narrow leaves inserted in the fold of each wide leaf, and a similar series of pairs of narrow leaves adjacent to the side of each group, whereby the thickness upon each of the wide leaves compensates for the narrow leaves at one side of each wide leaf.

697,496. SHIPPING VESSEL FOR ICE-CREAM. FREDERICK C. ELSON, Louisville, Ky. Filed Jan. 27, 1902. Serial No. 91,308. (No model.)

Claim.—1. In a vessel for shipping ice-cream, the combination of a pasteboard cream tub or box, a pall or receiver therefor which is composed of strawboard or the like, waterproofed on its interior and having a corrugated sheet outside and a covering over the same connected to the pall, and a drainage-tube passing through the outer casing, corrugated packing, and waterproofed side of the pall.

2. In a vessel for shipping ice-cream, the combination of the inner ice-receptacle of sheet material waterproofed on its inner surface, the outer covering and the interposed corrugated packing, and a drainage-tube passing through the side of the ice-receptacle and its covering, said covering being waterproofed on its outer surface near the terminal of the drainage-tube, substantially as described.

3. The combination, in an ice-cream storage vessel, of the cream-tub, a pasteboard pall having a wooden bottom and waterproofed on its inner face only, an outer tubular covering of pasteboard and an interposed corrugated sheet, and wire hoops confining the pasteboard tub to position, substantially as described.

4. In an ice-cream shipping and storing vessel, a pall composed of a tube of pasteboard, a wooden bottom, and a covering around the tubular portion consisting of a corrugated non-conducting lining, and a paper covering, cover-detents connected to this tubular covering, and a flat cover having clips which may be passed through said detents.

5. In an ice-cream-storing vessel, a receiver having its sides of strawboard or the like waterproofed on its inner surface only, a corrugated sheet surrounding said sides, a paper covering therefor waterproofed on a part only of its outer surface, and a drainage-tube passing through the waterproofed portion of the outer cover and into the receiver, all combined.

697,497. SAWING-MACHINE. CHARLES C. KRAFT, Buffalo, Cal. Filed June 20, 1901. Serial No. 68,890. (No model.)

Claim.—1. In a sawing-machine attachment, the combination with the vertically-arranged feed-rolls, of the means arranged upon the carriage for operating the said feed-rolls upon the reciprocation of said carriage,

together with means for moving one of the rolls out of engagement with the remainder of the block and simultaneously operating a disengaging-plate for disengaging the block from the other feed-roll, substantially as described.

2. In a sawing-machine attachment, the combination with the feed-rolls, of the brackets and arms carrying the said feed-rolls, one of said arms being pivoted and normally held in position by means of a spring, the ratchet, pawl, lever and connecting-rod, the plunger and rocking lever, the disengaging-plate, the rod to which said disengaging-plate is attached, the rocker-arm connected to the pivoted feed-roll arm by means of a link, and the vertically-movable rod adapted to be projected into the path of the free end of the pivoted arm for the purpose of simultaneously disengaging the said feed-roll and operating the disengaging-plate, substantially as and for the purpose described.

697,498. MACHINE FOR FORMING PLASTIC PATTERNS ON WALL-PAPER. EDWARD KRAUS, New York, N. Y., assignor of one-half to CHARLES KRAUS, New York, N. Y. Filed Feb. 4, 1902. Serial No. 92,799. (No model.)

Claim.—1. In a machine for forming plastic patterns on wall-paper, the combination of a mold-box with a pattern-plate, a plunger, and means for raising the pattern-plate, substantially as specified.

2. In a machine for forming plastic patterns on wall-paper, the combination of a mold-box with a pattern-plate, a plunger, and means for raising the mold-box and pattern-plate, substantially as specified.

3. In a machine for forming plastic patterns on wall-paper, the combination of a paper-clamp with a mold-box, a pattern-plate secured there-

to, a plunger within the mold-box, and means for raising the clamp and mold-box, substantially as specified.

4. In a machine for forming plastic patterns on wall-paper, the combination of a mold-box with a pattern-plate, means for raising the pattern-plate, and a knife adapted to be projected into the mold-box, substantially as specified.

5. In a machine for forming plastic patterns on wall-paper, the combination of a mold-box with a pattern-plate secured thereto, a knife adapted to be projected into the mold-box, a paper-clamp, and means for raising said clamp and the pattern-plate, substantially as specified.

6. In a machine for forming plastic patterns on wall-paper, the combination of a hinged mold-box having a pin, with a hinged paper-clamp having a hook adapted to be engaged by said pin, substantially as specified.

7. In a machine for forming plastic patterns on wall-paper, the combination of a cam, with a lever actuated thereby, a screw-bolt, a universal coupling between lever and screw-bolt, a threaded sleeve engaging the screw-bolt, a plunger, and a second universal joint between the threaded sleeve and plunger, substantially as specified.

8. In a machine for forming plastic patterns on wall-paper, the combination of a hinged mold-box with a pattern-plate secured thereto, means for tilting the mold-box, a knife adapted to be projected into the mold-box, a lever for actuating said knife, and means for disengaging the knife from said lever, substantially as specified.

9. In a machine for forming plastic patterns on wall-paper, the combination of a hinged mold-box, with steps projecting into the upper part of the case, and a plunger which is adapted to engage said steps and tilt the mold-box, substantially as specified.

697,499. BOOK-BINDER. CHARLES W. KROEMER, Chicago, Ill. Filed Sept. 20, 1901. Serial No. 70,861. (No model.)

Claim.—1. The herein-described book-binder comprising the body portion 1 provided at its upper end with a plurality of book-markers as 2, 3 and 4, in combination with a guiding-rod 11 disposed at right angles to said markers; a member movably secured upon said guiding-rod; supporting-legs; a finger pivotally attached to said guide and designed to designate any part of the page of the book and a loop member 24 movably secured in guiding-brackets carried by said body portion and operatively connected to the supporting-legs whereby the latter may be tilted parallel with said body portion when not required for use, all combined substantially as specified and for the purpose set forth.

2. The combination of a body portion, pivotally-mounted book-markers, a guiding-rod at one side of the body portion, an underbar member loosely mounted upon said guiding-rod, a finger pivotally secured to said underbar member, loop members, legs pivotally connected to said loop members and guides for the said loop members, all substantially as shown and described.

697,500. MACHINE FOR GRINDING HEARINGS. HENRY LA GARE, Auburn, N. Y. Filed Jan. 2, 1901. Serial No. 68,890. (No model.)

Claim.—1. In a machine for simultaneously grinding two surfaces, the combination with a work-support, of a wheel having two grinding-surfaces disposed at equal angles to the axis of rotation of said wheel, said wheel rotating in a plane angularly disposed relative to the plane of the work.

2. In a machine for simultaneously grinding two surfaces, the combination with a rotating work-support, of a wheel having two grinding-surfaces disposed at equal angles to the axis of rotation of said wheel, and

wheel rotating in a plane angularly disposed relative to the plane of rotation of the work.

3. In a machine for simultaneously grinding a plurality of surfaces, the combination of a wheel having a plurality of grinding-surfaces disposed at different planes to the axis of rotation of said wheel, said wheel rotating in a plane angularly disposed relative to the plane of the work, and adjusting means for varying the angle of the grinding-surfaces.

4. In a machine for simultaneously grinding two surfaces, the combination with a rotating work-support, of a wheel having two grinding-surfaces oppositely inclined relative to the axis of rotation of said wheel, said wheel rotating in a plane angularly disposed relative to the plane of rotation of the work, the angle of inclination of said grinding-surfaces to the axis of the wheel being equal.

5. In a machine for grinding two surfaces simultaneously, the combination with a rotating work-support, of a cup-shaped wheel rotating in a plane inclined relative to the plane of rotation of the work, said wheel having its rim provided with two inclined grinding-surfaces.

6. In a machine for grinding two surfaces simultaneously, the combination with a rotating work-support, of a cup-shaped wheel rotating in a plane inclined relative to the plane of rotation of the work, said wheel having its rim provided with two continuous inclined grinding-surfaces.

7. In a machine for grinding two surfaces simultaneously, the combination with a rotating work-support, of a cup-shaped wheel having its rim provided with two continuous oppositely-inclined grinding-surfaces, said grinding-surfaces being inclined at equal angles to the axis of rotation of said wheel.

8. In a machine for grinding bearings, the combination with a work-support, of a grinding-wheel having oppositely-inclined grinding-surfaces to dress the bearing simultaneously at two points and means for adjusting said grinding-wheel angularly relative to the work.

9. In a machine for grinding bearings, the combination with a work-support, of a grinding-wheel having oppositely-inclined grinding-surfaces to dress the bearing simultaneously at two points, means for adjusting said grinding-wheel angularly relative to the work, and means for adjusting said grinding-wheel longitudinally of the machine to compensate for wear.

10. In a machine for grinding ball-bearings, the combination with a suitable supporting-frame, of a grinding-wheel for dressing the outer surface of the bearing mounted on said frame, a table mounted on said supporting-frame, a work-support carried by said table, a grinding-wheel for dressing the inner surface of said bearing mounted on said table, and means for feeding said table and the instrumentalities mounted thereon past the first-named grinding-wheel.

11. In a machine for grinding bearings, the combination with a stationary grinding-wheel support, of a work-support, means for moving said work-support and work toward said grinding-wheel, and a second grinding-wheel in operative relation to said work-support and movable therewith.

12. In a machine for grinding bearings, the combination with a stationary adjustable grinding-wheel support, of an adjustable work-support, automatic means for moving said work-support and work toward said grinding-wheel, a second grinding-wheel in operative relation to said work-support, and means for adjusting said second grinding-wheel angularly relative to the work.

13. In a machine for grinding the outer and inner surfaces of bearings, the combination with a stationary adjustable grinding-wheel support, of a grinding-wheel for dressing the outer surface of the bearing mounted thereon, a table movable relative to said grinding-wheel, a work-support adjustably mounted on said table, and a second grinding-wheel to dress the inner surface of the bearing adjustably mounted on said table.

14. In a machine for grinding the outer and inner surfaces of bearings, the combination with a stationary adjustable grinding-wheel support, of a grinding-wheel for dressing the outer surface of the bearing mounted thereon, a table movable relative to said grinding-wheel, a work-support

adjustably mounted on said table, a second grinding-wheel to dress the inner surface of the bearing adjustably mounted on said table, said grinding-wheel having two grinding-surfaces to act simultaneously on two bearing-surfaces, and automatic means for feeding said table and the instrumentalities carried thereby past the first-named grinding-wheel.

15. In a machine for grinding two surfaces simultaneously, the combination with a suitable work-support, of a cup-shaped grinding-wheel having a rim substantially V-shaped in cross-section.

16. In a machine for grinding two surfaces simultaneously, the combination with a suitable work-support, of a cup-shaped grinding-wheel having a rim substantially V-shaped in cross-section, the axis of said rim being inclined at equal angles to the longitudinal axis of the wheel.

17. In a machine for simultaneously grinding two surfaces, the combination with a work-support of grinding-wheels mounted in angular relation to said work, and means for adjusting said wheels to vary the angle thereof relative to the work.

18. In a machine for simultaneously grinding three surfaces angularly disposed relative to one another, the combination with a work-support, of a grinding-wheel adapted to dress two of said surfaces at the same time, a second grinding-wheel to simultaneously dress the third surface, and means for giving an angular adjustment to said grinding-wheels relative to the work, and means for moving the work past said second grinding-wheel.

19. In a machine for simultaneously grinding three surfaces angularly disposed relative to one another, the combination with a rotating work-support, of a grinding-wheel adapted to dress two of said surfaces at the same time, a second grinding-wheel to simultaneously dress the third surface, means for giving an angular adjustment to said grinding-wheels relative to the work, and means for moving the work past said second grinding-wheel.

20. In a machine for grinding bearings, the combination of a work-holding support, pivoted to swing horizontally, so as to change the angle of application of a grinding-wheel, as G, thereon, the grinding-wheel, G, and another grinding-wheel, as H, having two grinding-surfaces equally disposed to its axis of rotation, and mounted so as to admit of angular adjustment in the horizontal plane, to the work whereby three points may be ground at once, at chosen angles in relation to each other, substantially as described.

697,501. GATE-OPENER. CHARLES F. LEE, Astoria, Ill., assignor of one-half to William G. Gage, Astoria, Ill. Filed May 20, 1901. Serial No. 61,152. (No model.)

Claim.—1. In a device of the class described, the combination of a support, a horizontally-rotating gate, a vertically-movable operating-bar arranged at right angles to the gate, when the latter is closed and held against lateral and longitudinal movement, a horizontally-rotating bracket mounted on the support and arranged to swing horizontally across the path of the vertically-movable bar and located at one side of the gate when the gate is open and at the opposite side thereof when the gate is closed, operating mechanism connected with the vertically-movable bar, and means for connecting the bracket with the gate and with the vertically-movable bar, said means forming a lock for holding the gate in its open and closed positions, substantially as described.

2. In a device of the class described, the combination of a support, a horizontally-rotating gate, a vertically-movable operating-bar arranged at right angles to the gate, when the latter is closed and held against lateral and longitudinal movement, a horizontally-rotating bracket mounted on the support and arranged to swing horizontally across the path of the vertically-movable bar and located at one side of the gate when the gate is open and at the opposite side thereof when the gate is closed, operating mechanism connected with the vertically-movable bar, and means for connecting the bracket to the gate and to the vertically-movable bar and forming a lock for holding the gate in its open and closed positions, substantially as described.

3. In a device of the class described, a support, a gate disposed to swing horizontally, a bar arranged at right angles to the gate when the

latter is closed and pivotedly supported in one end and movable vertically by the other end, said bar being held against lateral movement, a bracket hinged by one end to said support and free to swing across the path of said bar, means for connecting the movable part of said bar to the free end of said bracket, and means for connecting said gate to the free end of said bracket, substantially as described.

4. In a device of the class described, the combination of a support, a horizontally-rotating gate, a vertically-movable bar arranged at right angles to the gate when the latter is closed and pivoted at one end and held against lateral movement, a bracket mounted on the support and arranged to swing across the path of the vertically-movable bar to points at opposite sides of the gate, links connecting the bracket with the gate and with the bar and forming a lock for holding the gate in its open and closed positions, and means for operating the bar, substantially as described.

5. In a device of the class described, a vertical support, a bracket hinged by one end to said support, a gate disposed to swing horizontally, a rod disposed upon said gate and with downwardly-turned ends, a link-bar connected to one of said downwardly-turned ends, a vertically-movable bar, means for connecting the free end of said bracket with said bar, and means for connecting the free end of said bracket with the other downwardly-turned end of said rod, substantially as described.

6. In a device of the class described, the combination of a vertical support, a gate hinged to said support, a bracket hinged at one end to the support, a vertically-movable bar having its free end located directly above the hinged end of the bracket, a connecting-rod pivotedly united at its ends to the free end of the bracket and to the said bar, a rod pivotedly united at its ends to the free end of the bracket and to the gate, and means for elevating said bar, substantially as described.

7. In a device of the class described, a support, a gate disposed to swing horizontally, a bracket hinged by one end to said support, a vertical guide upon said support, a bar hinged by one end and engaging said guide by the other end, means for connecting the free end of said bracket with said gate, and means for connecting the free end of said bracket with the movable part of said bar, substantially as described.

8. In a device of the class described, a vertical post, a gate hinged to said post, a bracket hinged by one end to said post, a second post vertically disposed in alignment with said gate-post, a bar hinged by one end to said second post, and free to move vertically by the other end above said bracket, means for connecting the free end of said bracket to said gate, and means for connecting the free end of said bracket with the movable part of said bar, substantially as described.

697,502. REMOVABLE TRAY FOR ELEVATOR-BOOTS. JOHN H. LAMBERT, Des Moines, Iowa. Filed Aug. 1, 1901. Serial No. 79,421. (No model.)

Claim.—1. In combination with an elevator-boot provided with removable gates, of a removable tray which forms the bottom of the lower end of the boot, substantially as and for the purpose specified.

2. In combination with an elevator-boot of a removable tray therefor, said tray having upturned sides and forming the bottom of the lower end of the boot, substantially as and for the purpose specified.

3. In combination with an elevator-boot of a removable tray therefor, said tray having upturned sides and engaging guide slots or grooves in the boot, substantially as and for the purpose specified.

4. In combination with an elevator-boot having removable gates which form the two sides of the lower end of the boot and disposed on an incline, of a removable tray having upturned sides, the lower ends of the gates extending over the tray to hold it in place, substantially as and for the purpose specified.

697,503. PACKAGE. CLARENCE A. LEBLANC, New York, N. Y. Filed Nov. 26, 1901. Serial No. 58,774. (No model.)

Claim.—1. A package of merchandise in which the articles are partially inclosed in an inner wrapper of less width than the length of the articles, and are separately removable through one end of said wrapper.

and an outer inclosing wrapper having a removable end to expose a portion of the sides of the articles for withdrawal from the package.

2. A package of merchandise in which the articles are arranged and held between the folds of an inner wrapper and are separately removable through one end of said wrapper, and an outer inclosing wrapper secured to the inner wrapper and having a removable end to expose the articles for withdrawal from the package.

3. A package of merchandise in which the articles are arranged and held between the folds of an inner wrapper and are separately removable through one end of the wrapper, and an outer inclosing wrapper having perforations adjacent to one end to facilitate the removal thereof and to expose a portion of the articles for withdrawal from the package.

4. A package of merchandise in which the articles are arranged and held upon itself with the articles between the folds and which are separately removable through one end of the wrapper, an outer wrapper having a fold on its side and folded ends, and perforated adjacent to one end, and means for securing the folds of said outer wrapper.

5. A package of merchandise in which the articles are arranged on a wrapper of less width than the length of the articles, held between the folds thereof, and are removable through one end of the wrapper, and means for automatically contracting the package as the articles are removed.

6. A package of merchandise in which the articles are arranged on a wrapper and held between the folds thereof, and elastic bands encircling the package for contracting the package as the articles are removed.

7. A package of merchandise in which on inner rectangular wrapper is rolled upon itself with articles of greater length than the width of the wrapper between the folds, and which articles are removable separately through one end of the wrapper, and an outer inclosing wrapper secured to the inner wrapper and provided with a removable end.

697,504. CARTER. DANIEL R. LEITCHFIELD, Chicago, Ill. Filed Mar. 28, 1901. Serial No. 61,200. (No model.)

Claim.—1. A garter comprising a continuous strip of fabric doubled to so to form an upper and a lower loop, a clasp mounted upon said fabric at the point where said upper and said lower loops meet, and means for attaching said lower loop to a stocking, substantially as described.

2. In a garter, the combination of an upper loop, a lower loop supported thereby, and means mounted upon said loops at the points where they join each other for separately closing said loops, substantially as described.

3. A knee-supporter, comprising a band doubled upon itself to form upper and lower loops, an adjustable friction-clip mounted upon one of the doubled ends of said band, means attached to the doubled ends of said band for separately connecting said ends to each other, and means connected with said lower loop for engaging a stocking, substantially as described.

897,505. ROCK-PULVERIZER. HARRY LOCKERBACH, Seattle, Wash., assignor of one-half to James A. Howell, Seattle, Wash. Filed Dec. 10, 1900. Serial No. 48,431. (No model.)

Claim.—1. In a device of the character described, a central chamber, wing-compartments, oppositely-disposed nozzles discharging the contents of the wing-compartments into the central chamber, each of said wing-compartments having an opening above the nozzle and a pocket beneath the nozzle, and covers for the openings provided with perforations in their upper parts, substantially as described.

2. In a device of the character described, a feed-compartment, a nozzle projecting therefrom, said compartment having an opening above the nozzle and a pocket beneath the nozzle, and a cover for the opening provided with an inclined perforated portion, substantially as described.

897,506. STOVE FOR HEATING, COOKING, AND BAKING. ROBERT C. MACCOLLUM, Des Moines, Iowa. Filed Dec. 14, 1901. Serial No. 98,094. (No model.)

Claim.—1. In a stove having an open top, covers fitted thereon to slide in opening and closing the top and baskets for supporting fuel under the covers at the ends and top of the stove, arranged and combined as set forth for the purpose stated.

2. In a stove having an open top, covers fitted thereon to slide in opening and closing the top and baskets for supporting fuel under the covers at the ends and top of the stove and an oven in the form of a sliding drawer in the bottom and central portion of the stove, arranged and combined as set forth for the purpose stated.

3. A stove for heating, cooking and baking comprising a four-sided wall, sliding covers on top of the wall, rods extended through the top portion of the stove and fixed to the ends of the wall, baskets for fuel fixed in the top and end portions of the stove, an oven in the lower and central portion of the stove, registers in the lower portions of the ends of the wall and a flue at the top of one end of the wall, arranged and combined to operate in the manner set forth for the purpose stated.

897,507. ELECTRICAL CONDENSER. GEORGE F. MAURER, Whitelien, England. Filed Nov. 15, 1900. Serial No. 50,764. (No model.)

Claim.—1. As an article of manufacture an electrical condenser consisting of two strips of paper wound up together in the form of a roll, each of said strips being coated on one side with metal in a finely-divided state.

2. As an article of manufacture an electrical condenser consisting of the combination of two strips of paper each of which is coated on one side with metal in a finely-divided state, with a plurality of strips of uncoated paper interposed between said coated strips.

3. As an article of manufacture, an electrical condenser consisting of two pairs of strips of paper wound up together in the form of a roll, each of said strips being coated on one side with metal in a finely-divided state, and each pair of strips having the metallic sides face to face in contact with one another.

897,508. LOOMSHUTTLE. FAY E. MARSH, Hydeport, Mass., assignor to the American Loom Company, Randolph, Mass., a Corporation of New Jersey. Filed Jan. 14, 1901. Serial No. 42,102. (No model.)

Claim.—1. In a loomshuttle having the threading-chamber in advance of the yarn-carrying cavity thereof, a tilted yarn-passing leading from said cavity to said chamber, the tilted or open delivery eye or

advent, the bottom and grooved collar within said chamber, and the downwardly-extending flange on said bottom formed with the detent to prevent the yarn from being drawn back from around the bottom and collar, substantially as described.

2. A loomshuttle having the longitudinal groove or depression in the top thereof, the threading-chamber, the tilted or open delivery eye or advent, the bottom flanged at its top and having the depending flange formed with the detent, and the collar, said bottom and collar enclosing the said chamber, substantially as described.

3. A loomshuttle having the longitudinal groove or depression in the top thereof, the threading-chamber, the tilted or open delivery eye or advent, the bottom having the depending flange formed with the detent, the said bottom having the flange at the top thereof cut away as described across the said groove or depression, and the collar, said bottom and collar enclosing the said chamber, substantially as described.

4. A loomshuttle having the longitudinal groove or depression in the top thereof, the threading-chamber in advance of the yarn-cavity, the tilted yarn-passing leading from said cavity to said chamber, the tilted or open delivery eye or advent, the bottom having the depending flange formed with the detent, the said bottom having the flange at the top thereof cut away as described across the said groove or depression, and the collar, said bottom and collar enclosing the said chamber, substantially as described.

897,509. MOLD FOR PAPER OR PULP. JOHN F. MARTIN, New York, N. Y. Filed Feb. 14, 1902. Serial No. 94,121. (No model.)

Claim.—1. A mold comprising a bottom provided at intervals with sides or openings arranged to receive eyes or loops and adapted to support the same, whereby the latter are partially embedded in a past, sides connected with the bottom, and end pieces, substantially as described.

2. A mold comprising a bottom, transverse strips, sides connected with the bottom and supporting the transverse strips, and an end piece supported by the transverse strips, substantially as described.

3. A mold comprising a bottom, sides, strips secured to the sides and arranged in pairs to form grooves, and end pieces supported by the grooves, substantially as described.

4. A mold comprising a bottom, sides having grooves, and an end piece hinged to the bottom and detachably interlocked with the grooves, substantially as described.

5. A mold comprising a bottom, longitudinal strips secured to the bottom at opposite sides of the center thereof and spaced from the side edges, sides hinged to the bottom and arranged upon the side portions of the bottom beyond the strips thereof and provided at their upper edges with longitudinal strips, transverse strips mounted on the sides and forming grooves, an end piece detachably interlocked with the grooves, and upper and lower transverse strips or pieces arranged at the top and bottom of the end piece, substantially as described.

6. A mold provided in one of its walls with a longitudinal groove

and having a series of short strips or pieces arranged within the mold and spaced apart to form recesses or openings adapted to receive eyes or loops of a fine-past or pulp, substantially as described.

7. A mold comprising a bottom, sides hinged to the bottom, an end piece also hinged to the bottom, and strips secured to the sides and bottom and supporting the end piece, substantially as described.

897,510. COMBINED CORN-PLANTER AND FERTILIZER-DISTRIBUTOR. HENRY D. MATTHEW, Haledorf, Va. Filed Nov. 31, 1901. Serial No. 93,102. (No model.)

Claim.—1. The combination of a fertilizer-hopper a slide under the same, said slide having a longitudinal fertilizer-opening, a drop-plate forming the bottom of the rear portion of said opening, and a cut-off plate covering the front portion of said opening, a fixed stop disposed in the front portion of said opening, under said cut-off plate, and a sweep element, relatively fixed and operating in the rear portion of said opening, over said drop-plate, and opposite said fixed stop, substantially as described.

2. The combination of a fertilizer-hopper, a slide under the same, said slide having a longitudinal fertilizer-opening, a drop-plate forming the bottom of the rear portion of said opening, and a cut-off plate covering the front portion of said opening, a fixed stop disposed in the front portion of said opening, under said cut-off plate, and a relatively fixed adjustable sweep-gage, disposed in the rear portion of said opening over said drop-plate and opposite said fixed stop, substantially as described.

897,511. MACHINE FOR TREATING TOBACCO-STEMS. RAY C. HAY, Richmond, Va., assignor to W. Gray Mosley, Richmond, Va. Filed May 20, 1901. Serial No. 68,300. (No model.)

Claim.—1. In a machine for treating tobacco-stems, the combination with a device for breaking the stems and leaf attached to the same, and a sleeve for separating and grading the broken stems and leaf, of an endless carrier for carrying the stems and attached particles of leaf to the disintegrating device, a trough through which said carrier travels, and means for directing an air-current through said trough, substantially as described.

2. In a machine for treating tobacco-stems, the combination with a device for breaking the stems and leaf attached to the same, and a sleeve for separating and grading the broken stems and leaf, of a carrier for delivering the stems and attached leaf to the disintegrating device, and means for subjecting the stems and attached leaf to the action of steam before delivering the stems and attached leaf to the disintegrator, substantially as described.

3. In a machine for treating tobacco-stems, the combination with a device for breaking the stems and leaf attached to the same, and a sleeve for separating and grading the broken stems and leaf, of an endless carrier for carrying the stems and attached particles of leaf to the disintegrating device, a trough through which said carrier travels a fan for impelling a current of air through said trough, a compartment for treating a portion of the carrier next to the disintegrating device, and a perforated pipe in said compartment, substantially as described.

4. In a machine for treating tobacco-stems, the combination of a disintegrator for breaking the stems and the leaf attached to the same, a separating sleeve having a grading-surface of different grades, separate

chambers beneath the stove to receive the different grades of tobacco-leaf means for separating leaf from stems, a drying-chamber, and means for delivering the tobacco-stems to said chamber, substantially as described.

5. In a machine for treating tobacco-stems, the combination of a disintegrator for breaking the stems and the leaf attached to the same, a re-disintegrating device having a grading-surface of different meshes, separate chambers to receive the separate grades of leaf, means for separating leaf from stems, and means to receive the stems separate from the leaf, substantially as described.

6. In a machine for treating tobacco-stems, the combination of a disintegrator for breaking the stems and the leaf attached to the same, a re-disintegrating device having a grading-surface of different meshes, separate chambers to receive the separate grades of leaf, means for creating an air-blast for carrying the leaf from particles of the stems, and means for delivering the stems to a drying-chamber, substantially as described.

7. In a machine for treating tobacco-stems, the combination of a disintegrator for breaking the stems and the leaf attached to the same, a re-disintegrating device having a grading-surface of different meshes, a box formed with a hopper to receive the tobacco-leaf and particles of stems from the sieve and having separate compartments for the separate grades of leaf, inclined boards in said hopper to direct the broken leaf and particles of stems toward the separate compartments, air-flow and means for impelling an air-current through the same and against the falling leaf and stems to carry the leaf from the stems, and means for receiving the particles of stems separated from the leaf, substantially as described.

8. In a machine for treating tobacco-stems, the combination of a disintegrator and separator for detaching the leaf from the stems and separating one from the other, a drying-chamber and means for delivering the stems from the separator to the drying-chamber, said drying-chamber containing a platform formed of a number of plates having their adjacent edges overlapping and out of line with each other, an endless carrier for moving the stems over said platform in the direction in which the plates overlap each other, heating-pipes extending along the under side of the overlapping plates, and means permitting the entry of air into one end of said chamber and its exit from the opposite end, substantially as described.

697,513. MACHINE FOR DRYING LEAF-TOBACCO. DAVID C. HAYS, Richmond, Va., assignor to W. Gray Hensley, Richmond, Va. Filed June 13, 1901. Serial No. 63,172. (No model.)

Claim.—1. A machine for drying leaf-tobacco comprising a preliminary steam-spraying room for spraying and opening up the tobacco-leaf, a drying-room in communication with the spraying-room, a cooling-room in communication with the drying-room, an "ordering-room" at the end of the cooling-room, means for carrying leaf-tobacco through the several rooms, a steam-spraying device in the preliminary spraying-room, means for exhausting the moisture-charged air from the spraying-room and dis-

charging it outside of said room without a recirculation of it in the room, means for impelling into the drying-room hot air derived from a source outside of the drying-room, means for exhausting the air from the drying-room at the portion thereof toward the cooling-room, means for impelling cool air through the cooling-room, means for heating the "ordering-room" and creating a vapor mist therein, and means for exhausting air from the "ordering-room," substantially as described.

2. In a machine for drying leaf-tobacco, the combination with a drying-room, of a preliminary spray-room provided with means for creating a steam spray therein for loosening and opening up the tobacco-leaves, means for exhausting the moisture-charged air from the spray-room and discharging it outside of said room without a recirculation of it in the room and means for conveying the leaf-tobacco from said spray-room into the drying-room, substantially as described.

3. In a machine for drying leaf-tobacco, a drying-room, a chamber heated outside of the drying-room and provided with means for heating air therein, an air-impelling device communicating with said heating-chamber and delivering hot air into the drying-room, means for exhausting air from the drying-room at a point toward the discharge end of the drying-room and discharging it from said room without permitting a recirculation through the room whereby an inflowing current of fresh hot air is impelled over the material in the room and the heated air is carried off without again coming in contact with the material, and means for carrying through said room the material to be dried, substantially as described.

4. In a machine for drying leaf-tobacco, the combination with a cooling-room, of an "ordering-room," means for exhausting air from said room, without permitting a recirculation through said room, and means for carrying tobacco-leaf from the cooling-room into and through the "ordering-room," substantially as described.

5. In a machine for drying leaf-tobacco, having a tobacco-leaf carrier, an "ordering-room" provided with spray-pipes heated in the room beneath the leaf-carrier to create beneath the carrier a vapor mist, and means for drawing the mist up through the tobacco-leaf and carrying it out of the room without its recirculation through the tobacco-leaf, substantially as described.

6. In a machine for drying leaf-tobacco, the combination of a series of rooms separated by partitions, a tobacco-leaf carrier passing through the rooms, a door to each partition, beneath the upper part of the leaf-carrier, and a flexible apron above the partition and the upper part of the leaf-carrier, substantially as described.

7. In a machine for drying leaf-tobacco, the combination of a series of rooms in communication one with the other, an endless-chain carrier there-

ing through the rooms, said carrier consisting of two end chains and a central chain, the central chain having flanges extending at intervals from its opposite sides and the end chains each having flanges projecting from their sides toward the central chain, to receive and support leaf-tobacco, supporting means between the central chain and the two end chains, substantially as described.

697,518. ROLL WRAPPER PRINTING DEVICE. FRANK L. HENSON, Columbus, Ohio. Filed Nov. 2, 1901. Serial No. 58,964. (No model.)

Claim.—1. In a printing apparatus, a holder for the articles to be printed, combined with a printing-roller and an inking device therefor, a lock between the roller and its carrying-frame for limiting the rotation of said printing-roller, and a lever arranged to operate said lock to effect the release thereof by the manipulation of the article to be printed.

2. In a printing apparatus, a holder for the articles to be printed, combined with a printing-roller and an inking device therefor, a stop device on said printing-roller, an automatically-movable abutment for said stop, and a lever arranged to release said abutment from the stop device on the roller by the manipulation of the article to be printed.

3. In a printing apparatus, a holder for the articles to be printed, combined with a printing-roller and an inking device therefor, a stop device on said roller, a frame in which said printing-roller and inking device are mounted, a spring-actuated abutment in said frame coacting with the stop device to limit the movement of said roller, and a lever to be actuated by the manipulation of the article to be printed to release said abutment from engagement with said stop device.

4. In a printing apparatus, a holder for the articles to be printed, combined with a printing-roller and an inking device therefor, a stop device on said roller, a frame in which said printing-roller and inking device are mounted, a spring-actuated abutment in said frame coacting with said stop device to limit the movement of said roller a cam edge or surface on said spring, and a lever to be actuated by the manipulation of the article to be printed to release said abutment from engagement with said stop device.

5. In a printing apparatus, a holder for the articles to be printed, combined with a printing-roller and an inking device therefor, a stop device on said roller, a frame in which said printing-roller and inking device are mounted, a spring-arm constituting a part of said frame, a projection from said arm coacting with said stop device on the inking-roller to limit the movement of the roller, a cam edge on said projection, and a lever to be actuated by the manipulation of the article to be printed to act on the cam edge to release the projection from the said stop device on the inking-roller.

697,514. MATCH-BOX-FILLING MACHINE. LOUIS KREYENFELD, Louis Kreymann, and ARTHUR REISS, Brussels, Belgium, assignors to La Societe Anonyme de Machines Industrielles, Brussels, Belgium. Filed Sept. 11, 1900. Serial No. 73,126. (No model.)

Claim.—1. In a machine for filling match-boxes the combination of frames carrying the matches; a hopper divided into longitudinal compartments each corresponding to a fixed number of rows of matches and a collector of the frames, a plurality of receivers, means for moving said receivers underneath the hopper and successively into alignment with the collector, and the rolls for discharging the contents of each receiver onto a collector, means for operating the collector to forward the matches from these receivers, means adapted to separate from the entire body of matches on the collector a determined quantity, a mechanical hand adapted to place these quantities into box-drawers, a rotating plate for advancing the drawers successively to this hand, and an inserting mechanism adapted to receive the filled drawers from the plate and place them into the box-covers.

2. In a match-box-filling machine the combination of a collector and a divided hopper with a plurality of receivers and means for moving the receivers successively into said line with the collector and means having movement longitudinally of said receivers for discharging the matches from the receiver into the collector.

3. In a match-box-filling machine the combination of a divided hopper terminating in chambers with inclined bottoms in combination with a frame adapted to be supported under said hopper, a plurality of receivers

on hinged to said frame, a connecting-rod articulated to said receivers so as to cause them to tilt simultaneously and on inclined plane adapted to form a tilting abutment to one of said receivers.

4. In a match-box-filling machine, a divided hopper 87 in combination with a plurality of receivers 87 having slotted walls, means for reciprocating said receivers under said hopper and stationary plates 90 parallel with the line of motion of the receivers extending from the lower chamber 91 of the divided hopper into the slots of the walls of the receivers.

5. In a match-box-filling machine the combination of a divided hopper, a plurality of receivers, a frame to which said receivers are hinged, a second frame in which the above said frame has limited sliding movement and carrying an inclined plane for tilting said receivers, and means for reciprocating the second frame substantially as set forth.

6. In a match-box-filling machine the combination of a hopper, a plurality of parallel receivers, and a collector, parallel to said receivers, a frame to which said receivers are hinged, a table having guides for said frame and means for limiting the sliding movement of the frame on the table, guides for said table, a notched sliding bar fixed to said table, a lever, means for vibrating said lever, a dog pivoted on said lever and adapted to engage the notched sliding bar in order to intermittently feed the table to bring the receivers successively into alignment with the collector, parts adapted to engage the sliding bar to prevent its return movement, means not in operation at the end of the travel of the table for disengaging said parts to permit of the return of the table under the hopper, and means for returning the table to its initial position.

7. In a match-box-filling machine the combination of a hopper, a plurality of receivers, a collector, means for advancing the receivers successively from under the hopper into alignment with the collector, a valve, means for moving the valve with to-and-fro movement and a guide-trust having a hinged crank on the side of the hopper, adapted to guide the valve so that it falls with its prongs behind the row of matches in the receiver, draws the matches into the collector and then rises in order to pass back over and engage the row of matches of the next following receiver.

8. In a match-box-filling machine the combination with a collector, consisting of two slotted side walls and a movable floor, of rollers loosely mounted in the slots of the said side walls above the bottom of the same adapted to bear with slight pressure on the body of matches when advancing along on the movable floor the said rollers having a grooved or roughened part and a smooth part of less diameter than the grooved part, and the floor of the collector having a longitudinal groove so that the rollers do not exercise pressure upon the heads of the matches.

9. In a match-box-filling machine the combination with a collector having slots in the bottom thereof, and solid portions intermediate of said slots adapted to uphold matches from falling therein, of a device for removing determined quantities from the body of matches advancing over said slots, the said device comprising fork-shaped plates and means for moving the same vertically in the slots in the bottom of the collector so as to raise from the floor of the collector the matches lying across said slots.

10. In a match-box-filling machine, the combination of separated supports adapted to hold a body of parallel matches bridging the space between them, of a gripping device comprising two fingers adapted when closed to inclose a space, means for operating said fingers to open, move toward said supports, close around said body of matches, and move from the supports in order to remove the body of matches without compression.

11. In a match-box-filling machine the combination of an oscillatory plate, a diametrical guide-bar thereon, a rod, a block adapted to slide on said guide-bar and pivoted to said rod, a cam integral with said block, a gripper comprising two articulated fingers, a shaft eccentric to said oscillatory plate carrying said gripper, a sleeve on said shaft having a projection and a recess, a pawl pivoted to said sleeve and adapted to coast with said cam, a pin on one of the gripper-fingers adapted to engage the recess and means for vibrating the oscillatory disk for the purpose set forth.

12. In a match-box-filling machine for causing the regular settlement of the matches in the box or drawer, the combination with a drawer feed-plate, of a pivoted rod, and means for vibrating the same to strike upon the upper open part of the drawer.

13. In a match-box-filling machine for inserting the boxes into their covers, the combination with a rotary notched feed-plate of a lever adapted to remove the filled drawers from the notches of the feed-plate, a chamber to receive the same, said chamber having a lateral opening, a notched wheel horizontally journaled by the side of said chamber and adapted to receive the outer covers of the match-boxes, and prevent them to the lateral opening of said chamber and a chute above the said wheel for supplying the covers to said wheel.

14. In a match-box-filling machine a drawer inserting device comprising in combination a rotary notched feed-plate, a lever adapted to remove the drawers consecutively from the feed-plate, a chamber for receiving said drawer, a notched wheel internally of said chamber for bringing the covers opposite the drawer therein, a plug for assuring the perfect centering of the cover during the insertion of the drawer, in combination with a sliding bar and a cam thereon for the displacement of the said lever and lever systems connecting the same with the notched wheel and the centering-stop, for simultaneous action, substantially as set forth.

697,515. COMBINED JACK AND DROP. KENNETH B. HILGREN, Chicago, Ill., assignor to Kallings Dutchboard & Supply Company, Chicago, Ill., a Corporation of Illinois. Filed Nov. 4, 1901. Serial No. 81,647. (No model.)

Claim.—1. In a combined jack and drop, a suitable frame, a sleeve mounted on the frame, a contact-spring carried by and insulated from the frame and adapted to be engaged by the plug when it is inserted in the sleeve, and a drop, said spring being constructed and arranged to engage and restore the drop when the plug is inserted in the jack, substantially as described.

2. In a combined jack and drop, a suitable support, a contact-spring mounted upon and insulated from the support and forming a line-terminal of the jack, and a drop also mounted upon the support, said spring being formed to engage and restore the drop when a plug is inserted in the jack, substantially as described.

3. The combination with a suitable frame, of a tip-contact spring mounted thereon, a leaf spring with which said tip-spring normally engages, a drop-extending magnet, the circuit of said magnet being normally completed through said spring, a drop, and a connecting-plate having a tip-contact adapted to engage the tip-spring to separate said spring and open the circuit through said magnet, said tip-spring being arranged to restore the drop upon the insertion of the plug, substantially as described.

4. In a combined jack and drop, the combination with a suitable supporting-structure, of a drop-extending magnet and a drop carried thereon, a line-spring mounted upon and insulated from said framework and having a forwardly-extending end adapted to engage and restore the drop when a plug is inserted in the jack, a leaf spring also carried by and insulated from said framework, the said line-spring being adapted to normally engage said leaf spring and to thereby close the circuit through the said magnet, whereby when the plug is inserted in the jack the circuit through the magnet is opened and the drop restored by the line-spring, substantially as described.

5. The combination with a drop-extending magnet and a drop, of a jack having a line-spring and a leaf spring mounted upon and insulated from the jack structure, said springs being normally in engagement and serving to complete the line-circuit through the drop, said line-spring having an extended end and upturned end to engage the drop when lifted, and a

connecting-plate adapted to engage and lift said line-spring when inserted in the jack, whereby the drop is restored and the magnet cut out, substantially as described.

6. In a combined jack and drop, a suitable support, a contact-spring mounted upon and insulated from the support and forming a line-terminal of the jack, said spring having a forwardly-extending end upturned end and a strip of insulation isolated upon said end, and a drop adapted to be engaged by said insulated upturned end and to be restored thereby when a plug is inserted in the jack, substantially as described.

7. In a combined jack and drop, the combination with a contact-spring forming one terminal of the jack, of a drop, and means restored by said spring for restoring the drop when a plug is inserted in the jack, substantially as described.

8. In a combined jack and drop, the combination with a drop, of a contact-spring forming one terminal of the jack and having an extension to engage and restore the drop when a plug is inserted in the jack, substantially as described.

9. In a combined jack and drop, the combination with a drop, of a contact-spring forming one terminal of the jack, of a sleeve forming another terminal of the jack, said spring having an extension to engage and restore said drop when a plug is inserted in the jack, substantially as described.

10. The combination with a jack and drop structure having a drop, a contact-spring forming one terminal of the jack, a sleeve forming another terminal of the jack, of a connecting-plate adapted to be inserted in the jack and having contacts to cooperate respectively with the terminals of the jack, and means controlled by said spring to restore the drop upon the insertion of the plug into the jack, substantially as described.

11. The combination with a jack and drop structure having a drop, a contact-spring forming one terminal of the jack, a sleeve forming another terminal of the jack, and a connecting-plate adapted to be inserted in the jack and having contacts to cooperate respectively with the terminals of the jack, said spring having an extension to engage and restore the drop when the plug is inserted in the jack, substantially as described.

12. A metallic-line drop and jack, comprising a framework, a sleeve mounted thereon, said framework and sleeve being connected with one side of the metallic line, a contact-spring mounted upon, but insulated from said framework and connected with the other side of the metallic line, a normal contact for the spring, a drop-extending magnet having its winding connected on one side with said framework and the other with said normal contact, a drop, said spring having an extension, and means actuated by said extension for restoring the drop when a plug is inserted in the jack, substantially as described.

13. A metallic-line drop and jack, comprising a framework, a sleeve mounted thereon, said framework and sleeve being connected with one side of the metallic line, a contact-spring mounted upon, but insulated from said framework and connected with the other side of the metallic line, a normal contact for the spring, a drop-extending magnet having its winding connected on one side with said framework and the other with said normal contact, and a drop, said spring having a forwardly-projecting end to engage and restore the drop when a plug is inserted in the jack, substantially as described.

14. In a combined jack and drop, the combination with a front plate, of a drop mounted upon said plate, and a contact-spring forming one terminal of the jack, said spring being extended through an aperture in said front plate to engage said drop and restore the same when a plug is inserted in the jack, substantially as described.

15. In a combined jack and drop, the combination with a front plate, of a drop mounted upon said plate, and a contact-spring forming one terminal of the jack, said spring being extended through an aperture in said front plate and having an upturned end to engage and restore the drop when a plug is inserted in the jack, substantially as described.

16. In a combined jack and drop, the combination with a front plate, of a drop mounted upon said plate, and a contact-spring forming one terminal of the jack, said spring being extended through an aperture in said front plate and having an upturned end to engage and restore the drop when a plug is inserted in the jack, said front plate and upturned end having an insulating-covering, substantially as described.

17. In a combined jack and drop, the combination with a front plate or support having a jack-socket therein and an aperture above the socket, of a jack-frame secured to the rear face of the front plate or support, a drop pivoted above the said aperture upon said plate or support, and a contact-spring mounted upon and insulated from the frame and forming one terminal of the jack, said spring having a contact portion disposed in line with said socket and a drop-extending portion extending above said socket and through said aperture, substantially as described.

18. In a combined jack and drop, the combination with a supporting-strip, of a jack-frame comprising a pair of side plates and front and rear bars joining them, the said front bar being placed against the rear face of the supporting-strip, a sleeve extending through the said support-

ing-strip and front bar to secure the said frame to the strip, said sleeve forming the jack-opening, a contact-spring forming one terminal of the jack mounted upon and insulated from said rear bar and having a contact portion disposed in line with said sleeve, the forward end of said spring being extended over said sleeve, and a drop adapted to be restored by said extended end when a plug is inserted in the jack, substantially as described.

19. In a combined drop and jack, the combination with a support, of a drop pivoted upon the face of said support, a drop-extending magnet secured to the rear face of said support, a jack-frame also secured to the rear face of the support, a sleeve extending through the support and into said frame and forming a terminal of the jack, and a contact-spring mounted upon and insulated from said frame and forming the other terminal of the jack, said spring being extended forward over the sleeve and through the support to engage and restore the drop when a plug is inserted in the sleeve, substantially as described.

697,516. FIREARM-LOCK. GEORGE F. HANCOCK, Flintburg, Mass., assignor to Harry Elmer Johnson, Flintburg, Mass., executor of the will of George F. Hancock, deceased. Filed Nov. 4, 1901. Serial No. 80,688. (No model.)

Claim.—1. The combination with a pivoted hammer provided with a notch to receive the trigger, a pivoted trigger adapted to engage said notch and hold the hammer in a cocked position and a hammer-spring by which said hammer is actuated, of a trigger-spring bearing against said trigger and a projection on said hammer arranged to receive the pressure of said trigger-spring, said projection having a shoulder arranged to abut against the end of said trigger-spring, said projection and said shoulder lying normally below the axis of said hammer, whereby the hammer is held out of contact with the firing-pin by the contact of said shoulder and said trigger-spring, substantially as described.

2. The combination of a pivoted hammer provided with a notch 30 to receive a trigger and a recess 17 to receive the ends of a hammer and a trigger spring, a hammer-spring and a trigger-spring, said hammer having a bearing-surface 26 to receive the pressure of said hammer-spring, and a projection 31 to receive the pressure of the trigger-spring, said projection having a shoulder 32 arranged to abut against the end of the trigger-spring, said projection and said shoulder lying normally below the axis of the hammer, whereby the hammer is held out of contact with the firing-pin by the contact of said shoulder and said trigger-spring, and a pivoted trigger having a projection 23 bearing against said trigger-spring and a tooth 23' engaging the notch in said hammer, substantially as described.

3. The combination with the frame of a firearm and a barrel hinged thereto and having a notch to receive a latch, of a latch pivoted at its upper end and having a downwardly-projecting tail-piece 10 extending through a slot in the frame, a spring by which said latch is held in said notch, a pivoted hammer provided with a notch 33 to receive said latch and a concave surface 19 by which said latch is locked in position, said hammer having a recess 17 to receive the hammer and trigger springs, a hammer-spring 26 and the trigger-spring 26 entering said recess, a projection 31 to receive the pressure of the trigger-spring, said projection having a shoulder 32 arranged to abut against the end of the trigger-spring, said projection and said shoulder lying normally below the axis of the hammer, substantially as described.

697,517. REVOLVING FIREARM. GEORGE F. HANCOCK, Flintburg, Mass., assignor to Harry Elmer Johnson, Flintburg, Mass., executor of the will of George F. Hancock, deceased. Filed Aug. 23, 1901. Serial No. 79,599. (No model.)

Claim.—1. The combination with the frame and barrel of a revolving firearm, of an arm pivoted at one end to the barrel, a cylinder carried by and capable of rotating on the free end of said arm, a right bar pivoted at one end to said arm, a spiral spring held in said arm with one end bearing against said bar to crowd it away from said arm, and a screw held in the arm and bearing against the opposite end of said spiral spring, substantially as described.

2. The combination with the frame and barrel of a revolving fire-

arm, of an arm pivoted at one end to the barrel, a cylinder carried by and capable of rotating on the free end of said arm, a right bar pivoted at one end to said arm, a spiral spring held in said arm with one end bearing against said bar to crowd it away from said arm, and a screw held in the arm and bearing against the opposite end of said spiral spring, substantially as described.

3. The combination with the frame and barrel of a revolving firearm, of an arm pivoted beneath said barrel, a cylinder journaled on the end of said arm, a spring applied to said arm to swing it on its pivot, a lug projecting from said arm, and a cover for the cylinder pivoted on said frame and bearing against said lug to hold the cylinder in its normal or firing position, substantially as described.

4. The combination with the frame and barrel of a revolving firearm, of an arm pivoted at one end beneath said barrel, a cylinder journaled on the free end of said arm and capable of swinging in a horizontal plane, a spring applied to said arm to swing said cylinder out of its normal firing position, a cover for said cylinder hinged at one end to said frame and bearing against said arm to hold the cylinder in its firing position and means for holding said cover against the pressure of the cylinder, substantially as described.

5. The combination with the frame and barrel of a revolving firearm, of a rotating cylinder held in said frame and in its normal position of firing, a cover including one side of said cylinder, said cover being hinged at its lower edge to said frame and having a lip at its upper edge, a locking plate forming the top plate of the frame and hinged beneath its center and a spring to carry one edge of said plate into engagement with said lip with the opposite edge of said plate forming a thumb-piece by which it is retracted to release said cover, substantially as described.

6. In a revolving firearm, the combination with a frame and a barrel carried therein and a revolving cylinder held in a firing position, a cover hinged to said frame and including said cylinder, a plate forming the top plate of the frame and hinged beneath its center and a spring acting on said plate to hold it in engagement with said cover, substantially as described.

7. The combination of a frame A and barrel B, of an arm-D pivoted at its end to said barrel and provided with a longitudinal slot H', a cylinder journaled on the free end of said arm, an ejector with its stem held in said arm, a spring to hold said ejector in its normal position and a knob H' projecting from said ejector-stem through said slot, and means for holding said cylinder on said arm during the sliding movement of said ejector, substantially as described.

697,518. BOOK-BINDER. GERRIT E. MOULTON, Washington, D. C. Filed Oct. 25, 1901. Serial No. 82,424. (No model.)

Claim.—1. A book-binder consisting of a supporting-base, and piece hinged to the upper end of the base sides to be elevated, means for holding the end pieces when elevated, and a table flanged on its under side and adapted to rest on the top of the base and the end pieces when the latter are folded and to rest on the free ends of the end pieces when the latter are elevated.

2. A book-binder consisting of a support, and piece hinged to the support to fold inwardly, springs operating to press the end pieces upwardly, and a table flanged on its under side and adapted to rest on the support and folded end piece and to rest on the end pieces when elevated by the springs.

697,519. BOX OR POUCH FILLS. WILLIAM B. HURRAY, Detroit, Mich. Filed Feb. 26, 1901. Serial No. 68,318. (No model.)

Claim.—A box for filling soap, composed of two plain side bars, a bottom bar upon which the side bars are supported and having upturned marginal flanges adapted to tie the side bars together at the bottom, a tie of hand-iron laid across the top of the side bars in the middle and having short ends turned down upon the outside of the side bars for tying the same together at the top, and a top placed over said tie, the top-down ends of which tie are exposed beyond the cover and sides to be turned off in heating the soap.

697,520. NUT-LOCK. IRON M. McCORMACK, Bureau, Ohio. Filed Aug. 28, 1901. Serial No. 72,897. (No model.)

Claim.—1. The combination of a threaded bolt, a nut secured thereon, an external screw-thread on said nut of a greater pitch than that of the thread on the bolt, a nut secured thereon, and means to prevent rotation of the same, substantially as shown and described.

2. In combination, a threaded bolt, a nut secured thereon, an external screw-thread on said nut of a greater pitch than that of the thread on the bolt and adapted to receive a second nut, a washer-plate having a perforation for the passage of the bolt, a projection at the edge of the perforation to enter an enlargement of the bolt-head and prevent rotation of the washer, and a tongue on the outer edge of the washer adapted to be turned up against the outside nut, substantially as and for the purpose described.

697,521. FINISHING-MACHINE FOR GLASSWARE. WALTER R. McCLAY, Wood, Ind. Filed Apr. 8, 1901. Serial No. 64,308. (No model.)

Claim.—1. In a machine for expanding and improving the tubular end of glass articles while in a plastic state, the combination of a rotating cylinder, fingers secured to said cylinder, the free ends of said fingers converging to a common center, leaders secured to said cylinder and capable of a horizontal movement, means for operating the forward ends of said fingers and said leaders, transversely to their lengths.

2. In a machine for expanding and improving the tubular end of glass articles while in a plastic state, the combination of a rotating cylinder, spring-actuated fingers secured to said cylinder, leaders spring-actuated and capable of a horizontal movement secured to said cylinder and a spreader, means for advancing it horizontally.

3. In a machine for expanding and improving the tubular end of glass articles while in a plastic state, the combination of a rotating cylinder, spring-actuated fingers secured to said cylinder, leaders, spring-actuated and capable of a horizontal movement secured to said cylinder, and a spreader operating said fingers and said leaders.

4. In the approximately simultaneous expanding and improving of the end of a glass article while in a plastic state, means for expanding said end and secondary means for improving outwardly said expanded end.

697,522. GUARD-RAIL. THOMAS MCINTYRE, Matthews, Ind. Filed Sept. 8, 1901. Serial No. 74,897. (No model.)

Claim.—1. A guard-rail having inwardly-bent ends and provided with a head projecting a greater distance in one direction from the web than in the opposite direction, said guard-rail having a series of notches in one of its flanges for the reception of fastening devices.

2. The combination with a main rail, of a guard-rail having one of its flanges abutting against a flange of the main rail, said guard-rail having a series of notches in its flange which abut against the flange of the main rail, and fastening devices passing through said notches, the head of said rail projecting a greater distance toward the main rail than in the opposite direction.

3. As an article of manufacture, a guard-rail having one side of its head or tread projecting an appreciably greater distance from its central web than the other side of said head or tread and a series of notches in the edge of the base-flange on the same side of the rail as the enlarged side of the head or tread.

697,523. VEL-ROLLER. HANAN E. McCRACK, Germantown, Pa. Filed Nov. 11, 1901. Serial No. 61,508. (No model.)

Claim.—A fastening device for veils and similar hat ornaments comprising two wires wound into each other to form a twisted base, the free ends of one of the wires projecting downward from said base and arranged to enter the brim of the hat and to be fastened thereto and the free ends of the other wire projecting upward from said base and adapted to be bent inward in opposite directions toward each other to encircle the knot of the veil or ornament, said free ends when bent projecting beyond the knot as to be readily accessible when the free ends are subject to release said knot.

697,524. ROLLER-BUSHING FOR SHEAVES. CLARENCE E. McINTYRE, Camden, Me. assignor to the Dupont Roller Bushing Company, Camden, Me., a Corporation of Maine. Filed May 28, 1901. Serial No. 61,509. (No model.)

Claim.—A roller-bushing comprising two opposable bushing members adapted to enter a sheave or pulley, and having positive connecting devices at their meeting inner ends, each member having a cylindrical recess in its inner side, the margin of which forms a runway, and an annular flange at its outer end forming an end wall of the recess, said flange having in its inner side an annular groove separated from the runway margin and from the inner edge of the flange by outer and inner annular bearing-surfaces, a series of bearing-rolls in contact with the cylindrical margin of the chamber and having transverse projecting into the

grooves of the flange, and a series of separating-rolls in contact with the said cylindrical margin and with the bearing-rolls, the ends of the separating-rolls bearing against the outer bearing-surfaces, while the ends of the bearing-rolls bear against both the outer and the inner bearing-surfaces.

697,525. BALL-BEARING HUB. DONALD McKAY, Pittsburgh, Pa. Filed July 20, 1901. Serial No. 68,131. (No model.)

Claim.—In a device of the class described, the combination of a spindle, a hub provided at its ends with interior screw-threads, the inner and outer axle-box sections provided with outer enlarged ends having annular grooves, the inner and outer ball-caps provided with annular grooves, the inner ball-cap being fixed to the inner end of the spindle and the outer ball-cap being internally threaded for engaging the outer threaded end of the spindle, the anti-friction-balls arranged in the annular grooves and supporting the axle-box sections out of contact with the spindle, the axle-box, the washer interposed between the nut and the outer ball-cap and interlocked with the spindle, the outer cap closing the outer end of the hub and engaging the outer screw-threads of the same, and the inner washer engaging the screw-threads of the inner end of the hub and fitting against the inner ball-cap and closing the inner end of the hub, substantially as described.

697,526. BOLT AND CHIEF GUARD FOR RAILWAY COACHES OR PASSENGER CARRIAGES. JAMES S. McINTYRE, Birmingham, Ala. Filed July 2, 1901. Serial No. 64,309. (No model.)

Claim.—The combination with the window-casing and the lower rail of the lowermost coach, of a longitudinally-grooved cabinet secured to the main sill of the window-casing, and a dust and choler guard comprising a semi-cylindrical pan having a longitudinal vertically-disposed front flange which is arranged adjacent to but separate from the inner face of the lower rail and provided with a longitudinal rib to fit said groove of the cabinet, and a discharge-pipe leading from said pan to a point without the coach, substantially as set forth.

697,527. BOLT AND CHIEF GUARD FOR ALL KINDS OF RAILWAY PASSENGER-CARRIAGES. JAMES S. McINTYRE, Birmingham, Ala. Filed July 2, 1901. Serial No. 64,310. (No model.)

Claim.—1. The combination with the window-casing of a railway passenger-coach, of a dust or choler pan located at the lower end of the window-casing, a flexible shield movable across the window-opening and having its lower end disposed to conduct dust and choler, entering the window-opening, into the pan, substantially as set forth.

2. The combination with the window-casing of a railway passenger-coach, of a dust or choler pan located at the lower end of the window-casing, a flexible shield movable across the window-opening and having its lower end disposed to conduct dust and choler, entering the window-opening, into the pan, substantially as set forth.

3. The combination with the window-casing of a railway passenger-coach, of a dust or choler pan located at the lower end of the window-casing, a flexible shield movable across the window-opening and having its lower end disposed to conduct dust and choler, entering the window-opening, into the pan, and means for holding the shield in its adjusted position across the window-opening, substantially as set forth.

4. The combination with the window-casing of a railway passenger-

coach, of a dust or choler pan located at the lower end of the window-casing, a brush located within said pan, and a flexible shield movable across the window-opening and having its lower end disposed to conduct dust and choler, entering the window-opening, into the pan, substantially as set forth.

697,528. TELEPHONE. ARTHUR W. BAKER, Boston, U.S.A. Filed June 12, 1901. Serial No. 64,311. (No model.)

Claim.—1. The combination with a receiver, of a disk secured to the back thereof, a contact-plate secured to said disk and having one of the conducting-arms connected therewith, a spring-actuated button secured to said disk and having a conducting-arm connected therewith, whereby when said button is pressed the circuit is closed, and when the pressure is relieved the circuit is broken, substantially as described.

2. The combination with a receiver, of a disk of insulating material secured to the back thereof, a wire or conductor leading into said disk, a plate located in a central opening in said disk and secured at one end to said disk, a wire or conductor secured to said plate, and a spring located between said plate and receiver, whereby said plate when pressed, contacts with said first conductor, and separates therefrom when the pressure is released, substantially as described.

3. The combination with a receiver, of a disk secured thereto and provided with a central opening, the conductor of leading into said disk, the plate occupying the opening in said disk and having a button secured to the outer side thereof, a wire or conductor indirectly connected with said plate and a spring located between said receiver and plate, whereby when said button is pressed, its attached plate will contact with said conductor, substantially as and for the purpose set forth.

697,529. METHOD OF RENDERING SHARP AND EVEN CUTTING EDGES OF IMPLEMENTS. GEORGE H. HUNTER, San Francisco, Cal. Filed Mar. 28, 1901. Serial No. 62,497. (No model.)

Claim.—The art of rendering a metallic cutting edge in proper condition, consisting in rendering the same in proximity to a magnet with its edge directed toward the magnet.

697,530. THERMO-ELECTRIC SWITCH. JAMES S. McINTYRE, Birmingham, Ala. Filed Sept. 12, 1901. Serial No. 75,148. (No model.)

Claim.—1. In a thermo-electric switch the combination with a base of a resilient, insulating line-support, a line carried thereby, metallic ter-

6. In a locomotive of the class described, the combination of a frame portion provided with a set of main driving-wheels, front guiding and rear trailing wheels, equalizing mechanism pivoted upon the frame of the machine and connecting the different sets of wheels together to normally distribute the weight in proper proportion upon said wheels, an operating-lever pivoted to the frame of the machine and to the equalizers in the front of the locomotive, a second operating-lever pivoted to the frame of the locomotive and the equalizer at the rear of the locomotive, an intermediate lever pivoted to both said operating-levers, an operating-cylinder provided with a movable piston connected with each intermediate lever to simultaneously move both of said operating-levers and redistribute the weight upon the wheels, a supply-pipe connecting the operating-cylinder with a source of motive fluid, and a controlling-valve in each supply-pipe connected with the reversing-lever of the locomotive and provided with a passage to admit motive fluid gradually to the operating-cylinder, substantially as described.

7. In a locomotive of the class described, the combination of a frame portion provided with a set of driving-wheels, front guiding and rear trailing wheels, equalizing mechanism for distributing the weight of the locomotive upon these wheels, and means for gradually operating the equalizing mechanism to redistribute and rearrange the weight upon these wheels, substantially as described.

8. In a locomotive of the class described, the combination of a frame portion provided with a set of main driving-wheels, front guiding and rear trailing wheels, equalizing mechanism pivoted upon the frame of the machine and connecting the different sets of wheels together to normally distribute the weight in proper proportion upon said wheels, operating-levers pivoted to the frame of the machine and to the equalizers, and means for actuating these operating-levers in a gradual manner, substantially as described.

697,586. LOCOMOTIVE. JOHN PLATER, Tipton, Ind. Filed Aug. 10, 1901. Serial No. 71,563. (No model.)

Claim.—1. In a locomotive of the class described, the combination of a frame portion provided with a set of driving-wheels, front pilot and rear trailing wheels, equalizing-lever mechanism for distributing the weight upon the rear trailing wheels, an operating-lever connected with this equalizing-lever mechanism, and a fluid-pressure cylinder connected with the operating-lever and with the frame portion of the locomotive to move the operating-lever, raise the equalizing-lever mechanism and throw a portion of the load upon the said main driving-wheels, substantially as described.

2. In a locomotive of the class described, the combination of a frame portion provided with a set of driving-wheels, front pilot-wheels and rear trailing wheels, equalizing mechanism for the front pilot-wheels, an op-

erating-lever connected to the frame and pivoted to the equalizing mechanism for the front guiding-wheels, an operating-cylinder provided with a piston-rod connected to the operating-lever to move the same and thereby raise the equalizer and throw a portion of the load upon the front pilot-wheels upon the set of main drivers, substantially as described.

3. In a locomotive of the class described, the combination of a frame portion, a set of main drivers, front pilot-wheels and rear trailing wheels, equalizing mechanism connected with the front pilot-wheels and with the main drivers and with the rear trailing wheels to equalize or distribute the weight thereon, an operating-lever connected with the equalizers adjacent to the rear trailing wheels and pivoted to the frame and provided with a piston connected with the operating-lever to operate the same and throw a portion of the load from the rear trailing to the set of main drivers, a second operating-lever pivoted to the frame and with the equalizers adjacent to the front pilot-wheel, and an operating-cylinder connected with the frame and provided with a piston to the second operating-lever to move the same and throw a portion of the load from the front pilot-wheel to the set of drivers, substantially as described.

697,587. BASKET. JOHN R. FARRER, Belleville, Ill. Filed May 26, 1901. Serial No. 68,671. (No model.)

Claim.—1. A basket comprising a bottom upper and lower and handle bands provided with lips or hangers, and sides composed of a single piece of wire bent to extend back and forth between the top and bottom bands and having the upper and lower portions thereof in engagement with the lips or hangers of the top and bottom bands.

2. A basket comprising a bottom top and bottom bands having downwardly and upwardly projecting malleable hangers respectively, and sides composed of a single length of wire bent to extend upward and downward between the top and bottom bands and having its upper and lower portions bent over and beneath the top and bottom bands respectively and engaged with the malleable lips or hangers thereof.

3. A basket comprising a bottom top and bottom bands of malleable metal having their top and bottom edges respectively beveled and bent downward and upward upon the outer sides thereof to form hangers, and sides composed of a single length of wire bent to extend back and forth between the top and bottom bands and having its upper and lower portions engaged beneath the hangers thereof.

4. A basket comprising a bottom top and bottom bands provided with malleable hangers, sides composed of a single piece of wire bent to extend back and forth between the top and bottom bands and having its upper and lower portions in engagement with the hangers, and an intermediate band provided with clips in engagement with upright portions of the wire forming the sides of the basket.

5. A basket comprising top and bottom bands, a bottom consisting of a single plate having radiating arms having their edges bent to form reinforcing and supporting flanges, and an auxiliary wire bottom supported thereon and consisting of an inverted coil of wire connected at intervals to the supporting-bottom.

6. A basket comprising top and bottom bands, sides composed of wire extending back and forth between the top and bottom bands, a supporting-bottom comprising radiating arms provided with pendent flanges which reinforce the bottom and form a support for the basket as a whole, and an auxiliary wire bottom in the form of an inverted coil of wire secured at intervals to the supporting-bottom, substantially as described.

697,588. GRATE. CHARLES E. PROCTOR, Montreal, Canada. Filed Feb. 26, 1901. Serial No. 68,664. (No model.)

Claim.—1. The combination with a stationary fire-pot, of a conical cylindrical integral fire-grate presenting a permanently-flush fuel-supporting surface of twice the area of the bottom opening in the fire-pot, the extended area of each supporting surface being bladed, and means adapted either to reciprocate or oscillate said grate so as to cause the bladed portion to completely close each bottom opening of the fire-pot, substantially as described and for the purpose set forth.

2. The combination with a stationary fire-pot, of a movable fire-grate twice the width of that of the bottom opening of the fire-pot, of less

length than the supporting frame thereof and having its portion of extended width bladed, the whole presenting a permanently-flush fuel-supporting surface and means adapted to either reciprocate or oscillate said grate, for the purpose set forth.

2. The combination with a stationary fire-pot having an oblong bottom opening, of a conical cylindrical grate of twice the circumferential length of the width of said bottom opening, said grate comprising an open-grate portion and closed or bladed portion and the ends of the half-circle so formed connected by bars extending transversely of the grate; a shaft upon which said bars are mounted, and means connected to said shaft adapted either to reciprocate or oscillate said grate to cause either said open portion or bladed portion to extend across the bottom opening of the fire-pot, substantially as described and for the purpose set forth.

3. The combination with a fire-pot having an oblong bottom opening, of a conical cylindrical grate of twice the circumferential length of the width of said bottom opening, said grate comprising an open-grate portion and a closed or bladed portion, which together present a permanently-flush fuel-supporting surface, and means adapted to either oscillate said grate to cause said open portion or bladed portion to extend across said bottom opening of the fire-pot, or to reciprocate said grate longitudinally of said bottom opening, substantially as described and for the purpose set forth.

4. The combination with a fire-pot having an oblong bottom opening, of a conical cylindrical grate of twice the circumferential length of the width of said bottom opening, said grate comprising an open-grate portion of as great area as said bottom opening, and the ends of the half-circle so formed connected by bars extending transversely of the grate; a shaft upon which said bars are mounted, and means adapted either to reciprocate or oscillate said grate to cause either said open portion or bladed portion to extend across said bottom opening of the fire-pot, substantially as described and for the purpose set forth.

5. The combination with a fire-pot having an oblong bottom opening, of a conical cylindrical grate of twice the circumferential length of the width of said bottom opening, said grate comprising an open-grate portion of as great area as said bottom opening, and a closed or bladed portion of as great area as said bottom opening, which portions together present a permanently-flush fuel-supporting surface, and means adapted to either oscillate said grate to cause said open portion or bladed portion to extend across said bottom opening of the fire-pot, or to reciprocate said grate longitudinally of said bottom opening, substantially as described and for the purpose set forth.

6. The combination with a stationary fire-pot, of an oscillating conical cylindrical grate comprising an open-grate portion and a closed or bladed portion and means adapted either to oscillate or reciprocate said grate, substantially as described and for the purpose set forth.

7. The combination with an oscillating grate and its operating-shaft, of a part rotatable with said shaft; means for covering said part against longitudinal movement with said shaft; a lever extending transversely of said shaft and fastened at one end to said part; and means pivotedly connecting said lever midway of its length to said shaft, substantially as described and for the purpose set forth.

8. The combination of the front frame-plate of a stove; a fire-pot having an oblong bottom opening; an oscillating conical cylindrical grate comprising an open axial grate portion and a closed or bladed axial grate portion; a squared shaft for oscillating said grate; a cross-bar rotatable with said shaft; a hub integral with said cross-bar midway of the length thereof and projecting through and rotatable in an opening in said frame-plate and having a squared opening to allow the passage of the squared end of said shaft therethrough; a pair of flanges integral with the periphery of said hub and located one on each side of said frame-plate; a pair of steps for limiting the oscillatory movement of said cross-bar; a lever extending transversely of said shaft and pivotedly connected midway of its length thereto; and a link interconnecting one end of said lever to the corresponding end of said cross-bar, substantially as described and for the purpose set forth.

697,589. BOAT. CHARLES E. PROCTOR, Montreal, Canada. Filed July 12, 1901. Serial No. 68,665. (No model.)

Claim.—1. A boat comprising side sections adapted to be arranged contiguous to each other and capable of being spaced apart, said sections being provided at their rear portions with inner recesses adapted to form a pocket when the side sections are arranged together, and a rear section conforming to the configuration of the pocket and located between the rear portions of the side sections, substantially as described.

2. A convertible boat comprising separable tapering side sections having abutting inner sides and forming a boat of the ordinary configuration and providing a tapering bow, said side sections extending the entire length of the boat and capable of being spaced apart to form a boat of the catamaran type, and means for rigidly connecting the sections, substantially as described.

3. A boat comprising side sections provided at their rear portions with recesses to form a pocket, said side sections being adapted to be arranged contiguous to each other and to be spaced apart, and a rear section arranged in the said pocket and adjustably connected with the side sections and adapted to be raised and lowered independently of the side sections, substantially as described.

4. A boat comprising the side sections provided at their inner walls or sides with straight front portions and having curved rear portions to form a pocket, and the pointed rear section conforming to the configuration of the pocket and adjustably connected with the side sections, substantially as described.

5. A boat comprising the separable side sections arranged contiguous to each other to form a boat of the ordinary construction and capable of being spaced apart to provide a boat of the catamaran type, cross-bars connecting the side sections, and the vertically-adjustable rear section mounted independently of the side sections and adjustably connected with the adjacent cross-bars, substantially as described.

6. A boat provided with a vertically-adjustable propeller section mounted independently of the rest of the boat and designed to contain the propelling mechanism and capable of being arranged at different depths to permit the propeller to operate in both deep and shallow water, and means for securing the propeller-section in its adjusted position, substantially as described.

7. A boat having a propeller-section arranged within the contour of the body portion and vertically movable independently thereof and with relation thereto to raise and lower the propeller, and means for securing the propeller-section against independent lateral movement.

8. A catamaran boat having a rear pocket and provided therein with a vertically-movable rear propeller-section mounted independently of the rest of the boat and capable of adjustment to position a propeller properly, substantially as described.

697,540. RAILROAD-CROSSING. EDWARD E. RAWLINSON, St. Louis, Mo., assignor of one-fourth to Roger P. Amos, St. Louis, Mo. Filed June 8, 1901. Serial No. 68,567. (No model.)

Claim.—1. In a railroad-crossing, the combination with a continuous rail and crossing-rails at angles thereto; of a series of members having inclined tracks extending to a common center at the junction of said rails, bolts passing horizontally through said members and removably securing them to said rails, whereby the strain on said members will be borne by said rails.

2. In a railroad-crossing, the combination with a continuous rail and crossing-rails, at angles thereto; of a series of members having inclined tracks extending to a common center at the junction of said rails, bolts passing horizontally through said members and removably securing them to said rails, and said members also having curved feet bearing against the base of said crossing-rails, whereby the strain on said members will be borne by said crossing-rails.

3. In a railroad-crossing, the combination with a continuous rail and crossing-rails, at angles thereto; of a double-inclined member having inclined tracks extending upwardly from the ends thereof to an apex, and a pair of members having single-inclined tracks extending upwardly from their outer ends and arranged to abut against said double-inclined member at the apex thereof, all of said members being removably connected to the rails of said crossing-rails by means of bolts passing horizontally

through and having curved feet bearing upon the base of said rails, whereby the strain on said members will be borne by said rails.

4. In a railway-crossing, the combination with a continuous rail, a notch in the tread of the same, and cross-rails positioned at angles thereto; of a double-inclined member positioned beside said continuous rail and having inclined tracks extending upwardly from the ends thereof in an open, a pair of members positioned beside said cross-rails and having single-inclined tracks extending upwardly from their outer ends, the inner end of one of said single-inclined members abutting said continuous rail, the tread of the same extending through the notch in said continuous rail and abutting the tread of the double-inclined member at the apex, the other inclined member being provided with a tongue on its inner end, said tongue adapted to fit between the tread and feet of the double-inclined member and to hold the tread of said inclined member in abutment against the tread of the double-inclined member at the apex thereof.

697,541. WICK FOR HYDROCARBON-BURNERS. WILLIAM KEAR, Birmingham, Mass., assignor to Charles F. Brown, Reading, Mass. Filed June 17, 1901. Serial No. 64,518. (No model.)

Claim.—1. A flat wick with having its upper end provided with an asbestos collar in contact with both sides thereof and adapted to form a seal to retain the carbon formed by burning the end of the wick.
2. A flat wick with having its upper end provided with an asbestos collar, the material of the collar at the two edges of the wick being cut away or beveled for the purpose described.

697,542. GOLF-CLUB. WILLIAM BARNHART, Germantown, Pa. Filed Aug. 27, 1900. Serial No. 24,220. (No model.)

Claim.—A golf-club A having a groove a at the upper end of which a "guide" is hingedly attached to said club at all for the purpose and substantially as set forth.

697,543. BOOKS FOR TUG-GRAPES. WILLIAM E. BIRD, Birmingham, Mass. Filed May 1, 1901. Serial No. 64,501. (No model.)
Claim.—1. The combination with a frame comprising a base plate and spaced flanges thereon, of a tongue-plate pivoted at one end between

said flanges, and detachably secured at the other end thereof by a transverse bolt, and a stud projecting from the tongue-plate through a perforation in the base-plate.

2. The combination with a base-plate having spaced flanges at the sides thereof and spaced perforations in said base-plate, of a tongue-plate having a tabulation at each end, a pivot-rod engaging one of said tabulations and fixed in the spaced flanges near one end thereof, one at the opposite end of the flanges, having aligned perforations, and a bolt having engagement with the one end and also with the remaining tabulation on the tongue-plate.

697,544. ALLOY. WALTER EHRH, Ludwigshafen, Germany. Filed Dec. 8, 1901. Serial No. 54,022. (No specimen.)
Claim.—An alloy composed of aluminum and phosphorus containing from four to seven per cent. of phosphorus.

697,545. PROCESS OF MAKING INDIGO. TRANSDONT BARNHART, Bielefeld, Germany, assignor to Indigo Colour and Extract-Works, formerly John R. Selig, Bielefeld, Germany, a Corporation. Filed Aug. 28, 1901. Serial No. 71,908. (No specimen.)

Claim.—The herein-described process of producing indigo which consists in treating alpha-thiobenzene, made by reacting with calcinated hydrogen upon an acid solution of alpha-thiobenzene, with a suitable alkaline solution in presence of calcinated hydrogen substantially as set forth.

697,546. PACKING-GASKET. JAMES J. BROWN and ARTHUR BROWN, Milwaukee, Wis. Filed Jan. 2, 1902. Serial No. 64,102. (No model.)

Claim.—1. A packing-gasket consisting of a ring of compressible soft metal or metallic composition and a harder metallic ring in crimped tongue-and-groove connection one within the other.
2. A packing-gasket consisting of a ring of compressible soft metal or metallic composition having an annular tongue, and a harder metallic ring provided with an annular groove in which the tongue of the former ring is crimped.

697,547. WATER-MOTOR. BENJAMIN SUMNER, Milwaukee, Wis. Filed June 28, 1901. Serial No. 64,501. (No model.)

Claim.—1. A water-motor, comprising a motor-wheel; an including case; a wheel-supporting shaft having journal-bearings in the walls of said case; a discharge-nozzle having its discharge end in close proximity to the buckets of said wheel; a coupling, comprising an exterior elastic sleeve adapted to be clamped to the exterior wall of the nozzle; an interior elastic sleeve, or packing, adapted to be forced outwardly by the water-pressure, against the interior wall of said nozzle; and an elastic clamping-band for clamping said exterior sleeve to the nozzle, as set forth.

2. The combination of a motor-wheel A; an including case comprising two separable parts, provided with outwardly-projecting flanges F, and clamping-pieces H fitted to said clamping-flanges; a wheel-supporting shaft B having journal-bearings in the walls of said case; a per-

forated bottom piece K, including the lower end of said case; a discharge-nozzle H; and means for connecting said case to the nozzle, substantially as set forth.

3. In a water-motor, the combination with a water-wheel A, comprising two side plates F, F', and an annular series of buckets G, secured at their sides to said vertical plates; a supporting-shaft B; and including case D, said shaft B having journal-bearings in the walls of said case; a discharge-nozzle K; means for suspending said case from a fixed support, comprising a flexible metallic collar H secured to the exterior wall of the nozzle; an interior rubber collar L, having bearings against the interior wall of the nozzle; a flexible clamping-band M; and means for securing said clamping-band around said collar, substantially as and for the purpose specified.

697,548. HYDRAULIC-MOTOR. HARRAN SHAW, New York, N. Y. Filed July 28, 1901. Serial No. 64,501. (No model.)

Claim.—1. An improved article of manufacture, an enveloping-tube comprising a hollow tube or barrel having a closure at one end, a pad held in the opposite end of the barrel and arranged to project therefrom, and a removable buffer or guide at the end of the barrel, the said guide having its outer portion formed into a loop and having a shank extending into the barrel between the pad and the wall of the barrel.

2. A device of the kind described, comprising a hollow tube or barrel having a closure at one end, a porous pad held in the opposite end of the barrel as to project therefrom, and a spring buffer or guide held in the end of the barrel next the pad, the said guide abutting with the pad when it projects from the barrel and having spring members extending into the barrel between the wall thereof and the pad.

3. The combination with the hollow tube or barrel, having a closure at one end, with a pad in the opposite end of the barrel, of a spring-buffer projecting from the padded end of the barrel, the buffer having its outer portion made in the form of a loop, engaging in parallel spring members, the said members lying in the tube between the wall thereof and the pad.

697,549. DRAFT-SQUALLER. JOHN S. CRAWFORD, Boston, Wis. Filed Aug. 27, 1901. Serial No. 71,921. (No model.)

Claim.—1. An improved draft-squaller of the class described, comprising, in combination with the vehicle-axle and the pole connected therewith, a draft-squaller having an elongated transverse slot in the center through which it is pivotally mounted on the pole, draft-squaller connected with the ends of the draft-squaller, pulleys secured to the axle, a pulley having an elongated block adjustably connected at each end with the draft-squaller, and a chain passing around said pulleys and secured at its ends to the ends of the draft-squaller.

2. An improved draft-squaller of the class described, comprising, in combination with the vehicle-axle and the pole connected therewith, a draft-squaller having an elongated transverse slot in the center through which it is pivotally mounted on the pole, draft-squaller connected with the ends

of the draft-squaller, pulleys secured to the axle, a pulley having an elongated block adjustably connected at each end with the draft-squaller, a chain passing around said pulleys and secured at its ends to the ends of the draft-squaller, and draft means connected with the elongated block and extending forward.

697,550. PRESS FOR PRESSING LINOLEUM. GEORGE H. BURT, Gloucester, England. Filed Feb. 27, 1901. Serial No. 64,500. (No model.)

Claim.—1. In a press suitable for pressing linoleum and similar material, the combination of a roll, a pressure-plate arranged adjacent to and made concave on the side next said roll, reciprocating means connected to one of said parts for moving it toward and from the other part and means for actuating said reciprocating means as to subject material located between them to intermittent pressure.

2. In a press suitable for pressing linoleum and similar material, the combination of a roll, a pressure-plate arranged adjacent to and made concave on the side next said roll, hydraulic rams connected to one of said parts for reciprocating it toward and from the other part, hydraulic pumps adapted to reciprocate said rams, and means for reciprocating the pump-plungers and causing them to make their strokes and counter-strokes together.

3. In a press suitable for pressing linoleum and similar material, the combination of a roll, a pressure-plate arranged adjacent to and made concave on the side next said roll, hydraulic rams connected to one of said parts for reciprocating it toward and from the other part, hydraulic pump-plungers adapted to reciprocate said rams, means for reciprocating the pump-plungers and causing them to make their strokes and counter-strokes together, an auxiliary pump adapted to supply water to the main pumps, on the outer ends of their plungers, and safety devices adapted to allow of the escape of surplus water from said main pumps on the strokes of their plungers.

4. A press suitable for pressing linoleum and similar material, comprising a pressure-plate having a concave pressing face, a roll arranged in proximity to the concave face of said plate, hydraulic rams connected to one of said parts for reciprocating it toward and from the other part, hydraulic pump-plungers for operating said rams, and oppositely-arranged rotary means for operating said pumps.

5. A press suitable for pressing linoleum and other material, comprising a stationary frame, a hollow pressure-plate fixed thereto and having a concave pressing-face; means for heating said pressure-plate, a roll

arranged parallel to said pressure-plate and adjacent to its concave face, means for reciprocating said roll to and from said pressure-plate, means for rotating said roll in an intermittent manner, and means for guiding material to be pressed between said pressure-plate and roll.

6. A press suitable for pressing linoleum and other material, comprising a stationary frame, a hollow pressure-plate fixed thereto and having a concave pressing-face, means for heating said pressure-plate, a roll arranged parallel to said pressure-plate and adjacent to its concave face, means for reciprocating said roll to and from said pressure-plate, hollow hot plates arranged at the back of and below said roll, means for heating said pressure and hot plates, and means for guiding material to be pressed between said roll and the hot and pressure plates, substantially as described.

7. In a press suitable for pressing linoleum and similar material, the combination of a roll, a pressure-plate arranged adjacent to and made concave on the side next said roll, hydraulic rams connected to one of said parts for reciprocating it toward and from the other part, hydraulic plunger-pumps adapted to reciprocate said rams, and cranks connected to said plungers and arranged to cause them to make their strokes while the cranks are turning in a direction away from said plungers.

8. A press suitable for pressing linoleum and similar material, comprising a stationary frame, a hollow pressure-plate fixed to the upper part thereof and having a concave lower pressing-face, a roll arranged below said pressure-plate, mounted in bearings arranged to reciprocate in said frame, and provided with means for rotating it, hydraulic cylinders fixed to said frame and fitted with rams connected to said bearings, hydraulic plungers arranged to compress water within said cylinders, cranks and connections for reciprocating said plungers, an auxiliary pump connected to said hydraulic cylinders and adapted to supply water thereto on the contraction of their plungers, and safety-valves to allow of escape of surplus water from said cylinders after a predetermined pressure has been reached on the intake of said plungers, substantially as described.

9. In a press suitable for pressing linoleum and other material, the combination of a stationary pressure-plate having a concave pressing-face, a roll arranged parallel to said pressure-plate and near to its concave face, bearings for said roll, hydraulic rams connected to said bearings, guide-ways for said bearings, hydraulic cylinders for said rams, a crank-shaft located between said hydraulic cylinders, plungers arranged at the outer side of said cylinders and capable of compressing liquid within said cylinders, and driving means connected between said crank-shaft and plungers for causing the latter to make their strokes and contract together.

10. In a press suitable for pressing linoleum and other material, the combination of a stationary pressure-plate having a concave pressing-face, a roll arranged parallel to said pressure-plate and near to its concave face, bearings for said roll, hydraulic rams connected to said bearings, guide-ways for said bearings, hydraulic cylinders for said rams, a shaft located between said hydraulic cylinders and provided with cranks arranged opposite to each other, plungers arranged at the outer side of said cylinders and capable of compressing liquid within said cylinders, and driving means connecting the outer ends of said plungers to the oppositely-arranged cranks, substantially as described.

11. A press suitable for pressing linoleum and other sheet material, comprising a stationary frame, a pressure-plate fixed to the upper part of said frame and having a concave pressing-face, a roll arranged horizontally below said pressure-plate and near to the concave face thereof and mounted in bearings arranged to work in guide-ways in said frame, vertical hydraulic cylinders fixed to said frame and provided with rams connected to said bearings, horizontal plungers arranged to work through the outer sides of said cylinders, a transverse rotary shaft located between said cylinders and provided with three cranks two of which are arranged directly opposite to the third, means connecting two of said cranks to the outer end of one plunger and the third crank to the outer end of the other plunger, a pump adapted to supply liquid to said cylinders on the stroke of their plungers, and safety-valves adapted to allow of escape of surplus water from said cylinders on the intake of said plungers, substantially as described.

12. A press suitable for pressing linoleum and similar material, comprising a stationary frame, a hollow pressure-plate fixed to the upper part thereof and having a concave pressing-face, hot plates fixed to the back and lower part of said frame, means for heating said plates, a roll mounted below said pressure-plate, vertical hydraulic cylinders fixed to said frame and fitted with rams carrying bearings in which said roll is mounted, horizontal plungers working in the outer side of said cylinders, separate pairs of inner and outer crank-hands connected together and to the outer end of each plunger, a transverse crank-shaft arranged between said cylinders and having oppositely-arranged cranks connected to the inner ends of each plunger, means for rotating said shaft, an auxiliary pump driven from said shaft and connected to said cylinders, safety-valves for escape of surplus water from said cylinders, and means for guiding the material to be pressed between said roll and the hot and pressure plates, substantially as described.

697,551. MACHINERY FOR THE MANUFACTURE OF LINOLEUM. CHARLES H. SMYTH, Gloucester, England. Filed May 1, 1901. Serial No. 64,361. (No model.)

Claim.—1. In apparatus for the manufacture of linoleum, the combination of a die, means for supplying linoleum mixture thereto, a transverse discharge-passage in communication with said die, and means for compressing the mixture within the die into a piece of the required size and shape and discharging it from said die into said passage, as set forth.

2. In apparatus for the manufacture of linoleum, the combination of a die, means for supplying linoleum mixture thereto, a transverse discharge-passage in communication with said die, means for supporting a traveling backing beneath said passage and means for compressing the material within the die into a piece of the required size and shape and discharging the compressed piece from the die into the discharge-passage and onto said backing, as set forth.

3. In apparatus for the manufacture of linoleum, the combination of a transverse row of dies, means for supplying linoleum mixture thereto, means for compressing the mixture within the dies into pieces of the required size and shape, a transverse discharge-passage in communication with said dies, and means for discharging the compressed pieces, as set forth.

4. In apparatus for the manufacture of linoleum, the combination of a number of transversely-arranged rows of dies, means for supplying linoleum mixture thereto, plungers therein adapted to compress the mixture into pieces of the required size and shape against transversely-movable plates that normally close said dies, means for withdrawing said plates and means for discharging the compressed pieces, as set forth.

5. In apparatus for the manufacture of linoleum, the combination of a series of dies, means for supplying linoleum mixture thereto, compressing-plungers therein, transverse discharge-passage communicating with the outlets from said dies, pressure-plates located in said discharge-passage and adapted to close the outlet ends of the dies, means for reciprocating said plungers at the required times and means adapted to move said pressure-plates clear of the outlets of the dies after part of the forward movement of the plungers has occurred, and to reversely move said pressure-plates after the plungers have completed their forward movements and then discharge the compressed mixture, substantially as described.

6. In apparatus for the manufacture of linoleum, the combination of a series of dies, means for supplying linoleum mixture thereto, compressing-plungers therein, transverse discharge-passage communicating with the outlets from said dies, pressure-plates located in said discharge-passage and adapted to close the outlet ends of the dies, a bar extending across the ends of said plungers, means for moving said bar toward and from said dies on abutment-plates opposite the outer end of each

plunger and carried by said bar and each capable of being separately moved into and out of engagement with its plunger, means adapted to move said pressure-plates at the required times, as set forth.

7. In apparatus for the manufacture of linoleum, the combination of a series of dies, means for supplying linoleum mixture thereto, a series of compressing-plungers, one in each die, means for reciprocating said plungers and pattern-controlling means whereby the reciprocating means of the several plungers are held in and out of their operative attitude in the required order, as set forth.

8. In apparatus for the manufacture of linoleum, the combination of a series of dies, means for supplying linoleum mixture thereto, a transverse discharge-passage in communication with said dies, plungers in said dies adapted to compress the mixture into pieces of the required size and shape, and a movable device having a surface of a particular contour adapted to control the reciprocating means of the several plungers, as set forth.

9. In apparatus for the manufacture of linoleum, the combination of a die-plate 13 having a series of grooves 14, hopper 15, plungers 17 having heads 17', transverse bar 19 with lip 19', means for moving said bar to and fro, abutment-plates 20, a movable device having perforations, pins or points 26 resting against said device, means connecting said pins or points 26 to said abutment-plates 20 and a link-bar 28, as set forth.

10. In apparatus for the manufacture of linoleum, the combination of a grooved die-plate 13, hopper 15, heated plate 16, plungers 17, transverse bar 19, links 20, levers 21, cam 22, abutment-plates 23, links 24, levers 26 having pins or points 26, perforated drum 27, means for moving said drum at the required times, and link-bar 28, as set forth.

11. In apparatus for the manufacture of linoleum, the combination of a series of dies, means for supplying linoleum mixture thereto, compressing-plungers therein, transverse discharge-passage communicating with the outlets from said dies, pressure-plates located in said discharge-passage and connected to bell-cranks, links connecting said bell-cranks to levers moved at the required times by cam, as set forth.

12. In apparatus for the manufacture of linoleum, the combination of a series of dies, means for supplying linoleum mixture thereto, compressing-plungers therein, transverse discharge-passage communicating with the outlets of said dies, means for supporting and intermittently moving a traveling backing beneath said discharge-passage and means for discharging the compressed pieces from said dies and discharge-passage onto said backing, as set forth.

697,552. MANUFACTURE OF LINOLEUM. CHARLES H. SMYTH, Gloucester, England. Filed July 24, 1902. Serial No. 63,912. (No model.)

Claim.—1. In the manufacture of linoleum, the combination with a support for linoleum, vertically-movable hollow dies for cutting out pieces of linoleum from a layer thereof on said support, and means for moving said support relatively to said dies, of an air-exhausting device connected to each die for the purpose of holding the piece of linoleum therein until the die is in position to apply it to the linoleum backing, and a plate in each die for then forcing its respective piece of linoleum out onto said backing, substantially as set forth.

2. In an apparatus for manufacturing linoleum, the combination with a support for loose granulated linoleum, one or more vertically-movable hollow dies for cutting portions of loose granulated linoleum from a layer thereof on said support, and means for moving said support and die or dies relatively to each other, of a plate within each die for compressing the portion of linoleum therein and constructed to pneumatically hold it therein until the die is in position to apply it to the linoleum backing, and means for forcing down each plate to deposit said portion upon the said backing, substantially as set forth.

3. In a machine for striking linoleum, the combination with a support for linoleum, vertically-movable dies adapted to cut out pieces of linoleum from a layer thereof on said support, and means for moving said support and dies relatively to each other, of plates fitting said dies and movable endwise therein, said plates being provided with air-exit openings so that a partial vacuum can be set up in the space between each plate and a piece of linoleum within the corresponding die, substantially as described for the purpose specified.

4. In a machine for making linoleum, the combination of dies adapted to cut out pieces of linoleum from a layer thereof, and plates fitting said dies and movable endwise therein, said plates being provided with air-exit openings controlled by one-way valves, substantially as described for the purpose specified.

5. In a machine for making linoleum, the combination of a table, a pressure-block arranged above said table and provided on its under side with dies, means for raising and lowering said block, plates fitting said dies air-tight and each formed with an air-exit opening through which air can pass from the under side of said plates, means for preventing the return of said air, means for raising and lowering said plates relatively to said dies, a plate serving to carry a layer of linoleum, means for moving said plate under said pressure-block and for withdrawing it therefrom, and means for feeding a backing below said pressure-block and plate.

6. In a machine for making linoleum, the combination of a table, a pressure-block arranged above said table and provided on its under side with dies, means for raising and lowering said block, plates fitting said dies air-tight and movable endwise therein, each plate being formed with an air-exit opening through which air can pass from the under side of said plates, a plate adapted to be moved under said pressure-block and to be withdrawn and serving to carry a layer of linoleum, means for feeding linoleum over said plate, and means for feeding a backing below said plate.

7. A machine for making linoleum comprising a table, two or more independent pressure-blocks provided on their under sides with dies, means for separately raising and lowering each of said blocks with dies, a plate arranged within each of said dies and fitted with an air-exit passage through which air can pass from the under side of said plates, means for preventing the return of said air to the under side of said plates, and means for raising and lowering said plates relatively to said dies, plates arranged horizontally above said table, means for moving each of said plates below its corresponding pressure-block and afterward withdrawing it, and means for feeding linoleum over each of said plates.

8. In a machine for making linoleum, the combination with a vertically-movable pressure-block provided on its under side with hollow dies, of plates fitted to slide air-tight within said dies, and having rounded or beveled lower edges, substantially as described for the purpose specified.

9. In a machine for making linoleum, the combination with a vertically-movable pressure-block provided on its under side with hollow dies, of plates arranged to slide air-tight within said dies and formed with air-exit passages through which air can pass from the under sides of said plates, means for preventing the return of said air, and means external to said dies for moving the plates endwise therein alternately in opposite directions, substantially as herein described for the purpose specified.

10. In a machine for making linoleum, the combination of a pressure-block provided on its under side with hollow dies, a vertically-movable cross-piece to which said pressure-block is connected so as to be capable of rising and falling relatively thereto, springs tending to force said pressure-block and cross-piece apart, plates fitting said dies and having their ends extending through said block and adapted to be depressed by said cross-piece and plates being formed with air-exit passages through which air can pass from the under side of said plates, means for preventing the return of said air, means for raising and lowering said cross-piece, a plate adapted to support a layer of linoleum below said pressure-block,

means for moving said plate below said pressure-block, means for withdrawing it, and means for feeding a backing below said pressure-block.

11. In a machine for making insid linoleum, the combination of a pressure-block provided on its under side with hollow dies, a vertically-movable cross-piece to which said pressure-block is connected as to be capable of rising and falling relatively thereto, springs tending to force said pressure-block and cross-piece apart, pistons fitting said dies and having their rods extending through said blocks and adapted to be depressed by said cross-piece, said pistons being formed with air-exit passages through which air can pass from the under side of said pistons, means for preventing the return of said air, means for raising and lowering said cross-piece, a plate adapted to support a layer of linoleum below said pressure-block, means for moving said plate below said pressure-block and withdrawing it, means for automatically feeding a layer of linoleum over said plate, and means for feeding a backing below said plate.

12. A machine for making insid linoleum comprising a table, two or more combined pressure-blocks and cross-pieces arranged independently of each other above said table, each of said pressure-blocks being provided on its under side with hollow dies, with pistons fitting said dies and having their rods bear against the corresponding cross-pieces, and springs tending to force said block away from the corresponding cross-piece and permitting the latter to move toward and away from said block when downward movement thereof is arrested, said pistons being formed with air-exit passages through which air can pass from the under side of said pistons, means for preventing the return of said air, mechanism for raising and lowering each of said cross-pieces independently of each other, horizontal plates arranged above said table, means for reciprocating said plates below said pressure-blocks, and stationary tiring-boxes each adapted to deposit a layer of granulated linoleum over its corresponding plate when the same is moved under it in one direction, substantially as described.

697,558. MILK-CAN. BENJAMIN G. BRAMAN, New York, N. Y. Original application filed Jan. 30, 1901, Serial No. 45,303. Divided and this application filed Dec. 7, 1901. Serial No. 84,904. (No model.)

Claim.—1. A milk-can having a breast member and a bowl member, the breast member and bowl member being each formed of a single thickness of metal and each provided with a rigid integral neck member, said neck members overlapping throughout substantially their entire extent to form a double neck, the inner neck member stopping short of overlapping the outer neck member, the inner neck member having its free edge chamfered or beveled in order to avoid the formation of a recess liable to hold impurities.

2. A milk-can having a breast member and a bowl member, the breast member being formed of a single thickness of metal and provided with a rigid integral neck member, the bowl member also having a neck member, said members overlapping throughout substantially their entire extent to form a double neck, the inner neck member having its free edge chamfered or beveled in order to avoid the formation of a recess liable to hold impurities, the other neck member having a bent portion engaging the other part of the can.

697,554. APPARATUS FOR HEATING OR COOLING LIQUIDS. EDWARD GILLER, Düsseldorf, Germany. Filed Apr. 24, 1900. Serial No. 14,667. (No model.)

Claim.—An apparatus for heating and cooling liquids, composed of a pair of oppositely-arranged communicating channel channels, a pair of

inner communicating heating or cooling chambers intermediate said channels, a series of outer heating or cooling chambers that inclose the channels and the inner chambers, the adjoining outer heating or cooling chambers being connected alternately at the top and bottom, substantially as specified.

697,555. MIXER OR VAPORIZER FOR HYDROCARBON-ENGINE. CHAS. EDWARD SUTHERLAND, Chicago, Ill. Filed Mar. 13, 1901. Serial No. 51,671. (No model.)

Claim.—1. A mixer or vaporizer for hydrocarbon-engines consisting of a chamber through which the air passes on its way to the cylinder, a pump-casing opening into the chamber, a hollow plunger working in the casing and ending, an oil-inlet valve in that part of the plunger within the casing, and a discharge-port in the plunger adapted to open into the chamber during a portion of the stroke of the plunger and to be closed during the remainder of the stroke by passing within the casing.

2. A means of supplying oil to hydrocarbon-engines consisting of a pump-casing, supply and overflow pipes connected thereto, valves in said pipes, a plunger in the casing, a chamber in the plunger, said chamber having an inlet-valve opening under less pressure than the valve of the overflow-pipe and a discharge-port closed by the casing during a portion of the stroke.

3. A mixer or vaporizer for hydrocarbon-engines consisting of a mixing-chamber in the air-passage leading to the cylinder, a pump-casing opening into the mixing-chamber, a chambered plunger working within the casing and the mixing-chamber, an oil-inlet valve in the plunger, an oil-discharge port in the plunger adapted to alternately open and close by passing without and within the casing, and means to regulate the amount of oil discharged through said port.

4. A mixer or vaporizer for hydrocarbon-engines, consisting of a mixing-chamber, a pump adjacent thereto having a plunger working partly within the chamber, an oil-passage in the plunger having a port opening into the chamber, a sliding block in the passage to regulate the size of the port, and means to adjust the block.

697,556. WHIRLETYPE-COUPLINE. JOHN C. BRADLEY, Fairmont, W. Va. Filed July 12, 1901. Serial No. 68,964. (No model.)

Claim.—1. The combination with a draft-pin, a relatively fixed whirleytype, and a pivot-rod pivoting these parts, of a brace having one end connected to the pivot-pin, a laterally-projected support carried by

the pole and located at the opposite end of the brace, a pivotal connection between the support and the brace.

2. The combination with a draft-pole, a relatively fixed whiffletree and a pivot-bolt piercing these parts, of a laterally-directed projection carried by the pole, a brace having its opposite ends connected, respectively, to the projection and the pivot-pin, and an inclined brace having its opposite ends connected with the pole and projection and extended away from the first-mentioned brace.

3. The combination with a draft-pole, a relatively fixed whiffletree, and a pivot-pin piercing these parts, of a laterally-directed and bifurcated projection carried by the pole, a substantially horizontal brace having one end provided with an opening receiving the pivot-pin, and its opposite end provided with a reduced perforated bearing-ear which is received within the bifurcation of the projection, a forked inclined brace having one end connected to the pole and its forked members embracing the projection, and a pivot-pin piercing the forked members, the projection and the bearing-ear of the first-mentioned brace.

4. A whiffletree-brace embodying a support constructed for application to a draft-pole, a whiffletree-brace having one end pivotally connected to the support and its opposite end provided with a perforation for the reception of the pivot-pin of a whiffletree, and an inclined brace having one end connected to the support and located opposite the whiffletree-brace, the outer end of the inclined brace having means for connection with a draft-pole.

5. A whiffletree-brace embodying an attaching-bracket, having a laterally-directed projection, which is bifurcated longitudinally, a whiffletree-brace having one end provided with a perforate bearing-ear mounted within the bifurcation of the projection, and its opposite end provided with a perforation for the reception of a whiffletree-pin, and an inclined brace located opposite the whiffletree-brace and having its outer end connected to the bracket, the opposite end of said brace being bifurcated to straddle the projection, and a pivot-pin piercing the forked portion of the inclined brace, the projection and the bearing-ear of the whiffletree-brace.

697,557. GRAIN-CAR DOOR. GEORGE S. SMITH, DART, N.H., assigner of one-half to WILLIAM S. LEWIS, DART, N.H. Filed Nov. 30, 1901. Serial No. 84,388. (No model.)

Claim.—1. The combination with a grain-car door provided at its bottom with an opening and having ways at opposite sides thereof, of a sliding supplemental door arranged in the ways and adapted to cover and uncover the opening, and the vertical rods mounted on the car-door and adapted to detachably engage the bottom of the car and preventing the said door from springing outward, substantially as described.

2. The combination of a grain-car door having an opening at its bottom and provided at opposite sides with ways, a supplemental door mounted in the said ways and provided with central guides, and the vertical rods secured at their upper ends to the car-door and extending through the said guides and detachably engaging the bottom of the car, substantially as described.

3. The combination of a car-door having an opening at its bottom, the metal strips secured to the door and provided with L-shaped flanges forming vertical ways and having arms at their upper and lower ends, said arms being secured to the door, and a supplemental door mounted in the ways and adapted to cover and uncover the said opening, substantially as described.

4. The combination of a door having a bottom opening and provided above the same with a horizontal cleat, the metal strips secured to the car-door at opposite sides thereof and provided with vertical L-shaped flanges forming ways and having upper and lower arms, the upper arm being secured to the cleat and the lower arm being fastened to the car-door at the back thereof, the supplemental door mounted in the ways and provided with guides, and the vertical rods secured to the cleat and passing through the guides of the supplemental door, substantially as described.

697,558. PRINTING-PRESS. WILLIAM SWANENBERG, Brooklyn, N. Y., assigner, by direct and mesne assignments, to Robert E. E. and Charles W. Carpenter, copartners as R. E. E. and Company, New York, N. Y. Filed Dec. 31, 1897. Serial No. 688,082. (No model.)

Claim.—1. In a printing-press, the combination of two printing and perfecting mechanisms, each of said mechanisms comprising a pair of printing-couplers, the two couplers of each printing and perfecting mechanism being arranged one above the other and the four printing-couplers being arranged in radii from a common center, the impression-cylinders of each couple being placed nearest the center and the inking mechanism for each couple being placed furthest from the center in the case of each printing mechanism, all of the printing mechanisms being arranged in line and with their cylinders parallel, and means whereby a single web may be led through both said mechanisms for color-printing, or separate webs may be led through said mechanisms for printing and perfecting a plurality of webs, substantially as described.

2. In a printing-press, the combination of two printing and perfecting mechanisms, each of said mechanisms comprising a pair of printing-couplers, the four printing-couplers being arranged in radii from a common center, the impression-cylinders of each couple being placed nearest the center and the inking mechanism for each couple being placed furthest from the center in the case of each printing mechanism, all of said mechanisms being arranged in line with their cylinders parallel, means whereby a single web may be led through both said mechanisms for color-printing, or separate webs may be led through said mechanisms for printing and perfecting a plurality of webs, and a fifth printing mechanism arranged to coast with said two web printing and perfecting mechanisms in color-printing, substantially as described.

3. The combination of two printing and perfecting mechanisms consisting of a pair of printing-couplers arranged in radii from a common center, the impression-cylinders of each couple being placed nearest the center and the inking mechanism for each couple being placed furthest from the center in the case of each printing mechanism, all of said printing mechanisms being arranged in line with their cylinders parallel, means whereby a single web may be led through both said mechanisms for color-printing, or separate webs may be led through said mechanisms for printing and perfecting a plurality of webs, and a third printing mechanism placed in the V-shaped space above the center of the press and arranged to coast with said two web printing and perfecting mechanisms in color-printing, substantially as described.

4. The combination with a plurality of web-printing mechanisms arranged in line with their cylinders parallel, of two folding and delivery mechanisms having longitudinal folders arranged in line with and between said printing mechanisms, with the folders facing in opposite directions and toward each other, and means for guiding the web from the respective mechanisms to either of the folders, substantially as described.

5. The combination with a plurality of web-printing mechanisms at each end of the press, arranged in line with their cylinders parallel and with the printing and perfecting mechanisms at the same end of the press arranged side by side with their printing-couples radiating from a common center, of two folding and delivery mechanisms arranged in line with and between the printing mechanisms at the opposite ends of the press, substantially as described.

6. In a printing-press, the combination with a plurality of web-printing and perfecting mechanisms at each end of the press arranged in line with their cylinders parallel and with the printing and perfecting mechanisms at the same end of the press arranged side by side, of folding and delivery mechanisms arranged in line with and between the printing mechanisms at the opposite ends of the press, substantially as described.

7. In a printing-press, the combination with a plurality of web-printing and perfecting mechanisms at each end of the press arranged in line with their cylinders parallel and with the printing and perfecting mechanisms at the same end of the press arranged side by side, of two folding and delivery mechanisms arranged in line with and between the printing mechanisms at the opposite ends of the press, substantially as described.

8. In a printing-press, the combination with a plurality of web-printing and perfecting mechanisms at each end of the press arranged in line with their cylinders parallel and with the printing and perfecting mechanisms at the same end of the press arranged side by side, of two folding and delivery mechanisms arranged in line with and between the printing mechanisms at the opposite ends of the press and having longitudinal folders facing in opposite directions and toward each other, substantially as described.

9. In a printing-press, the combination with a plurality of web-printing and perfecting mechanisms at each end of the press arranged in line with their cylinders parallel and with the printing and perfecting mechanisms at the same end of the press arranged side by side with their printing-couples radiating from a common center, of two folding and delivery mechanisms arranged in line with and between the printing mechanisms at the opposite ends of the press, and having longitudinal folders facing in opposite directions and toward each other, substantially as described.

10. In a printing-press, the combination with a plurality of web-printing and perfecting mechanisms at each end of the press arranged in line with their cylinders parallel and with the printing and perfecting mechanisms at the same end of the press arranged side by side of two folding and delivery mechanisms arranged between the printing and perfecting mechanisms at the opposite ends of the press, and means for guiding the webs from the respective mechanisms to either of the folders, substantially as described.

11. In a printing-press, the combination with a plurality of web-printing and perfecting mechanisms at each end of the press arranged in line with their cylinders parallel and with the printing and perfecting mechanisms at the same end of the press arranged side by side, of two folding and delivery mechanisms arranged between the printing mechanisms at the opposite ends of the press, and having longitudinal folders facing in opposite directions and toward each other, and means for guiding the webs from the respective mechanisms to either of the folders, substantially as described.

12. In a printing-press, the combination with a plurality of web-printing and perfecting mechanisms at each end of the press arranged in line with their cylinders parallel and with the printing and perfecting mechanisms at the same end of the press arranged side by side, of two folding and delivery mechanisms arranged in line with and between the printing and perfecting mechanisms at the opposite ends of the press, and means for guiding the webs from the upper type-cylinders of the respective printing and perfecting mechanisms to the folders, with space between the upper and lower webs for access to the upper type-cylinders and inking mechanisms of the two inside printing and perfecting mechanisms, substantially as described.

13. The combination with a plurality of web-printing and perfecting mechanisms at each end of the press arranged in line with their cylinders parallel, of two folding and delivery mechanisms each arranged in line with and between said web-printing and perfecting mechanisms with the front side of the folding and delivery mechanisms facing in opposite directions and toward each other, substantially as described.

697,559. STOCK-RINGER. ANTHONY J. BRUNER, Kansas City, Mo. Filed May 17, 1901. Serial No. 68,705. (No model.)

Claim.—1. The combination substantially as described of oppositely-disposed pivotally-connected jaws, a stock upon which said jaws are mounted, a spring mounted in said stock, a latch connected with said spring, a trigger adapted to engage said latch to hold the spring under tension, a stop on said latch for effecting the engagement of said latch with the trigger, a leg upon one of said jaws provided with a catch adapted to engage said latch and a projection on said leg adapted to engage said latch and release the catch therefrom, as the jaws are closed.

2. In a stock-ringer, the combination of a stock, oppositely-disposed, pivotally-connected jaws mounted upon said stock, a spring mounted in said stock, a retained latch connected with said spring, a trigger mounted in said stock and arranged to engage said recess in said latch to hold said spring under tension, and a catch on one side of said jaws arranged to be brought into engagement with said latch to set said jaw upon the ring after the spring is set; substantially as set forth.

3. In a stock-ringer the combination of a stock, oppositely-disposed, pivotally-connected jaws on said stock, a spring mounted in said stock, a latch connected with said spring and arranged to be engaged by one of said jaws, a trigger mounted in said stock and arranged to engage said latch to hold the spring under tension, a pole upon which said stock is mounted, and a wire extending along said pole and connected with said trigger for releasing the same from said latch; substantially as set forth.

697,560. TUBULAR BOILER. JAMES A. STEVENS, Philadelphia, Pa. Filed Mar. 26, 1901. Serial No. 68,904. (No model.)

Claim.—1. A boiler comprising a drum, and fire-tubes having their ends expanded and welded together in line of a crown-sheet, substantially as specified.

2. A boiler comprising a drum, fire-tubes having expanded ends fitted and connected together so as to form a crown, and a band connecting said drum and tubes, substantially as specified.

697,561. STEAM-BOILER. JAMES A. STEVENS, Barberton, Ohio. Filed Oct. 3, 1901. Serial No. 73,004. (No model.)

Claim.—1. A water-tube boiler having a plurality of banks of tubes, the tubes forming the rear portions of one or more of the banks being arranged closely together and forming a baffle-plate.

2. A water-tube boiler comprising a plurality of upper drums having communication with each other, a lower mud-drum, a plurality of banks of tubes extending between the mud-drum and the upper drums, the tubes forming the rear wall of the first bank being arranged closely together for a portion of their length and forming a baffle-plate, and thence being separated for the remainder of their length, alternate tubes being connected to different drums.

3. A steam-boiler having as elements, a pair of connected upper drums 7 and 8, a lower mud-drum 10, a bank of tubes 20 extending from the mud drum to the drum 7 at a point adjacent to the combustion-chamber, a second bank of tubes 18 extending between the mud-drum and the second upper drum 8, and an auxiliary set of tubes 21 alternating with the tubes 20 forming the rear row of the first bank, the said tubes of the rear row and the tubes 21 being arranged closely together for a portion of their length to form a baffle-plate and thence being separated for the remainder of their length, the tubes 20 continuing with those of the first bank to the drum 7 and the said tubes 21 being connected to the drum 8, substantially as specified.

4. The combination in a water-tube boiler, of a series of upper drums

6, 7 and 8, having communication with each other, two lower drums 9 and 10 also in communication with each other, a bank of water-tubes 17 extending between the drums 6 and 8, a crossed bank of tubes 18 extending between the drums 8 and 10, a third bank of tubes 19 extending between the drums 7 and 10, an auxiliary row of tubes 21 arranged in alternation with the rear row of tubes in the bank 19 and being arranged closely together for a portion of their length to form a baffie-plate, said tubes 21 being separated from the tubes 19 near their upper ends and being connected to the drum 8, an auxiliary row of tubes 23 arranged in alternation with the rear row of tubes and the bank 18 and being arranged closely together for a portion of their length, said tubes 23 being separated from the tubes 18 near their lower ends and being connected to the rear end-drum 2, substantially as specified.

5. In combination in a water-tube boiler, of a plurality of upper drums, a rear-drum, tubes connecting the rear-drum to the upper drums, an auxiliary set of transversely-disposed tubes arranged closely together and forming a baffie-plate or deflector, and drums or manifolds 26 and 27 to which the opposite ends of said auxiliary tubes are connected, and connections between one of said drums and the rear-drum and between the opposite side drums and one of the upper drums, substantially as specified.

697,562. PICKER-CHECK FOR LOCKER. CHARLES A. DE GREE, Dover, Mo. Filed Dec. 5, 1891. Serial No. 84,384. (No model.)

Claim.—1. In a device of the class described, the combination with a support, of a holding-plate movably mounted on the support, a flexible check-strap secured to the holding-plate, and a tension-spring engaging the holding-plate.

2. In a device of the class described, the combination with a support, of a holding-plate movably mounted on the support, a flexible check-strap secured to the holding-plate, a tension-spring engaging the holding-plate, and means for regulating the tension of the spring.

3. In a device of the class described, the combination with a support, of a holding device pivoted upon the support, a flexible check-strap

connected to the holding device, and a tension-spring engaging the holding device.

4. In a device of the class described, the combination with a support, of a holding device pivoted upon the support, a flexible check-strap connected to the holding device, a tension-spring engaging the holding device, and mechanism for regulating the tension of the spring.

5. In a device of the class described, the combination with a support, of a holding device pivoted to the support at one end, a flexible check-strap secured to the free end of the holding device, and a tension-spring mounted upon the support and bearing against the holding device.

6. In a device of the class described, the combination with a support, of a holding device pivoted to one end of the support, a flexible check-strap secured to the opposite end of the support at one end and attached at its opposite end to the holding device, and a tension-spring engaging the holding device.

7. In a device of the class described, the combination with a support, of a holding-plate pivoted to the support at one end, a flexible check-strap secured to the free end of the holding-plate, a tension-spring engaging the holding-plate between its pivot and the point of attachment, and means for regulating the tension of the spring.

8. In a device of the class described the combination with a support, of a holding-plate pivoted to one end of the support, a flexible check-strap secured to the opposite end of the support and attached to the holding-plate, a tension-spring engaging the holding-plate between its pivot and the point of attachment of the check-strap, an adjusting-screw passing through the spring, and a nut threaded on the screw and engaging said spring.

697,563. THRASHING-MACHINE. PHILIP P. CURTIS, Lowell, Ind. Filed Sept. 4, 1899. Serial No. 28,908. (No model.)

Claim.—In combination, a thrashing-machine having a reciprocating ridge-chase, a roller-chase secured to the side of the thrashing-machine, a reciprocating ridge-chase in each case, a bracket secured to the ridge-chase of the thrashing-machine, and a link connecting the bracket with the roller ridge-chase and being pivotally attached to each.

697,564. PNEUMATIC TIRE. CHARLES E. THOMAS, Tucson, Ariz. Filed Sept. 28, 1891. Serial No. 78,351. (No model.)

Claim.—1. A tire embodying a series of tubes, each with a valve, and a pouch common to all of said valves and tubes, said pouch including the ends of the tubes, and induced by the tire.

2. A tire of the character described, embodying a series of tubes, an inflating-valve for one end of each tube and a flexible pouch including said valves and stems, said pouch provided with an inflating-valve and induced by the tire.

3. A tire embodying a series of tubes each provided with a valve at one end, said tubes and valves inclosed by an inflating-pouch which is inclosed by the tire and means on the valves within the pouch permitting of deflation of the tubes.

4. In a tire of the character described, a series of tubes and a series of valves each provided with a projecting stem, and a pouch inclosing said tubes and valves, said pouch inclosed by the tire.

5. In a tire a plurality of tubes closed at one end, a valve in the other end of each of said tubes, a stem projecting from each of said valves, and a flexible pouch embracing the said valved ends of the tubes and the stems and secured to the said ends, as set forth.

697,565. GUARD FOR GANG-EDGER. EDWIN E. THOMAS, St. Paul, Minn., assignor of one-half to Union Iron Works, Minneapolis, Minn., a Corporation of Minnesota. Filed Oct. 12, 1901. Serial No. 78,410. (No model.)

Claim.—1. The combination, with the feed-rolls, of swinging pawls arranged in groups above the same, each group being composed of two or more pawls of different length, the pawls of each group being substantially the same length as the corresponding pawls of the other groups and those of the same length in the different groups being adapted to engage the upper surface of the lumber of the thickness for which they are appropriate and prevent backward movement of the same.

2. The combination, with a gang-edger and its feed-rolls, of swinging pawls provided above and below the level of said rolls and adapted to engage respectively the upper and lower surfaces of the lumber and prevent backward movement of the same while it is passing through the edger.

3. The combination, with a gang-edger and its feed-rolls, of swinging pawls arranged in groups above the level of the same, each group being composed of two or more pawls of different length, those of the same length in the different groups being adapted to engage the upper surface of the lumber of the thickness for which they are appropriate and prevent backward movement of the same, and swinging pawls provided below the level of said rolls and adapted to engage the under surface of the lumber.

4. The combination, with a gang-edger and its feed-rolls, of means above and below the level of said rolls between which the lumber passes and is engaged and held against backward movement.

5. The combination, with a gang-edger and its feed-rolls of oscillating means above and below the level thereof and between which the lumber passes and is locked and held against vertical and backward movement.

6. The combination, with a gang-edger feed-table and the rolls thereon of standards provided on said table, rods connecting said standards, and a series of pawls pivotally supported between said standards, said

pawls being arranged in groups and each group being composed of pawls of different length, those of the same length in the different groups being adapted to engage the upper surface of the lumber of the thickness for which they are appropriate and prevent backward movement of the same, substantially as described.

7. The combination, with a gang-edger feed-table and the feed-rolls, of standards secured on said table, rods connecting said standards, a series of pawls pivotally supported between said standards, said pawls being arranged in groups and each group being composed of pawls of different length, the corresponding pawls of the several groups being of the same length, and a series of swinging pawls provided below the level of said rolls and adapted to engage the under surface of the lumber, substantially as described.

697,566. COMPOSITION FOR PRESERVING FRUITS. JAMES E. THOMAS, Payson, Wash. Filed Mar. 20, 1901. Serial No. 58,700. (No specimens.)

Claim.—A composition of matter for preserving fruits and vegetables, composed of slaked lime, ordinary hard-plaster, and wheat-middlings, thoroughly mixed together and in a dry condition, substantially in the proportions described.

697,567. HYDRO-PNEUMATIC RENOVATOR. JOHN S. THOMAS, St. Louis, Mo. Filed June 22, 1901. Serial No. 66,722. (No model.)

Claim.—1. In an apparatus of the character described, the combination with a curtain-wall, of means for projecting liquid against the front face thereof, substantially as described.

2. In an apparatus of the character described, the combination with a curtain-wall, of end walls, and means for projecting liquid against the front face of said curtain-wall, substantially as described.

3. In an apparatus of the character described, the combination with a receptacle, of a curtain-wall extending thereabove, end walls coincident in height with the curtain-wall, and means for projecting liquid against the front face of the curtain-wall, substantially as described.

4. In an apparatus of the character described, the combination with a receptacle whose end walls are projected upwardly, of curtain-walls located centrally with respect to said receptacle and extending from end wall to end wall to the top thereof, the upper ends of said curtain-walls being curved outwardly, and means for projecting liquid from the top edges of said curtain-walls downwardly in front thereof, substantially as described.

5. In an apparatus of the character described, the combination with a receptacle containing a liquid, of a curtain-wall, a nozzle entering said receptacle below the line of the level of the liquid therein, a pressure-supply pipe connected to said nozzle, and a pipe for receiving liquid injected therewith by the blast from said nozzle, said pipe leading to the upper edge of the curtain-wall where it is provided with a discharge for directing the liquid in front of the curtain-wall and into the receptacle, substantially as described.

6. In an apparatus of the character described, the combination with a receptacle containing a liquid, of a curtain-wall, a pipe leading from said receptacle to the upper edge of the curtain-wall, the upper end of said pipe being flared with a discharge for directing liquid downwardly in front of the curtain-wall and into said receptacle, and means for forcing the liquid from said receptacle up into and through said pipe, substantially as described.

7. In an apparatus of the character described, the combination with a receptacle, of a curtain-wall, a nozzle entering said receptacle below the

line of the level of the liquid contained therein, a pipe in line with said nozzle for receiving liquid forced thereto by a blast emanating from said nozzle, said pipe extending to the upper edge of the contain-wall where it discharges said liquid, and a screen around the nozzle, substantially as described.

11. An apparatus for collecting and precipitating dust from air comprising a housing open at one side, the back wall of said housing having a sheet of water constantly traversing the same, substantially as described.

697,568. LOCK. JOHN J. TUNER, New Britain, Conn. Filed July 31, 1901. Serial No. 70,361. (No model.)

Claim.—1. A lock mechanism operating as and for the purposes specified, said mechanism comprising the casing, the spring-actuated bolt provided with a stump, the tumblers arranged one above the other, and the latch-plate located between the tumblers and the lock-bolt and adapted in one of its positions to maintain the tumblers in such a position that their notches shall register with one another and lie in the path of movement of the stump, substantially as described.

2. A lock mechanism operating as and for the purposes specified, said mechanism comprising the casing, the spring-actuated lock-bolt, the tumblers arranged one above the other, the latch-plate located between the tumblers and the bolt, notches in the tumblers and oppositely-disposed notches in the latch-plate, the stump on the bolt engaging with the notches in the tumblers and in the latch-plate, substantially as described.

3. A lock adapted to operate alternately as a positive and as a spring lock, comprising the casing, the lock-bolt, the tumblers arranged one above the other, and the latch-plate located between the tumblers and the bolt, the parts being so constructed and arranged that the lock is changed from a positive to a spring lock by means of the key, and is changed from a spring lock to a positive lock automatically by the movement of the bolt.

4. The combination in a lock with the casing, the tumblers, and the spring-actuated lock-bolt provided with a stump, of the latch-plate located between the tumblers and the lock-bolt, said latch-plate having notches of different depths, the parts being so constructed and arranged that the lock is changed from a positive lock to a spring-lock when the bolt is retracted by means of a key, and changed from a spring-lock to a positive lock automatically when the bolt is retracted, substantially as described.

5. The combination in a lock with the casing, the pivoted tumblers and the bolt, of the latch-plate pivotally mounted and having a limited longitudinal movement, the latch-plate being so constructed and arranged that on one extreme position it permits the stump of the bolt to move entirely out of the notches in the tumblers, and that in its opposite extreme position it prevents the stump on the bolt from moving out of the notches in the tumblers.

6. The combination with a lock and with the casing, the pivoted tumblers spring-actuated in one direction, slots in said tumblers, the sliding bolt and the stump carried by said bolt, of a pivotally-mounted latch-plate spring-actuated in one direction and capable of limited longitudinal movement, and notches of different depths in said latch-plate, as and for the purposes specified.

7. A lock mechanism comprising a bolt, a plurality of pivoted tumblers located one above the other, and a latch-plate located between the tumblers and the bolt, said mechanism being adapted to operate alternately, first as a positive and then as a spring lock, the change from the spring-lock to the positive lock being accomplished automatically by the movement of the bolt.

697,569. RAIL-JOINT. BLANCHARD E. TERRY, Havana, Iowa, assignor of one-half to Francis E. Turner and Benjamin B. Smith, Havana, Iowa. Filed Dec. 26, 1901. Serial No. 67,315. (No model.)

Claim.—1. A device of the class described comprising the oppositely-converging inner and outer trans-plates designed to be arranged at opposite sides of a rail, and a bottom support having downwardly-converging sides, substantially as described.

2. A rail-joint lock comprising inner and outer trans-braces adapted to engage rail ends at their head and bottom flanges, and a double trans-brace adapted to be connected with the lower edges of said braces.

3. A rail-joint lock comprising inner and outer trans-braces adapted

to engage rail ends on their opposite sides, said braces being adapted to extend up on each side of a rail even with the top thereof, and a bottom support connected with said braces.

4. The combination with the rails, of a bottom-supporting brace, trans-braces provided with flanges for engaging the edges of said bottom brace and the edges of the rail-flanges, said trans-braces being provided with means for engaging the rail-heads, and means for fastening said parts together.

5. The combination with the rails and fish-plates, of a double trans-supporting bottom brace adapted to extend under said rails, and means for connecting said rails, fish-plates and bottom brace.

6. The combination with the rails, of a double trans bottom brace having the edges thereof extended flush with the edges of the bottom rail-flanges, and side braces adapted to engage the edges of said flanges and brace and hold them together, said braces having means at their upper end for engaging the rail-heads, and means for holding said parts firmly together.

7. The combination of rail ends disposed adjacent to each other and provided with recesses on one side thereof, a bottom support for said rail ends, and a trans-brace having an extended lip adapted to engage said recesses.

697,570. SPRING-GEAR FOR VEHICLES. DAVID TOWN, Amesbury, Mass. Filed Oct. 2, 1902. Serial No. 31,772. (No model.)

Claim.—1. In a spring-gear for vehicles, a frame above the axle for supporting the carriage-body; a pair of rotative rods or shafts supported by and having their bearings in said frame; mechanism connecting said rods or shafts whereby the rotation of one imparts rotation to the other; load-supporting springs intermediate with and connected with said rods or shafts; and neutralizing or compensating springs connecting said rods or shafts with the frame, substantially as described.

2. In a spring-gear for vehicles, the frame above the axle for supporting the carriage-body; the rotative rods or shafts D, D' supported by and having their bearings in the frame; mechanism intermediate with said rods or shafts whereby rotation of one imparts similar rotation to the other; the substantially radial hooks or catches J, J', the former rigidly secured to and extending upward from the rod D', and the latter rigidly secured to and extending downward from the rod D; and springs intermediate with said rotative rods and each having one end connected with one of the upwardly-extending hooks J, and the other end connected with one of the downwardly-extending hooks J', substantially as set forth.

697,571. TEMPORARY BINDER. EMORY A. TRIMBLE, St. Louis, Mo., assignor to the Huber & Trumbull Manufacturing Company, St. Louis, Mo., a Corporation. Filed Jan. 14, 1901. Serial No. 68,148. (No model.)

Claim.—1. In a temporary binder, the combination of a pair of cover-boards, flaps applied to the cover-boards and extending across the back of the binder and serving as back members, a flexible reinforcing-stay interposed between said flaps at the binder-back and having its ends inserted within said cover-boards and attached to said boards independently of said flaps, and sheet-holding means attached to the binder-back, substantially as described.

2. In a temporary binder, the combination of a pair of cover-boards, flaps applied to said cover-boards and extending across the back of the binder and serving as back members, a flexible reinforcing-stay interposed between said flaps at the binder-back and having its ends inserted within said cover-boards and attached to said boards independently of said flaps, and a stiffening member located between one of said flaps and said flexible reinforcing-stay, substantially as described.

3. In a temporary binder, the combination of cover-boards, inner and outer flaps applied to said boards, said flaps connecting said boards at their rear edges and serving as members of the back of the binder, a stay interposed between said flaps and having its ends secured to said cover-boards, a frame composed of two bars hinged together, sheet-holding prongs carried by said frame, clamping-strips arranged against said stay, and means for connecting said frame and said clamping-strips to clamp said stay and said inner flaps, substantially as described.

697,572. TROLLEY-HARP. THOMAS H. TURNER and GEORGE R. WILSON, Springfield, Ohio, assignors of three-fifths to J. E. Cooper, L. F. Young, and J. M. Todd, Springfield, Ohio. Filed Sept. 11, 1901. Serial No. 75,001. (No model.)

Claim.—1. In a trolley-harp the combination of a fixed bracket, a movable wheel-frame pivoted thereto a wheel mounted in said frame to the rear of the pivot, and the antifriction-wheel 2, operating between the pivot-frame and the fixed bracket at the point of engagement between the frame and bracket which is nearest to the axis of the trolley-wheel.

2. The combination of a fixed bracket adapted to be secured to the trolley-pole, a trolley-wheel frame pivotally secured to the bracket forward the axis of the trolley-wheel and antifriction means interposed between the bracket and the movable wheel-frame approximate the point of greatest pressure when the device is in normal position, substantially as described.

3. In combination with a cored-out bracket fixed to a trolley-pole, a movable wheel-frame pivoted to the bracket forward the axis of the trolley-wheel, a lag on the under side of the movable frame projecting into the cored-out part of the bracket and spring means operating between the lag and the fixed bracket for maintaining the normal position of the wheel-frame with respect to the bracket.

4. In combination with a cored-out bracket fixed to a trolley-pole, a movable wheel-frame pivoted to the bracket forward the axis of the trolley-wheel, a lag on the under side of the movable frame projecting into the cored-out part of the bracket and spring means operating between the lag and the fixed bracket for maintaining the normal position of the wheel-frame with respect to the bracket with antifriction-wheel operating between the rear of the bracket and the wheel-frame.

5. The combination of a trolley-pole, a bracket recessed at its upper rear extension having a shoulder with an arc-shaped edge, a wheel-frame

having an arc-shaped front edge conforming to the arc-shaped edge of the shoulder and pivotally secured to the bracket at a point concentric to its arc-shaped edge.

6. The combination of a trolley-bracket having a cored-out rear horizontal extension, a wheel-frame pivotally secured thereto having a lag upon its under side extending into and movable in the cored-out part of the bracket with springs secured to the fixed bracket and adapted to co-operate with the lag for maintaining the normal position of the wheel-frame, substantially as described.

697,573. MOTION-TRANSMITTER. ROBERT TUTTLE, Cedar Rapids, Iowa. Filed June 20, 1901. Serial No. 68,474. (No model.)

Claim.—1. In a motion-transmitter, the combination with a rotating shaft, of a pair of gears loosely mounted thereon, a driver, secured to said gears, annular gears of different diameters adapted to engage said gears, means for alternately holding the annular gears from revolving axially, and means for imparting an orbital movement to said annular gears and causing a revolution at a different rate of speed of the engaging gears.

2. The combination with a rotating shaft, of a plurality of driving-gears loosely mounted thereon, annular gears of different diameters mounted to mesh therewith, and having each a radial arm projecting beyond the path of said annular gear, and a sliding stop adapted to be moved in or out of the path of said arm, and alternately prevent the axial turning of the annular gears, and eccentric flat to said shaft, on which the annular gears are mounted, substantially as and for the purpose set forth.

3. The combination with a rotating shaft, internal gears mounted revolvably thereon, eccentric flat to said shaft, and annular gears mounted revolvably on said eccentrics and adapted to engage the internal gears at their longer radii, with arms extending beyond the paths of said gears, of intercepting-stops to hold said arms, with antifriction-rollers thereon to take the reciprocating movement of the arms.

4. The combination of a rotating shaft, internal driving-gears mounted revolvably thereon, eccentrics secured to said shaft, annular gears mounted on said eccentrics and partially meshing with the internal gears, and means for preventing the annular gears from turning, of a second shaft carrying a friction-clutch adapted to connect the driving mechanism of both shafts intermittently, substantially as described.

697,574. GAME. FRANK WALSH, North Tarrytown, N. Y. Filed Nov. 20, 1901. Serial No. 64,087. (No model.)

Claim.—1. A game-board consisting of a flat table with a plurality of flexible and elastic pillars rigidly attached at their bases to the table and provided with ball-caps at their upper ends, the pillars being free to vibrate at their upper ends in any lateral direction, substantially as described.

2. A game-board consisting of a flat table with a plurality of flexible and elastic pillars formed of helical springs rigidly attached at their bases to the table and provided with ball-caps at their upper ends, the pillars being free to vibrate at their upper ends in any lateral direction, substantially as described.

2. In a game, the combination of a flat and slightly-inclined table with a plurality of pillars having ball-cups at their upper ends, balls for the ball-cups, a top, the body of which is a height above the table which is greater than the diameter of the balls, an inclining rolling for the table at a height even with the body of the top, a series of pockets at the lower end of the table and outside the rolling, and passage-ways under the rolling and on the surface of the table between the portion of the table within the rolling and the pockets, substantially as described.

697,575. COMPOSITE WIRE AND METHOD OF MAKING SAME. ARTHUR T. WALL, East Greenwich, R. I. Filed Dec. 20, 1900. Serial No. 41,846. (No model.)

Claim.—1. As a new article of manufacture, a composite wire comprising a thin and attenuated metallic tubular shell filled throughout its interior with a non-metallic substance in a finely-divided state.

2. The method of making composite wire, consisting in filling a hollow cylinder of ductile metal throughout its interior with a non-metallic substance in a finely-divided state, and then drawing said metallic cylinder into an attenuated wire to form a thin tubular outer metallic shell including a finely-divided substance.

697,576. GARMENT. JAMES J. WALKER and JOHN S. BUCKNER, Wapakoneta, Ohio; last inventor assignor to said Walker. Filed Jan. 12, 1901. Serial No. 42,908. (No model.)

Claim.—A shirt, the upper front part C, thereof being essentially in the form of an inverted V, the edges being curved and extending from the armpit on each side to the center of the neck, and the flaps D, D, integral with the shoulder and back portions of the shirt, the edges of said flaps being curved to correspond with the curved edges of the front and which they overlap, said front and flaps being provided with buttons and buttonholes at the bottom and intermediate points and a draw-string extending around the upper edge of the back portion and along the upper edges of the flaps, the ends of said string projecting beyond the ends of the flaps, substantially as shown and described.

697,577. SPROCKET ATTACHMENT. JOHN S. WALKER, Springfield, Mass. Filed Sept. 21, 1901. Serial No. 75,001. (No model.)

Claim.—1. A device of the class described comprising arcuate members having sprocket-teeth on their outer peripheries and having circumferential grooves in their inner peripheries and recesses in the bottoms thereof, a tongue-and-groove connection between certain member ends, the tongue and the walls of the groove having perforations therethrough, and means for engagement with the perforations when aimed to hold the members against pivotal movement the remaining member ends being hinged removably together.

2. A device of the class described comprising arcuate members having sprocket-teeth on their outer peripheries and having grooves in their inner peripheries having depressions in the bottoms thereof, to receive the edge and teeth of a wheel, a universal hinge connection between certain member ends to permit of folding in its flat against each other and to permit of movement in the plane of the members to apply and remove them, and locking means between their member ends to hold the members in mutual engagement.

697,578. STACKER. SAMUEL F. WALKER, Wapakoneta, Ohio. Filed Dec. 11, 1900. Serial No. 39,067. (No model.)

Claim.—1. In a portable grain, hay and straw stacker, the combination of a pair of open runners, open front and rear knee-blocks mounted on said runners, a pair of cross-beams mounted on rear knee-blocks, a cross-beam mounted on front knee-blocks, power mechanism, vertical mast carrying arms and pulleys mounted on rear knee-blocks, vertical post and adjustable arms carrying pulleys mounted on front cross-beam and front knee-blocks, conveyor-frame carrying conveyor-aprons, mounted on adjustable arms carried by front knee-blocks and arms carried by vertical mast, sprocket-chains communicating from power mechanism to the conveyor-frame, substantially as described.

2. In a portable grain, hay and straw stacker, the combination of a pair of open runners, open front and rear knee-blocks carried by said runners, a pair of cross-beams mounted on rear knee-blocks, power mechanism, comprising a stationary rim, a rotating rim loosely mounted on the stationary rim, a stationary rim 11' mounted to the first-mentioned stationary rim mounted on rear open-beams, a horizontal shaft carrying pinion and sprocket-wheel, mounted on cross-ties and inside rear knee-blocks, said pinion engaging cog on rotating rim, adjustable arms pivotally secured to front knee-blocks, a horizontal shaft carried by said arms, double-sprocket-wheel loosely mounted on said shaft, vertical mast mounted over the knee-blocks and the power mechanism, adjustable arms carried by said mast, conveyor-frame carrying conveyor-aprons supported on said arms and mast at the rear end of the machine, and the adjustable arms at the front end, sprocket-wheel and sprocket-chain transmitting power from the power mechanism to the conveyor-frame, substantially as described.

3. In a portable grain, hay and straw stacker, a pair of open runners, open knee-blocks mounted thereon, cross-beams, power mechanism, and vertical mast carrying adjustable arms, mounted on rear knee-blocks and runners, cross-beam and adjustable arms carried by front knee-blocks, vertical post supported on said cross-beam, guide roller and supporting-braces carried by said adjustable arms, conveyor-frame adapted to carry conveyor-apron supported on adjustable arms, sprocket-wheels and sprocket-chains adapted to transmit power from the power mechanism to the conveyor-apron, substantially as described.

4. In a grain, hay and straw stacker, a pair of channelled runners, open knee-blocks, mounted on said runners, cross-beams and power mechanism mounted on rear knee-blocks, vertical mast carrying adjustable arms mounted over the power mechanism and said cross-beams, cross-beam carried by front knee-blocks, vertical post mounted on and carried by said cross-beam, adjustable arms pivotally secured to said front knee-blocks, adapted to raise and lower the conveyor-frame, said conveyor-frame supported on said arms at the front and on adjustable arms carried by vertical mast at the rear, adjustable aprons, and adjustable depending frames carried by conveyor-frame, and means for transmitting power from the power mechanism to the conveyor-frame, substantially as described.

5. In a portable grain, hay and straw stacker, the combination of a pair of open runners, adjustable arms 3 and 4 secured to their ends, cross-beam 36 to their front ends, open knee-blocks, cross-beams, and power mechanism, mounted on rear ends of said runners, open knee-blocks and cross-beam mounted near the front end of said runners, vertical post and adjustable arms carried by said cross-beam and front knee-blocks, vertical mast carrying adjustable arms mounted from the rear knee-blocks, conveyor-frame carrying conveyor-apron, carried by said adjustable arms in front and the adjustable arms carried by vertical mast at rear, supporting-braces 35, spiral springs 57 and supporting-braces 55 and means for raising and lowering the conveyor-frame, and means for transmitting power from the power mechanism to the conveyor-frame, substantially as described.

6. In a portable grain, hay and straw stacker, the combination of a pair of open runners, shields closing open tops of said runners, open front and rear knee-blocks mounted thereon, cross-beams, power mechanism and vertical masts carrying arms, mounted on rear knee-blocks, cross-beam and adjustable arms carrying horizontal shaft mounted on front knee-blocks, conveyor-frame carrying rollers and conveyor-apron and, hood mounted on horizontal shaft and arms carried by vertical masts, horizontal shaft carrying pinion and sprocket-wheel mounted on cross-beam and inside half of rear knee-block, sprocket-chains carried by said sprocket-wheel through open runners under hold-down pulleys, transmitting power from power mechanism to conveyor-roller carried by front end of conveyor-frame, substantially as shown and described.

697,579. DEVICE FOR MIXING LIQUIDS, PARTIAL LIQUIDS OR THE LIKE. HENRY C. WHITTIER and WILLIAM J. DARRINER. Cincinnati, Ohio. Filed Dec. 2, 1901. Serial No. 34,308. (No model.)

Claim.—1. In a mixing device of the character described, the combination of a shaft with a bung-shaped lower end, and a gear D at its upper end, a central longitudinally-slidable operating-shaft splined within and to said gear and slidable longitudinally of the shaft and gear, an upper pivot-piece for blades surrounding and splined to said operating-shaft and connected to positively rotate therewith, with the operating-shaft slidable longitudinally therethrough, a bearing for and surrounding the pivot-piece located within the bung-shaped lower end, a lower pivot-piece for blades at the lower end of the shaft, a series of blades pivoted to said upper pivot-piece, a series of blades pivoted to said lower pivot-piece and pivots between the two series of blades, for forming two interlapped series of blades arranged in upward extension positively driven from top and bottom, all substantially as and for the purpose specified.

2. In a mixing device of the character described, the combination of the shaft A having the bung-shaped lower end *a'* and the gear D, gear E and crank F at its upper end, the shaft B, the pivot-piece K, the pivot-piece K' secured to the lower end of the shaft, two series of blades I and I' pivoted together in upward extension, with pivots between the blades I and the pivot-piece K and pivots between the blades I' and the pivot-piece K', with the shaft B splined to and slidable longitudinally through the gear D and pivot-piece K and constructed and arranged for securing the pivot-pieces K and K' against rotary motion to the shaft B for imparting direct power at the top and bottom of the series of blades, the bearing H in the bung-shaped lower end *a'* for the pivot-piece K, the sleeve b secured to shaft B, the collar c taking about the sleeve and secured against longitudinal movement thereon, the handle G on the collar c, the slot e in which the handle freely slides extending through the side of the shaft A, and the catch e' extending through the side of the shaft A connecting with the slot e for receiving the handle from the slot and maintaining the shaft B in elevated position and the blades I I' in spread relation, all constructed and arranged substantially as and for the purpose specified.

3. In a mixing device of the character described, the combination of the shaft A having the bung-shaped lower end *a'* and the gear D, gear E and crank F at its upper end, the shaft B, the pivot-piece K, the pivot-piece K' secured to the lower end of the shaft, two series of blades I and I' pivoted together in upward extension, with pivots between the blades I and the pivot-piece K and pivots between the blades I' and the pivot-piece K', with the shaft B splined to and slidable longitudinally through the gear D and pivot-piece K and constructed and arranged for securing the pivot-pieces K and K' against rotary motion to the shaft B for imparting direct power at the top and bottom of the series of blades, the bearing H in the bung-shaped lower end *a'* for the pivot-piece K, the sleeve b secured to shaft B, the collar c taking about the sleeve and secured against longitudinal movement thereon, the handle G on the collar c, the slot e in which the handle freely slides extending through the side of the shaft A, and the catch e' extending through the side of the shaft A connecting with the slot e for receiving the handle from the slot and maintaining the shaft B in elevated position and the blades I I' in spread relation, the pin I and knob P for taking against the inner wall of the shaft A and the spring L for urging the collar c about its axis and the handle G into its catch e' all constructed and arranged substantially as and for the purpose specified.

697,580. APPARATUS FOR THE PRODUCTION OF FIBERLESS FILAMENTS. WILLIAM A. P. WILSON, London, England. Filed Aug. 12, 1901. Serial No. 33,514. (No model.)

Claim.—1. In apparatus for the production of fibrous filaments in combination, a receptacle for the solution, casings for the reception of the filaments discharged from the receptacle, and means for effecting the relative motion of the receptacle and casings.

2. In apparatus for the production of fibrous filaments in combination, a receptacle for the solution, casings for the reception of the filaments discharged from the receptacle, and means for giving a gyratory motion to the casings.

3. In apparatus for the production of fibrous filaments in combination, a receptacle for the solution, casings for the reception of the filaments discharged from the receptacle, a disk upon which such casings are mounted, and means for giving a gyratory motion to the disk.

4. In apparatus for the production of fibrous filaments in combination, a receptacle for the solution, casings for the reception of filaments discharged from the receptacle, a disk upon which such casings are mounted, wheels arranged beneath the disk and connection between the wheels and the disk by which a gyratory motion is given to the disk on the rotation of the wheels.

5. In apparatus for the production of fibrous filaments in combination, an air-tight receptacle for the solution, an air-pump in communication with said receptacle to maintain pressure of air upon the solution contained therein, casings for the reception of the filaments discharged from the receptacle, and means for effecting the relative motion of the receptacle and casings.

6. In apparatus for the production of fibrous filaments in combination, a receptacle for the solution, a water-jacket for said receptacle, casings for the reception of the filaments discharged from the receptacle, and means for effecting the relative motion of the receptacle and casings.

7. In apparatus for the production of fibrous filaments in combination, a receptacle for the solution, casings for the reception of the filaments discharged from the receptacle, removable apertures within said casings upon which the filaments are wound, and means for effecting the relative motion of the receptacle and casings.

8. In apparatus for the production of fibrous filaments, a circular receptacle for the solution, valve-cocks radially arranged thereon by means of which the solution is discharged therefrom in filaments, casings for the reception of the filaments, and means for effecting the relative motion of the receptacle and casings.

9. In apparatus for the production of fibrous filaments, a circular receptacle for the solution, valve-cocks radially arranged thereon by means of which the solution is discharged therefrom in filaments, needles mounted in the valve-cocks, casings for the reception of the filaments, and means for effecting the relative motion of the receptacle and casings.

697,581. DRILLING-MACHINE. CARL A. WHITMAN, Chicago, Ill. Filed Apr. 1, 1901. Serial No. 92,000. (No model.)

Claim.—In a drilling-machine, the combination of a standard having forked arms at its upper end, one of said arms being vertical, a drill-shaft journaled in bearings on said vertical arm, an inclined shaft journaled in bearings in said forked arms and geared to said drill-shaft, a friction-cone on said inclined shaft, the upper side of said cone being disposed in a horizontal plane, a horizontally-disposed power-shaft, journaled in bearings on said forked arms and having flat and loose pulleys thereon, a cylindrical, elongated pulley 20 on said power-shaft, opposite said friction-cone, a longitudinally-movable shifting-rod, in supports with which said forked arms are provided, a pulley and steps on said shifting-rod, and an endless friction-belt, connecting said pulley and said pulley 20, said belt engaging said friction-cone and being shiftable thereon by said rod, to vary the speed of the drill-shaft, substantially as described.

tion-cone, a longitudinally-movable shifting-rod, in supports with which said forked arms are provided, a pulley and steps on said shifting-rod, and an endless friction-belt, connecting said pulley and said pulley 20, said belt engaging said friction-cone and being shiftable thereon by said rod, to vary the speed of the drill-shaft, substantially as described.

697,582. DRAWER FOR SEWING-MACHINE STANDS OR OTHER ARTICLES OF FURNITURE. SAMUEL H. WHITMAN, Bridgeport, Conn., assignor to Wheeler & Wilson Manufacturing Company, Bridgeport, Conn., a Corporation of Connecticut. Filed Oct. 20, 1901. Serial No. 90,257. (No model.)

Claim.—1. A drawer-frame, having drawer-supports composed of similar parallel strips rigidly secured at their inner ends to the frame, with their outer ends free and yielding, to adapt themselves to any irregularity in the inward movement of the drawer; and forming ways in which the drawer is moved.

2. A drawer-frame, having parallel drawer-supports rigidly secured at their inner ends to the frame, and having unsecured outer ends grooved to receive the drawer and adapted to yield to conform to and rectify any irregularity in the inward movement of the drawer.

3. A sewing-machine stand, having parallel ways rigidly secured thereto at their inner ends, and with their outer ends grooved longitudinally to receive and support the drawer and free to yield laterally to compensate for any irregularity in the movement of the drawer, combined with a drawer having slides to engage the grooves in said ways, substantially as described.

4. A drawer, having round rods projecting rearwardly therefrom and constituting slides, combined with grooved strips secured at their rear ends only and free to yield laterally at their forward ends, and constituting ways to receive said slides and support and guide the drawer in opening and closing the same.

697,583. SYSTEM OF GLAZING. ARTHUR D. L. WHITMAN, North Adams, Mass. Filed Jan. 24, 1901. Renewed Sept. 20, 1901. Serial No. 74,307. (No model.)

Claim.—1. A casing-strip for the purpose set forth, consisting of a body-strip and an outer covering-strip, the latter consisting of a plastic or flexible material enveloping said body-strip, substantially as described.

2. A sealing-strip for the purpose set forth, comprising a body-strip, and a covering-strip, the latter consisting of pliable sheet metal folded to envelop said body-strip, substantially as described.

3. A sealing-strip for the purpose set forth, consisting of a body-strip and a covering-strip, the latter being composed of tin-foil bent to inclose said body-strip, substantially as described.

4. A sealing-strip for the purpose set forth, comprising a body-strip and a covering-strip, said covering-strip consisting of a plastic metal shield enveloping said body-strip and having a free folded edge portion adapted when pressed to expand, substantially as described.

5. A sealing-strip for the purpose set forth, comprising a body-strip and a covering-strip, said covering-strip consisting of an outer layer of tin-foil bent or folded to embrace the opposite sides and one edge of said body-strip and having a free outwardly-projecting folded portion for the purpose described.

6. In a system of glazing, the combination of a sash provided with a rabbet having its shoulder inwardly disposed, a glass pane, sealing-strips interposed between the pane and shoulder of the rabbet, molding-strips on the interior of the sash to retain the pane in position, and sealing-strips between said molding-strips and the pane, said inner and outer sealing-strips consisting each of a body-strip having an outer covering-strip of a pliable metal, substantially as described.

7. In a system of glazing, the combination of a sash-frame having a rabbet, a glass pane, molding-strips for retaining the pane in position, and sealing-strips interposed between the shoulder of the rabbet, the molding-strips and the pane, each of said sealing-strips consisting of a body-strip and a covering-strip folded longitudinally upon itself to embrace the body-strip and having a free portion projecting beyond the joint and adapted when pressed upon to flatten and more effectually close the joint, substantially as described.

8. In a system of glazing, the combination of a sash having a rabbet and a muntion comprising fixed and removable sections, a glass pane adapted to bear upon the shoulder of the rabbet and fixed section of the muntion, molding-strips for holding the pane in position against outward displacement, sealing-strips interposed between the said molding-strips and the pane and between said pane and the shoulder of the rabbet, and fastening devices for securing the removable section of the muntion in position and acting as stops to hold the pane from sliding, substantially as described.

9. In a system of glazing, the combination of a sash formed with a rabbet having its shoulder inwardly disposed, a muntion consisting of a fixed section and a removable section, a glass pane, molding-strips for retaining the pane against outward displacement, sealing-strips between the said fixed section of the muntion, the shoulder of the rabbet and the molding-strips and pane, each of said strips consisting of a body having a covering of plastic metal, such as tin-foil, and fastening devices for holding said removable section of the muntion in position and acting as stops to prevent sliding of the pane in one direction, substantially as described.

697,584. DRILL-GRINDING MACHINE. HENRY P. WHITE, Kalamazoo, Mich., assigner, by means assignators, to the Whitworth and Norman Company, Grand Rapids, Mich. Filed Apr. 2, 1900. Serial No. 11,300. (No model.)

Claim.—1. In a drill-grinding machine, the combination of a suitable frame; a revolvable grinding-wheel; a suitable drill-holder positioned opposite the face of said grinding-wheel; a bracket to support said drill-holder having a pivotal support in a line transverse to and substantially opposite the apex of the holder whereby the drill can be ground to different angles, for the purpose specified.

2. In a grinding-machine, a suitable drill-holder, means for supporting the same, said means having a pivotal support substantially in line with the apex of said holder for the purpose specified.

3. In a grinding-machine, the combination of a grinding-wheel; a suitable holder, means for supporting the same, said means being pivotally adjustable substantially in a line transverse to the apex of the holder.

4. In a drill-grinding machine, the combination of a casing; a suitable revolvable grinding-wheel carried thereby; a V-shaped drill-holder; a bracket for supporting said holder having an adjustable pivotal support transverse to said drill-holder, and opposite the apex thereof, for the purpose specified.

5. In a drill-grinder, the combination of a suitable frame; a revolvable grinding-wheel thereon; a V-shaped drill-holder opposite the face

of said grinding-wheel; a bracket having a transverse pivot which supports said drill-holder, the pivot being substantially in line with the apex of said holder; a supporting-bracket having an oblique journal supported in a suitable bearing, the axis of which, if extended, would form an acute angle with the face of the grinding-wheel, all coacting for the purpose specified.

6. In a drill-grinder, the combination of a suitable frame; a revolvable grinding-wheel supported thereon; a V-shaped drill-holder supported on an adjustable transverse pivot arranged at the apex thereof; a supporting-bracket having an oblique journal carried by a horizontally-adjustable bracket containing a suitable journal-bearing, coacting for the purpose specified.

7. In a drill-grinding machine, the combination of a suitable frame; a revolvable grinding-wheel thereon; a suitable drill-holder; an adjustable bracket C secured to said frame and having a stud C' thereon which carries the drill-holder whereby it may be raised or lowered for the purpose specified.

8. In a drill-grinding machine, the combination of a V-shaped holder G having a suitable adjustable tail-block; and a rest for the drill arranged within the holder consisting of the finger V extending through the slot at the forward end, pivoted at F' beneath the drill-holder and adapted to project upwardly in a central position; a spring to hold the same yieldingly in the upward position, and a cross-pin V'' near the upper end to prevent the rest extending too far into the flute of the drill, for the purpose specified.

9. In a drill-grinding machine a V-shaped holder having a drill-rest arranged to project up from the bottom of said groove; means to hold the same yieldingly in position whereby it will adapt itself to different sizes of drills when they are placed upon the same and pressed down into the holder.

10. In a drill-grinding machine the combination of a grooved drill-holder with a drill-rest projecting upwardly from the bottom of the groove and adapted to engage the flutes of the drill and supported yieldingly in position whereby when different sizes of drills are placed in the holder the said rest will be depressed whereby the said holder will be adapted to any size of drill within its scope, for the purpose specified.

11. In a drill-grinding machine the combination of a grooved drill-holder with a rest adapted to move upwardly from the bottom of the groove to engage the flutes of different sizes of drills when placed within the holder, as specified.

12. In a drill-grinder, the combination of a V-shaped holder G; a drill-rest V arranged in a slot in the bottom thereof and supported by a pivot F'; a trigger V' to the under side of the same for depressing it in the holder; a spring to hold the same normally into the holder; and a cross-pin V'' at the upper end of the drill-rest, for the purpose specified.

13. In a drill-grinder, the combination of a V-shaped holder G; a drill-rest V arranged in a slot in the bottom thereof and supported by a pivot F'; a trigger V' to the under side of the same for depressing it in the holder; and a spring to hold the same normally into the holder, for the purpose specified.

14. In a drill-grinding machine the combination of a V-shaped

holder; a yielding drill-stop in the bottom thereof; a clamp pivoted to the holder and adapted to press upon the drill to hold it down into the holder and against the drill-stop within the same, for the purpose specified.

15. In a drill-grinding machine the combination of a V-shaped holder with yielding drill-stop in the bottom thereof for the purpose specified.

16. In a drill-grinding machine, the combination of a V-shaped holder; a clamp for retaining the drill in the holder, consisting of an arm P, having a cross-arm P' pivoted to one side of said holder; a spring T to hold the same into contact with the drill in the holder; and a hook U to engage the clamp when the holder is open, for the purpose specified.

17. In a drill-grinding machine, the combination of a V-shaped holder; a clamp for retaining the drill in the holder, consisting of an arm P having a cross-arm P' pivoted to one side of said holder; a spring T to hold the same into contact with the drill in the holder, for the purpose specified.

697,585. HAND-PUMP. ROLLIN E. WHITE, Cleveland, Ohio, assignor to the White Sewing Machine Company, Cleveland, Ohio, a Corporation of Ohio. Filed Apr. 19, 1901. Serial No. 88,541. (No model.)

Claim.—1. The combination of a valve-casing having a discharge-opening, a tubular cylinder movably supported and capable of closing and opening said opening and of discharging through it when it is open, and a pump-piston movable in said cylinder, substantially as specified.

2. The combination of a valve-casing containing a transverse valve-coat, a movably-mounted valve-cylinder having a closed end which is adapted to fit said valve-coat and is adapted to be moved against and from it, and which has an outlet-dust near said closed lower end, and a piston movable in said cylinder, substantially as specified.

3. The combination of a valve-casing containing a transverse valve-coat, a valve-cylinder having a screw-threaded connection with said casing, and having a closed end adapted to fit said valve-coat and having also suitable ports, and a pump-piston movable in said cylinder, substantially as specified.

4. The combination of a valve-casing having an outlet-opening surrounded by a valve-coat, a valve-cylinder having endwise movement adapted to cover or uncover said outlet, which cylinder has a screw-threaded connection with said casing, a piston in said cylinder, and a single device capable of reciprocating said piston and turning said valve-cylinder, substantially as specified.

5. The combination of a valve-casing containing a transverse valve-coat, a valve-cylinder which is screwed into said casing and has a closed lower end formed to fit said valve-coat, and has also a lateral perforation through said lower end, a pump-piston movable in said cylinder, and means whereby said plunger may be reciprocated and said cylinder may be turned, substantially as specified.

6. The combination of a valve-casing containing a transverse valve-coat, a valve-cylinder which is screwed into said casing and has a closed end adapted to fit said valve-coat, a lateral perforation through said closed end, and a lateral perforation above said end, with a pump-piston movable in said cylinder, a piston-rod connected therewith, and means preventing the relative rotation of said piston-rod and cylinder, substantially as specified.

7. The combination of a valve-casing containing a valve-coat, a check-valve on one side of said coat, and a valve-cylinder having, first, a screw-threaded connection with said casing; second, a closed end fitting said valve-coat; third, a lateral perforation through said closed end, and, fourth, a lateral perforation above said screw-threaded connection, with a pump-piston in said cylinder, a piston-rod, and means preventing the relative rotation of said rod and cylinder, substantially as specified.

8. The combination of a receptacle having laterally-extended ears, a

valve-casing secured to its lower end and containing a valve-coat, a valve-cylinder having a screw-threaded connection with said casing, a pump-piston movable in said cylinder, a piston-rod, and means preventing the relative rotation of said rod and cylinder, substantially as specified.

697,586. THROTTLE-VALVE FOR STREAM-CARRIAGE. ROLLIN E. WHITE, Cleveland, Ohio, assignor to the White Sewing Machine Company, Cleveland, Ohio, a Corporation of Ohio. Filed Apr. 19, 1901. Serial No. 88,541. (No model.)

Claim.—1. The combination of a throttle-valve casing having a valve-coat through which one or more ports are formed, said casing being adapted, above said coat, for connection with the inlet-pipe, and adapted, below said coat, for connection with the outlet-pipe, a rotatable valve resting on said coat and having one or more ports extending through it from its top downward and adapted to be brought into line with the ports in the coat, a valve-stem projecting from the lower side of said valve down through and out of said casing, a laterally-projecting arm secured to said valve-stem, a vertical operating-shaft mounted in suitable bearings, an arm secured to said shaft, a link connecting the two arms, and a handle secured to the upper end of said shaft, substantially as described.

2. The combination of a throttle-valve casing having a tapered valve-coat through which one or more ports are formed; said casing being adapted, above said coat, for connection with the inlet-pipe, and being adapted, below said coat, for connection with the outlet-pipe, a rotatable tapered valve fitted to said coat and having one or more ports extending from its top down through its tapered lower surface, a valve-stem projecting from the lower side of said valve down through and out of said casing, a laterally-projecting arm secured to said valve-stem, a fixed horizontal bracket, an operating-shaft stepped therein, a bearing for said shaft above said bracket, a laterally-extended arm secured to said shaft, a link connecting said arm with the arm on the valve-stem, and an operating-handle secured to the upper end of said shaft, substantially as specified.

3. The combination of an automobile-body, a throttle-valve casing having wings wherewith it may be attached to a horizontal frame member of said body, said casing containing a horizontal tapered valve-coat through which one or more ports are formed, an inlet-pipe connected with said casing above said valve-coat, an outlet-pipe connected with said casing below said valve-coat, a rotatable conical valve fitted to said coat and having one or more ports extending from its top down through its tapered sides, a valve-stem secured to the under side of said valve and extended out through said casing, a laterally-extended arm secured to said valve-stem, a horizontal bracket secured to the vehicle-body, an operating-shaft stepped therein, a bearing embracing said shaft above its lower end and secured to the vehicle-body, and an operating-handle removably secured to the upper end of said shaft, substantially as specified.

697,587. CORK-EXTRACTOR. ROBERT J. WILLIAMS, Mount Vernon, Ind. Filed Feb. 22, 1901. Serial No. 68,090. (No model.)

Claim.—1. In a cork-extractor, the combination with a tubular stem provided at one of its ends with a perforating-point and having adjacent to each of its ends a vent-opening communicating with the bore of the stem, of a handle pivotally and slidably connected to said stem and into which the latter is folded when not required for use, and means for automatically removing the cork from the stem after the cork is withdrawn from the bottle.

2. In a cork-extractor, the combination with a stem provided at one of its ends with a perforating-point, of a handle pivotally and slidably connected to said stem and into which the latter is folded when not required for use, a cap adapted to be mounted upon said stem and to slide longitudinally thereon, and a spring encircling said stem and interposed between the handle and said cap, whereby said cap is adapted, under the tension of said spring, to force the cork from the stem after the cork is withdrawn from the bottle.

3. In a cork-extractor, the combination with a stem provided at one of its ends with a perforating-point, of a handle pivotally connected to said stem, said handle being provided with oppositely-disposed longitudinally-extending slots into which the pivot of said handle is arranged and capable of sliding movement, whereby the stem may be folded into said handle when not required for use, a cap adapted to be mounted upon said stem and to slide longitudinally thereon, and a spring encircling said stem and interposed between the handle and said cap, whereby said cap is adapted, under the tension of said spring, to force the cork from the stem after the cork is withdrawn from the bottle.

4. In a cork-extractor, the combination with a tubular stem provided at one of its ends with a perforating-point and having adjacent to each of its ends a transversely-extending vent-opening communicating with the bore of the stem, of a handle pivotally and slidably connected to said stem and into which the latter is folded when not required for use, a cap adapted to be mounted upon said stem and to slide longitudinally thereon, and a spring encircling said stem and interposed between the handle and said cap, whereby said cap is adapted, under the tension of said spring, to force the cork from the stem after the cork is withdrawn from the bottle.

5. In a cork-extractor, the combination with a stem provided at one of its ends with a perforating-point, of a handle pivotally connected to said stem, said handle being provided with oppositely-disposed longitudinally-extending slots in which the pivot of said handle is arranged and capable of sliding movement, whereby the stem may be folded into said handle when not required for use, said handle also having one of its ends curved-throated, a cap normally mounted upon the curved-throated end of said handle but adapted to be positioned upon said stem, when the extractor is required for use, and to slide longitudinally thereon, and a spring encircling said stem and interposed between the handle and said cap, whereby the latter is mounted upon the stem, whereby said cap is adapted, under the tension of said spring, to force the cork from the stem after the cork is withdrawn from the bottle.

6. In a cork-extractor, the combination with a tubular perforating-point having closed ends one of the ends of which is pointed and a gripping-handle pivotally mounted on the opposite end of said stem, of a band or funnel-shaped collar loosely mounted on said stem, said collar having its interior conical surface directed outwardly, and a coil-spring interposed between said collar and said handle, all substantially as and for the purpose set forth.

697,588. HENRY F. FARR. James J. Wynn, Port Wayne, Ind.
Filed Aug. 17, 1908. Serial No. 57,144. (No model.)

Claim.—1. In an electric fan, the combination with a single electromotor, of a support mounted to rotate upon a vertical axis, and two fans both driven from said motor mounted to rotate upon axes on opposite

sides of said vertical axis and tangential thereto so as to rotate said support.

2. In an electric fan, the combination with a single electromotor, of a support mounted to rotate upon a vertical axis, and two fans both driven from said motor mounted to rotate upon axes on opposite sides of said vertical axis and tangential thereto so as to rotate said support, said fans being rotated in the same direction as you face them.

3. In an electric fan the combination of a motor, a support adapted to rotate about an axis, a shaft rotated by said motor and having a gear at each end, and two fans mounted on shafts on opposite sides of said axis and each having a gear at its inner end, one meshing with the gear at one end of said motor-shaft, and the other meshing with the gear at the other end of said shaft, said motor and shafts being situated upon said support.

4. In an electric fan, the combination of a stationary support, a rotary support mounted thereon, a motor, a shaft rotated by said motor, having a gear at each end, and two fans mounted on shafts on opposite sides of said axis and each having a gear at its inner end, one meshing with the gear at one end of said motor-shaft, and the other meshing with the gear at the other end of said shaft, said motor and shafts being situated upon said rotary support.

5. In an electric fan the combination of a motor, a support adapted to rotate about an axis, a shaft rotated by said motor and having a helical gear at each end, and two fans mounted on shafts on opposite sides of said axis, and each having a helical gear at its inner end, the one meshing with the gear at one end of said motor-shaft, and the other meshing with the gear at the other end of said shaft, said motor and shafts being situated upon said support.

6. In an electric fan the combination of a motor, a support adapted to rotate about an axis, a shaft rotated by said motor and having a helical gear at each end, and two fans mounted on shafts on opposite sides of said axis, and each having a helical gear at its inner end, the one meshing with the gear at one end of said motor-shaft, and the other meshing with the gear at the other end of said shaft, the teeth of the gears on said motor-shaft being inclined in opposite directions, said motor and shafts being situated upon said support.

7. The combination with a support mounted to rotate about a vertical axis, of a fan mounted in bearings in said support so that it rotates on an axis oblique to the horizontal and on one side of said vertical axis and tangential thereto so as to rotate said support, and means for rotating said fan.

8. The combination with a support mounted to rotate about a vertical axis, of a fan mounted in bearings in said support so that it rotates on an axis oblique to the horizontal and on one side of said vertical axis and tangential thereto so as to rotate said support, and means for rotating said fan, the reaction due to the paddle-wheel effect of the blades being opposite to that due to the wedging action thereof.

9. The combination with a support mounted to rotate about a vertical axis, and an electromotor carried thereby, of a fan receiving motion from said motor and mounted on said support to rotate upon an axis extended obliquely to the horizontal and on one side of said vertical axis and tangential thereto so as to rotate said support.

10. In an electric fan, the combination with a motor of a support mounted to rotate upon a vertical axis, and two fans mounted to rotate upon axes arranged on opposite sides of the axis of said support and tangential thereto so as to rotate said support, the axes of rotation of said fans being extended obliquely to the horizontal.

11. In an electric fan, the combination with a motor of a support mounted to rotate upon a vertical axis, and two fans mounted to rotate upon axes arranged on opposite sides of the axis of said support and tangential thereto so as to rotate said support, the axes of rotation of said fans being extended obliquely to the horizontal, and said fans being arranged to rotate in the same direction as you face them.

12. An electric fan comprising a support adapted to rotate about a vertical axis, a motor mounted upon said support, a shaft rotated by said

motor and having a helical gear at each end, and two fans mounted on shafts extended angularly to said motor-shaft, and each having a helical gear at its inner end, the one meshing with the gear at one end of said motor-shaft, and the other meshing with the gear at the other end of said shaft, said fan-shafts extended downwardly in an oblique direction, whereby a downward blast is delivered by each of said fans, and the support is caused to rotate by the reactive thrusts of said fans.

13. In an electric fan, the combination with a stationary casing, of a rotary motor-casing, said stationary casing comprising a pair of shells one of which supports said rotary casing and the other of which carries contact-arms for conveying the current to said rotary casing.

14. In an electric fan, the combination with a stationary casing comprising a pair of shells a' and a'' , of a rotary motor-casing having a neck extending within the stationary casing, a collar on said neck supported by a ball-bearing in said shell a' , and conductors in said neck adapted to contact with contact-arms carried by said shell a'' .

15. The combination with a support mounted to rotate upon a vertical axis, of a fan mounted to rotate upon an axis on one side of said vertical axis and tangential thereto so as to rotate said support by a wedging reaction, the axis of rotation of said fan being oblique to the horizontal, and means for rotating said fan in a direction to produce a paddle-wheel reaction opposed to said wedging reaction.

16. The combination with a support mounted to rotate upon a vertical axis, of two fans mounted to rotate upon axes on opposite sides of said vertical axis and tangential thereto so as to rotate said support by a wedging reaction, the axes of rotation of said fans being oblique to the horizontal, and means for rotating said fans in a direction to produce a paddle-wheel reaction opposed to said wedging reaction.

697,589. ELECTRIC FAN. JAMES J. WOOD, Port Wayne, Ind. Filed Feb. 26, 1901. Serial No. 61,042. (No model.)

Claim.—1. The combination in an electric motor of a casing composed of a pair of shells surrounding the field-magnet thereof, the meeting edges of said shells being in a plane transverse to the armature-shaft, means for securing said field-magnet to one of said shells, and means for securing said shells together.

2. The combination in an electric motor of a casing B composed of a pair of shells A' and A'' surrounding the field-magnet thereof, means for securing said field-magnet to said shell A' , and means for securing the other shell A'' to said shell A' .

3. The combination in an electric motor of a casing A composed of a pair of shells A' and A'' surrounding the field-magnet thereof, bolts D entering said shell A' , and projecting through said shell A'' , said field-magnet being secured to said shell A' by nuts on said bolts, and said shells being secured together by nuts on said bolts.

4. The combination in an electric motor, of a brush-holder tube P having a grooved face, and a wedge-shaped slide T fitted in said groove and adapted to be attached to the end of a cable.

697,590. SHOE. JOHN C. WATSON, Brooklyn, N.Y. Filed May 16, 1901. Serial No. 61,235. (No model.)

Claim.—1. A heel or shoe having a divided top, lacing-holes on each side of the division, a series of guides attached to the inside of the shoe further from the division-opening than are the lacing-holes, and an elastic lacing which passes through the said lacing-holes and said guides, the guides and the portion of the lacing between the guides and the lacing-holes being concealed from external view, substantially as described.

2. A heel or shoe having a divided top, lacing-holes on each side of the division, an elastic tongue secured to the inside of the shoe on both sides of the division-opening at a greater distance therefrom than the lacing-holes, a series of guides attached to the shoe between the tongue and the upper on each side of the opening and at a greater distance from the division-opening than are the lacing-holes, and an elastic lacing which passes through the said lacing-holes and said guides, the holes on one side being level with the guides on the other, substantially as described.

697,590

697,591. OPERATING RAILWAY-SWITCHER. ARTHUR YOUNG, JR., North Augusta, S. C. Filed Sept. 14, 1902. Serial No. 20,015. (No model.)

Claim.—1. The combination substantially as described of the switch-points, the switch-bar connecting the same, the operating-frame having a yielding connection with the switch-bar and provided with an inclined flange for engagement by the operating projection on the rolling-stock, said operating projection being provided with a carrier, a frame in which said carrier is movable laterally, a detent-lever for locking the carrier in its lateral adjustment, an operating-lever arranged to adjust the carrier laterally, and a lever arranged to release the detent and locked relatively to the lever for operating the carrier, substantially as and for the purpose set forth.

2. In an apparatus substantially as described, the combination of the operating projection, the carrier therefor, a frame in which the said carrier is movable laterally, a detent-lever by which to lock the carrier in its different adjustments, a rod or connection leading from said detent, an operating device connecting with the rod or connection, and the lever for adjusting the carrier laterally, the point of connection between the rod or connection for operating the detent and its operating device, being arranged to coincide with the pivot-point of the lever for adjusting the carrier in the released position of the detent, substantially as set forth.

3. The combination of the metal points, the spring switch-bar connected therewith and notched for engagement by the locking-belt, and arranged to spring into and out of engagement with said belt, and means for operating said switch-bar, substantially as set forth.

4. In an apparatus substantially as described, the combination with the switch-operating projection, the carrier therefor, the frame in which said carrier is adjustable laterally, the pivoted lever and intermediate devices whereby it adjusts the carrier laterally, the detent for securing the carrier in its different adjustments, the lever for operating said detent, a connection between said lever and the detent, and the lever for adjusting the carrier laterally, the detent-releasing lever being pivoted to the carrier-adjusting lever and having its connection with the rod or connection leading to the detent arranged to coincide with the pivot of the carrier-adjusting lever when the detent is released, substantially as set forth.

5. In a railway-switch the combination with the switch-points and the switch-bar, of the movable frame for operating said switch-bar having means whereby it may be operated by a projection on the rolling-stock, said operating-frame being engaged at one end with the switch-bar and being movable to a limited extent at such end independently of the switch-bar, and a spring for resisting such independent movement, substantially as set forth.

6. In a railway-switch the combination of the switch-points, the switch-bar connecting the same and having an upwardly-projecting beam, the operating-frame having at one end a notch or recess fitting over said beam and made wider than the beam whereby to permit a limited independent movement of the said beam, and a spring operating to arrest such movement, substantially as set forth.

7. In a railway-switch, the combination of the switch-points and the switch-bar having a beam, the operating-frame having a slot or recess in which said beam operates and which is wider than the said beam whereby to permit an independent movement of the parts, and a spring operating between said beam and the frame whereby to cushion the operation of the parts, substantially as set forth.

8. The combination in a railway-switch, of the points, the switch-bar connecting the same and having a beam, the operating-frame having a slot or recess for receiving said beam and made wider than the beam, and a spring rod or bar secured at one end to the beam and at its other end to the operating-frame, substantially as set forth.

9. In a railway-switch the combination with the switch-points and the switch-bar, of the opposite operating-frames and spring devices by which the adjacent ends of the operating-frames are yieldingly connected with the switch-bar, substantially as set forth.

10. In a railway-switch, the combination with the switch-points and the switch-bar, of the operating-frames pivoted at their outer ends and connected at their adjacent ends with the switch-bar and having at their opposite edges flanges spaced apart for the operation between them of the projection of the rolling-stock, substantially as set forth.

11. In a railway-switch substantially as described, the combination of the switch-points, a switch-operating bar in connection therewith, a casing through which said switch-operating bar is passed, said casing having a slot for the passage of the ward of the operating-lever, the operating lever or shaft having a ward arranged to be passed through said slot and adapted to engage the switch-operating bar, and a spring arranged to exert an upward tendency upon the said lever and shaft whereby to press the same into position to adjust its ward out of position for engagement with the switch-operating bar, substantially as set forth.

12. In a railway-switch the combination substantially as described of the switch-points, the operating-bar connected therewith, a notch for engagement by the ward of the operating shaft or lever, the casing through which said operating-bar is passed, said casing having a keyhole-slot, the lever or shaft having a ward and movable through said slot to position for the engagement of its ward with the notches of the switch-operating bar, and the spring arranged in said casing below the keyhole-slot in position to form a seat for the lower end of the operating-lever, whereby it will exert an upward tendency upon said shaft or lever, substantially as set forth.

697,592. FILE AND DISPLAY BOOK. ERNEST REVE, Chesham, Chas. Filed Dec. 2, 1901. Serial No. 65,262. (No model.)

Claim.—1. The combination of a book-cover, leaves separate there-

from, a foundation-piece as C distinct from the leaves and the cover and having slots C', said leaves each having a hinge-leaf E, said hinge-leaf being passed through the adjacent slot and bent and secured flat upon the back of the foundation-piece, substantially as and for the purposes specified.

2. The combination of a book-cover, a foundation-piece C, having slots C', leaves D and a hinge-leaf E, each leaf D being composed of two pieces D¹, D², the edge of the hinge-leaf E being located between the pieces D¹, D², the latter and the hinge-leaf E being united together, the hinge-leaf passing through the adjacent slot C' and secured at the back of the foundation-piece C, substantially as and for the purposes specified.

3. The combination of a book-cover, a foundation-piece C, having slots C', leaves D, and a hinge-leaf E, the latter secured to the leaf D, and passed through the adjacent slot, and bent and secured to the back of the foundation-piece, and means for enabling display or other cards to be held to the side of the leaf E, substantially as and for the purposes specified.

4. The combination of a book-cover, a foundation-piece C, having slots C', leaves D, and a hinge-leaf E, the latter secured to the leaf D, and passed through the adjacent slot, and bent and secured to the back of the foundation-piece, and the corners D¹ on the leaves D, arranged to adapt the leaves to receive the separate file or display papers, and the file, substantially as and for the purposes specified.

5. The combination of a book-cover, a foundation-piece C, having slots C', leaves D each composed of at least two subpieces D¹, said slots by slots, a hinge-leaf E, having one edge held between the subpieces D¹, and the other edge passed through the slot and bent and secured flat against the back of the foundation-piece, and the corners D¹, united to the edge of the leaf D, but separate elsewhere therefrom, substantially as and for the purposes specified.

6. The combination of a book-cover, a foundation-piece C, having slots C', leaves D and a hinge-leaf E, each leaf D being composed of two pieces D¹, D², the edge of the hinge-leaf E being located between the pieces D¹, D², the latter and the hinge-leaf E being united together, the hinge-leaf passing through the adjacent slot C' and secured at the back of the foundation-piece C, the leaves D being of the same size, and when down presenting a broad outer edge, on which index or other characters may be, substantially as and for the purposes specified.

697,593. SAND-MOLDING MACHINE. DANIEL L. ADAMS, Belling, Pa. Filed June 27, 1901. Serial No. 65,212. (No model.)

Claim.—1. A ramming mechanism for sand-molding machines, embracing a rammer-carrying rod having means by which it is raised and lowered, combined with a guiding device therefor, embracing an arm pivoted at one end to the rammer and having its other end pivoted at a fixed point, said arm having a plurality of members pivoted together at their confronting ends, and means actuated to turn said arm on the latter pivot and thereby swing said rammer laterally.

2. A ramming mechanism for sand-molding machines, embracing a rammer-carrying rod having means by which it is raised and lowered, combined with a guiding device therefor, embracing an arm pivoted at one end to the rammer and having its other end connected to a pivotal shaft, said arm having a plurality of members pivoted together at their confronting ends, and means for turning said shaft to thereby swing said rammer laterally.

3. A ramming mechanism for sand-molding machines, embracing, in combination, an operating-shaft, a rammer, rammer-rods attached to opposite ends of said rammer, connections between said rods and shaft for actuating the rods to thereby raise and lower said rammer, a rock-shaft, and guide-arms, each pivoted at one end to said rammer and having its other end secured to said rock-shaft and each comprising two members pivoted together at their confronting ends, and means actuated to turn said rock-shaft and thereby swing said rammer.

4. In a sand-molding machine, the combination with a frame, a shak-table, a hopper, and means for feeding sand from said hopper to the shak-

of a shaft, means for actuating the same, eccentrics on said shaft, eccentric-strap engaging said eccentrics, rods carried by said straps, rammer mounted to said rods, and arms each pivotally connected at one end to the rammer and at its other end to a fixed point on the machine-frame, each of said arms being formed of two parts hinged together at their contiguous ends, and means for folding or opening the hinged parts to swing the suspended rammer.

5. In a sand-molding machine, the combination with a rammer-actuating shaft, and an eccentric thereon, of an eccentric-strap engaging said eccentric, a rammer, a rod to the lower end of which said rammer is secured, said rod being suspended directly from said strap and supported to have longitudinal movement relative thereto and a buffer-spring for said rod and rammer.

6. In a sand-molding machine, the combination with a rammer-actuating shaft, and an eccentric thereon, of an eccentric-strap engaging said eccentric and having an opening in one end, a rod having one of its ends projecting into said opening and movable longitudinally therein, a rammer secured to the other end of said rod, means on said rod by which it is supported directly from said strap, and a buffer-spring for absorbing excessive pressure imposed on said rammer.

7. In a sand-molding machine, the combination with a rammer-actuating shaft, and an eccentric thereon, of an eccentric-strap engaging said eccentric, a rod supported directly by said strap and having a rammer at its lower end, said rod having means by which the length of its projection from said strap is adjustably determined and having movement relative to said strap, and a buffer-spring for absorbing excessive pressure imposed on the rammer.

8. In a sand-molding machine, the combination with a rod, said means for supporting and for raising and lowering the same, of a rammer carried by said rod and partaking of the movements thereof, said rammer having movement relative to the means for supporting and raising and lowering said rod, a buffer-spring for absorbing excessive pressure imposed on the rammer, and a guiding means for said rod independent of its said raising and lowering and supporting means.

9. In a sand-molding machine, the combination with the machine-frame, a rammer-actuating shaft, and an eccentric thereon, of an eccentric-strap engaging said eccentric, a rod supported directly from said strap and having movement relative thereto, a rammer secured to said rod and partaking of the movements thereof, a buffer-spring for said rammer and rod, and a guiding means for said rod and rammer, said guiding means being pivoted to said rod and the machine-frame at its respective ends.

10. In a sand-molding machine, the combination with a rammer-actuating shaft, an eccentric thereon, an eccentric-strap engaging said eccentric, a rammer, a rod to which said rammer is secured, and a nut threaded upon the upper end of said rod and serving to suspend said rod directly from said strap and to adjustably determine the length of the projection of said rod from said strap.

11. In a sand-molding machine, the combination with a rammer-

actuating shaft, and an eccentric thereon, of an eccentric-strap engaging said eccentric, a rod having longitudinal movement relative to said strap, a nut threaded upon the upper end of said rod and engaging said strap, said nut serving to suspend said rod directly from said strap and adjustably to determine the length of the projection of the rod from the strap, a rammer secured to said rod, and a buffer-spring for said rod and rammer.

12. In a sand-molding machine, the combination with a rammer-actuating shaft, and an eccentric thereon, of an eccentric-strap engaging said eccentric and having an opening through one end and an open portion with which said opening communicates, a rod projecting through said opening into said open portion, said rod being movable relative to said strap, a nut threaded upon said rod and located in said open portion of the eccentric-strap, a rammer secured to said rod, and a buffer-spring for said rod and rammer.

13. In a sand-molding machine, the combination with the frame, flask-table, a hopper, and means for feeding sand from said hopper to the flask, of a shaft, means for actuating the same, an eccentric on said shaft, an eccentric-strap engaging said eccentric, a rod suspended from said strap, a rammer secured to said rod, said rod being movable relative to said strap, a buffer-spring connected with said rod and strap, an arm pivotally connected at its opposite ends to the rammer and machine-frame, said arm being composed of two members hinged together at their contiguous ends, and means for folding or opening the same, for the purpose specified.

14. A ramming mechanism for sand-molding machines, embracing a main driving-shaft, a loose pinion and a clutch device thereon, a rammer-operating shaft, a rammer connected therewith, a fixed gear-wheel on the latter shaft geared with said pinion, a clutch-lever and means controlled by said gear-wheel for actuating said lever.

15. A ramming mechanism for sand-molding machines, embracing a main driving-shaft, a loose pinion thereon, a spring-pressed sleeve on said shaft, a rammer-operating shaft, a collar loosely mounted thereon and confined against movement longitudinally thereof, a pivoted lever connected with said sleeve and collar, a fixed gear-wheel on said rammer-operating shaft geared with said pinion, a cam carried by said gear-wheel, and a bell-crank connected with said lever and projecting into the path of said cam.

16. A ramming mechanism for sand-molding machines, embracing a main driving-shaft, a loose pinion thereon, a spring-pressed sleeve on said shaft, a rammer-operating shaft, a collar loosely mounted thereon and confined against movement longitudinally thereof, a pivoted lever connected with said sleeve and collar, a fixed gear-wheel on said rammer-operating shaft geared with said pinion, a cam carried by said gear-wheel, a spring-pressed bell-crank having a heel portion or stop, said bell-crank being connected with said lever and arranged to be actuated automatically by said cam, and a means connected with said bell-crank by which the same may be actuated manually, substantially as described and for the purposes set forth.

17. In a sand-molding machine the combination with the frame, the flask-table, the sand-hopper, and the sand-feed mechanism, of the main driving-shaft with loose pinion and clutch device thereon, the rammer-operating shaft having a fixed gear-wheel in mesh with said pinion, the clutch-lever arranged to be automatically operated by said gear-wheel, and the rammer connected with said rammer-operating shaft substantially as set forth.

18. In a sand-molding machine the combination with the frame, the flask-table, the sand-hopper, and the sand-feed mechanism, of the main driving-shaft with loose pinion and clutch device thereon, the rammer-operating shaft having a fixed gear-wheel in mesh with said pinion, the clutch-lever arranged to be automatically operated by said gear-wheel, the rammer connected with said rammer-operating shaft, and means for operating said clutch independently of the said gear-wheel, substantially as set forth.

19. In a sand-molding machine, the combination with a flask-support, of a sand-feed mechanism therefor comprising a hopper having a closed bottom and provided with openings in its sides, and an endless feed-belt traveling across the lower portion of said hopper and through said openings and having projections which travel therewith and are caused thereby to positively discharge the sand from the hopper through one of said openings, substantially as described.

20. In a sand-molding machine, the combination with a flask-support, of a sand-feed mechanism therefor mounted above and at one side of said support, said hopper having a horizontal closed lower end and provided with openings in its opposite sides, an endless feed-belt traveling across the lower portion of said hopper above said bottom and through said openings and having projections which travel therewith and are caused thereby to positively discharge the sand from the hopper through one of said openings, and a discharging means for the sand, arranged between the latter opening and the flask, substantially as described.

697,594. DRAWING IMPLEMENT. FREDERICK A. ALTHOFF, Canada, Pa. Filed Sept. 21, 1891. Serial No. 74,694. (No model.)

Claim.—1. An implement of the class described, comprising a transparent body provided with a guiding edge; a means in said guiding edge; and an opaque substance secured in said recess, substantially as set forth.

2. An implement of the class described, comprising a body of transparent material having opposite parallel plane surfaces provided with a guiding edge; a recess extending parallel with said guiding edge and intermediate of said plane surfaces; and an opaque substance secured in said recess, substantially as set forth.

3. An implement of the class described, comprising a flexible transparent body provided with a guiding edge; a recess in said guiding edge; and an opaque substance secured in said recess, substantially as set forth.

4. An implement of the class described, comprising a body of transparent flexible material having opposite parallel plane surfaces provided with a guiding edge; a recess extending parallel with said guiding edge and intermediate of said plane surfaces; and an opaque substance secured in said recess, substantially as set forth.

697,595. AUTOMATIC PUMPING MECHANISM. ALFRED R. AMMANN, New York, N. Y., assignor to himself and Max I. Schindler, New York, N. Y. Filed Aug. 20, 1899. Serial No. 57,595. (No model.)

Claim.—1. An improved automatic pumping apparatus, comprising a movably-suspended weight, a casing provided with an inlet and an outlet, a float within the casing, means for intermittently discharging the contents of the casing, a pump proper, power-transmission device between the float and the weight, power-transmission device between the float and the pump proper, and means operated by the weight in its movement for throwing said power-transmission device into and out of operation.

2. An improved automatic pumping apparatus, comprising a casing provided with an inlet and outlet, a float within the casing, means for intermittently discharging the contents of the casing, a pump proper, storage means for storing the energy supplied by the movement of the float within the casing, power-transmission device between said float and said storage means, and power-transmission device between said storage means and said pump proper, said storage means embodying device for throwing said power-transmission device into and out of operation.

3. An improved automatic pumping apparatus, comprising a casing provided with an inlet and an outlet, a float within the casing, means for intermittently discharging the contents of the casing, said means being operated by said float, a pump proper, storage means for storing the energy supplied by the movement of the float within the casing, power-transmission device between said float and said storage means, and power-transmission device between said storage means and said pump proper.

said storage means embodying device for throwing said power-transmission device into and out of operation.

4. In an automatic pumping apparatus, a pump proper, a casing provided with an inlet and an outlet, a float within the casing, means for intermittently discharging the contents of the casing, a movably-suspended weight, power-transmission device between the float and the weight, and power-transmission device between the weight and the pump proper, said power-transmission device embodying each an adjustable member actuated by the weight in its movement.

5. In an automatic pumping apparatus, a pump proper, a casing provided with an inlet and an outlet, a float within the casing, means for intermittently discharging the contents of the casing, a movably-suspended weight, power-transmission device between the weight and the float, and power-transmission device arranged between the weight and the pump proper and embodying an adjustable member actuated by the weight in its movement.

6. In an automatic pumping apparatus, a pump proper, a casing provided with an inlet and an outlet, a float within the casing, means for intermittently discharging the contents of the casing, a movably-suspended weight, a rotary drum, a cable or rope connected with said weight and adapted to be wound upon said drum, power-transmission device between said float and said drum, power-transmission device between said drum and said pump proper, and device operated by said weight in its movement for throwing said power-transmission device into and out of operation.

7. In an automatic pumping apparatus, a pump proper, a casing provided with an inlet and an outlet, a float within the casing, means for intermittently discharging the contents of the casing, storage means for storing the energy supplied by the movement of the float within the casing, a rotary drum operatively connected with said storage means, adjustable power-transmission device between said float and said drum, adjustable power-transmission device between said drum and said pump proper, and means for operating said power-transmission device, said power-transmission device embodying each a flexible gear-carriage provided with a shifting counterbalance member.

8. In a pumping apparatus of the class described, a driven mechanism, a movably-suspended weight, a drum with which the weight is connected in suspended position, means for operating the drum to raise the weight, and power-transmission device between the drum and the driven mechanism whereby the weight in its downward movement operates the latter, said power-transmission device embodying a movable gear-carriage provided with a gear mechanism adapted for operative connection with the drum and with the driven mechanism, said gear-carriage being operated in its movement by the moving weight and embodying a counterbalance device, substantially as and for the purpose set forth.

697,596. HOSE-SUPPORTER. ELMER AMMANN, Applicant Pa. Filed Oct. 14, 1891. Serial No. 72,696. (No model.)

Claim.—1. The herein-described hose-supporter comprising front and back straps, with means for attaching the same to the carriage of the wearer, in combination with front and rear loops adapted to be connected to the front and rear parts of the hose to be supported, and each of said loops provided with a clasp attachment to one of the straps above, together with transverse bands connecting a front and rear strap at each side, and an additional transverse band connecting the rear straps, whereby the main part of the supporter is raised, and the several loops effect said ends easily separable therefrom, substantially as specified.

2. In a hose-supporter of the kind described, the combination with front and back supporting-straps, transverse bands connecting a front and back strap at either side, the upper ends of said straps having suitable connection to the carriage of the wearer, another transverse band connecting the back straps in the vicinity of their connection to the carriage, in combination with a number of pairs of hose-clamps connecting with the hose front and back, loops to which said hose-clamps are connected, and the said loops further connected by means of separable clasps to the front

and back supporting-straps, whereby the loops are rendered readily separable from the supporting-straps without separation from the hose, substantially as specified.

697,597. TIRE-INFLATER. EMERY E. ASHBY, Boston, Mass. Filed Apr. 20, 1899. Renewed Mar. 14, 1900. Serial No. 68,597. (No model.)

Claim.—An inflating device comprising a pump member and a supporting member, the latter having a substantially flat ground-piece to be held between the operator's feet and the ground, the pump member having a coupling laterally remote from said ground-piece and of a substantially right nature to connect with the tire-valve and form a support for the pump member, and an adjustable connection between the pump member and the supporting member comprising a stem formation on one of the members and a clamp on the other member slidably adjustable longitudinally of said stem formation whereby the pump member may be raised and lowered to change the elevation of its coupling with respect to the ground-piece.

697,598. WATER-GATE. CHARLES H. BAKER, York, Maine. Filed Aug. 20, 1891. Serial No. 72,698. (No model.)

Claim.—The combination with a casing having oppositely-disposed openings, of pipe-sections within these openings, and having their inner ends forming valve-seats, a non-rotating valve-stem, a valve slideable between and in contact with said ends and valve seats in two parts, and springs interposed between the two parts of the valve, for holding said parts in contact with the seats, said valve-stem extending above the valve to form a chamber having ball-and-groove guides upon its inner wall whereby the chamber is restricted in its upper part, to prevent the parts of the valve spreading apart when the valve is open, and a stop at the upper portion of the guides to prevent unnecessary opening of the valve.

697,599. LOCK. CHARLES W. HANCOCK, Raleigh, N. C. Filed June 12, 1891. Serial No. 68,599. (No model.)

Claim.—In a mortise-lock, the combination with a casing; of a latch-bolt having a body portion formed with a slot, the walls of which are provided intermediate their ends with oppositely-located lugs, a support upon the casing projecting into the slot, a protruding-spring supporting the rear portion of the slot and caused to aid support and having forwardly-curved ends bearing against said lugs, an annular-grooved key-tumbler, a rotary key-bolt having a collar loosely fitting the groove in the key-tumbler, said bolt and collar being longitudinally divided, forming corresponding sections, means for adjustably securing said sections to-

gether to regulate the frictional engagement of the collar with the key-tumbler, a detent-spring for causing resistance to the movement of the key-tumbler, a contact-piece carried by the key-bolt, a contact-piece on the key-tumbler to engage said contact-piece on the bolt and turn said bolt in one direction or the other, the tumbler having nearly one complete revolution in order to bring the contacts in engagement in either direction of movement, and a stop limiting the extent of rotation of said key-tumbler, substantially as set forth.

697,600. SEWING MACHINE. EDWIN R. DEAR, Warren, N. H., assignor to the Loop-Lock Machine Company, Portland, Me., and Boston, Mass. Filed Aug. 21, 1899. Serial No. 58,600. (No model.)

Claim.—1. A sewing machine comprising an oscillating needle, means for advancing the same through the work, an arm which is adapted to engage one side of the needle and positively hold it against movement in one direction, a pressure-foot, means for yieldingly forcing said foot against the opposite side of the needle, a shoulder on said pressure-foot having a flange which moves in a predetermined path, a pivoted latch having a flange which is adapted to engage the flange of said shoulder, the pivot of said latch being so arranged that the path described by the flange of the latter as it is swung on its pivot intersects the path of the flange on the shoulder at nearly right angles, the surface of one of said flanges being inclined at an acute angle to the path of any point thereon so that as the flange of the latch crosses the path of the flange of the shoulder, the are described by a given point in the flange of the latch will intersect the flange of the shoulder in whatever position the latter may assume while in engagement with the work, and means for swinging the flange of said latch into engagement with the flange of the shoulder after the foot has been brought into engagement with the work and before the needle passes therethrough, thereby positively locking said foot in whatever position it may assume while in engagement therewith.

2. A shoe-sewing machine comprising an oscillating needle, means for advancing the same through the work, an arm, means for positively forcing the same rearwardly into engagement with the sole of the shoe, a presser-foot, means, acting through a spring, for forcing said presser-foot forwardly so that it will force the upper against the edge of the sole, a shoulder on said presser-foot a pivoted latch having its pivot so arranged that said shoulder moves away therefrom when said presser-foot moves forwardly, an engaging surface on said latch which is adapted to engage said shoulder in various positions of the latter and lock said presser-foot against backward movement, a lever, a rod which connects said latch and lever, a spring through which said lever must act to move said latch forwardly into engagement with said shoulder, and means for oscillating said lever so that the engaging surface of said latch will be brought into engagement with said shoulder after the presser-foot has been brought into engagement with, and before the needle passes through, the work.

3. A shoe-sewing machine comprising a hooked needle, means for advancing the same through the sole and upper in turn, means for placing the thread in the needle-hook while the needle is in its advanced position and for causing it to draw back a loop of thread through the work, a presser-foot having a forked end, means for causing the same to press the upper against the edge of the sole on each side of the path of the needle, a presser-finger, means for causing the same to press the upper against the edge of the sole below the path of the needle and in advance of the passage of the needle through the upper, and means for throwing said foot out of engagement with the upper while the needle is drawing back its loop.

4. A shoe-sewing machine comprising a hooked needle, means for advancing the same through the sole and upper in turn, means for placing the thread in the needle-hook while the needle is in its advanced position and for causing it to draw back a loop of thread through the work, a presser-foot, means for causing the same to press the upper against the sole at each side of the path of the needle, a presser-finger, means for causing the same to press the upper against the edge of the sole below the path of the needle and in advance of its passage through the upper and means for moving said presser-foot out of engagement with the upper while the needle is drawing back its loop.

5. A shoe-sewing machine comprising a needle, a presser-foot having two arms at its lower end and between which the needle may pass, means for causing said arms to press the upper against the sole at each side of the path of the needle, a finger, means for advancing the same so that it will engage the upper directly below the ends of said arms, means for advancing the needle so that it will pass through the work and between said arms, and its point will emerge inside the angle included by the foot and finger, means for causing the needle to draw back a loop of thread through the work and for moving said foot and finger out of engagement with the upper while the needle is drawing back its loop.

6. A shoe-sewing machine comprising a needle, means for oscillating the same, and for causing it to draw a loop of thread through the work, a presser-foot having two arms at its lower end, inclined surfaces at the ends of said arms, means for causing said arms to press the upper against the edge of the sole at each side of the path of the needle, a presser-finger having an inclined surface at its end and on the upper side thereof, means for advancing said finger and for causing said inclined surface to come into engagement, and the under side of the finger to hold the upper against the flange of the sole in advance of the passage of the needle therethrough and means for separating said foot and finger while the needle is drawing in its loop.

7. A shoe-sewing machine comprising a needle, means for advancing the same through the work and causing it to draw back a loop of thread as it recedes, a presser-foot, and a presser-finger, each being bifurcated for the passage of the needle, means acting through springs for causing said foot and finger to press the upper against the shoulder of the sole on each side of the path of the needle, and against the flange of the sole below the path of the needle, respectively, in advance of the passage of the needle through the work, and means for withdrawing said foot and finger from the work while the needle is drawing back its loop, and for separating them so that the strand of thread leading from the preceding stitch may be drawn between them and against the upper.

697,601. MATCH-BOX. SHOSH BRESN, Brooklyn, N. Y., assignor to Frank Katz, Brooklyn, N. Y. Filed June 28, 1891. Serial No. 64,316. (No model.)

Claim.—As a new article of manufacture, a match-box having flat side walls, and having on one flat side wall a projecting annular rim forming a picture-receiving compartment, a picture in said compartment, which has a flat back resting against the wall of the match-box and a convex face, and a cylindrical retaining-ring in engagement with the periphery of said rim and having an internal annular flange for engaging the cen-

terity of said picture and also having an external rim forming a means for handling the ring to remove it, substantially as shown and described.

697,602. METHOD OF ORNAMENTS. GEORGE W. BLAIR, Pittsburg, and FRANK G. BORN, Jeannette, Pa. Filed Oct. 28, 1891. Serial No. 70,000. (No specimens.)

Claim.—1. The method of ornamenting, consisting in making a transfer from the plate to the surface to be ornamented, dusting color upon this transfer, applying a second transfer embodying the same design over the dusted first transfer, and then reducing the second transfer with color, substantially as described.

2. The method of ornamenting, consisting in applying a plurality of overlaid transfers to the article and dusting the article with color after each transfer; substantially as described.

3. The method of ornamenting, consisting in taking a transfer from a plate which contains the outline and at least a part of the shade, applying this transfer to the surface to be ornamented, dusting on color, applying a second transfer which matches with the first, but contains a solid design with the high lights therein, and then reducing with color, and firing the article; substantially as described.

697,603. THILL-COUPLES. GEORGE W. C. BRADLEY, Syracuse, N. Y. Filed Feb. 20, 1892. Serial No. 84,000. (No model.)

Claim.—1. In a thill-coupling, the combination with the fixed and movable jaws and the tightening lever and spring, of a longitudinally-movable connection whereby the spring is attached to the movable jaw and the spring is enabled to change its position lengthwise with reference to the jaw and also is caused to open the jaw upon releasing the lever, substantially as set forth.

2. In a thill-coupling, the combination of a fixed jaw, a movable jaw provided with a transverse slot, a tightening-lever, and a tightening-spring which is operated by said lever and arranged with its free end in said slot and capable of lengthwise movement therein, substantially as set forth.

3. In a thill-coupling, the combination of a fixed jaw, a movable jaw provided with a transverse slot, a tightening-lever, and a tightening-spring which is attached to said lever and arranged with its free end portion in said slot and capable of lengthwise movement therein and which has its free end provided with a projection for opening the jaw, substantially as set forth.

697,604. MACHINERY FOR MANUFACTURING TUBE-BANDS. JOHN BRADLEY, Birmingham, England. Filed Aug. 28, 1891. Serial No. 72,673. (No model.)

Claim.—1. The improvements in machinery for manufacturing tube-bands consisting essentially of two carriers capable of traveling in reverse directions, a dog or gripper pivotally mounted in each carrier with means for operating or moving the dogs upon their pivots in the manner and for the purpose substantially as herein set forth.

2. In machines for making tube-bands, a pair of carriers capable of traveling in reverse directions, a dog or gripper pivotally mounted in each carrier, and quadrants and worms for operating said dogs, substantially as described.

3. In machines for making tubes, a pair of carriers, dogs or grippers mounted therein, and means for simultaneously moving said dogs or grippers and carriers, substantially as described.

4. In machines for making tubes, a pair of traveling carriers, dogs or grippers having quadrants and pivotally mounted in said carriers, an operating-shaft, worms keyed to said shaft and engaging the quadrants, and screw-shafts for operating said carriers in reverse directions, substantially as described.

697,604.

697,605. TYPE-WRITING MACHINE. LEO A. BURMAN, New York, N. Y. Filed Nov. 27, 1901. Serial No. 22,801. (No model.)

Claim.—1. An inking mechanism for type-writing machines comprising two rollers, one being relatively small and light, and constructed to be struck by the type mechanism, and to swing against the second roller which is relatively stationary and large, substantially as shown and described.

2. An inking mechanism for type-writing machines comprising two rollers, one having a stationary pivot, and the other a swinging pivot so constructed that the latter when struck by the type mechanism is caused to swing against the former, as set forth.

3. In a type-writing machine, the combination of a series of type-carriers, a platen, and two inking-rollers adjacent to the platen, so constructed that one of them is in the path of all the type-carriers, and when struck by a type-carrier is caused to strike against the other inking-roller, as set forth.

4. An inking mechanism for type-writing machines comprising two rollers, one having a series when struck by the type which causes it, by reason of momentum to go out of contact with the type and to strike the other roller which is relatively stationary, substantially as shown and described.

5. In a type-writing machine, the combination of an inking-roller constructed to swing when struck by a type-carrier, and a supply-roller constructed to act as a buffer and arrest the swinging motion of the inking-roller, substantially as shown and described.

6. In a type-writing machine, the combination of an inking-roller disposed in the path of the type-carrier and arranged to swing out of such path when struck by a type-carrier, and a supply-roller positioned at some distance away from the path of the type-carrier, as shown and described.

7. In a type-writing machine, the combination of an inking-roller constructed to swing when struck by a type-carrier, and a supply-roller relatively stationary and constructed to act as a buffer and arrest the swinging motion of the inking-roller, substantially as shown and described.

8. In a type-writing machine, the combination of type mechanism having a plurality of type in one line, with an inking-roller constructed to be struck by only one of the type and to swing against a supply-roller substantially as set forth.

9. In a type-writing machine, the combination of a type-carrier having a plurality of type in one line, with an inking-roller constructed to swing in a right-angled direction to the line of type, and to swing against a supply-roller, as set forth.

10. An inking mechanism for type-writing machines comprising a small roller and a relatively large roller together with type mechanism, all normally out of contact with each other, and so constructed that the type when operated strikes the small roller and takes the ink therefrom, and the latter strikes the large roller and takes the ink therefrom, as shown and described.

11. An inking mechanism for type-writing machines comprising an inking-roller positioned so as to be struck at approximately the same place by the type mechanism and ink the type, and a supply-roller constructed to be struck by the inking-roller and supply the latter with ink, substantially as shown and described.

12. In a type-writing machine, the combination of a type-carrier, a guide for said carrier at or near the printing-point, and an inking-roller approximately central with the guide and constructed to be struck by the type-carrier and to swing against a supply-roller, as set forth.

13. An inking mechanism for type-writing machines comprising an inking-roller secured in a swinging bracket, said bracket having a projection which connects it to a spring-pressed bracket; both brackets swinging around an extension of the same axis, substantially as shown and described.

14. In a type-writing machine, the combination of type-carriers with a swinging inking-roller and a stationary supply-roller; the axis of swinging roller being parallel with a line drawn from top to bottom of the type on the type-carrier.

697,606. COMBINED WATER AND FIRE TUBE STEAM-GENERATOR. THOMAS R. BUTMAN, Chicago, Ill. Filed June 24, 1901. Serial No. 60,898. (No model.)

Claim.—1. In a steam-boiler the combination of an upper and lower drum with a central water-pipe connecting the same, water-tubes surrounding the water-pipe and connecting the drums, and a series of fire-tubes passing through said upper drum.

2. In a steam-boiler the combination of an upper and lower drum with a central water-pipe connecting the same, continuous tie-rods extending through said central water-pipe and securing the upper and lower heads to each other, water-tubes surrounding the water-pipe and connecting the drums, and a series of fire-tubes passing through said upper drum from head to head.

3. In a steam-boiler the combination of an upper and lower drum with a central water-pipe connecting same, continuous tie-rods securing the two outer heads of the drums together, and straps secured to two or more of the tie-rods, forming a ladder for climbing into the upper drum.

4. In a steam-boiler the combination of an upper and lower drum with a central water-pipe connecting the same, and provided with a deflecting-plate *I* on its outside which also serves as a platform, a series of water-tubes surrounding said water-pipe and plate, said water-tubes being so arranged as to leave a space by which access may be had to the platform, and a door in the casing of the boiler for the purpose substantially as described.

5. In a steam-boiler the combination of an upper and lower drum, with a central water-pipe connecting the same, a series of water-tubes surrounding the water-pipe and connecting the drums, continuous tie-rods securing the two outer heads of the drums, and a haffle-plate in the lower drum secured to said tie-rods.

6. In a steam-boiler the combination of an upper and lower drum, with a central water-pipe connecting the same, a series of water-tubes connecting said drums outside of said pipe and a feed-water pipe which enters the lower drum, and passes up into the water-pipe, said feed-pipe being provided with a return bend or gooseneck directing the feed-water downwardly to assist in causing a rapid circulation of the water in the boiler as set forth.

7. In a steam-boiler the combination of an upper and lower drum with a central water-pipe connecting the same, tie-rods securing the two outer heads of said drums, water-tubes surrounding the central water-pipe and connecting the drums, and fire-tubes passing through the upper drum for the purpose set forth.

697,607. WOOD-TURNING MACHINE. WILLIAM J. COCHRAN, San Francisco, Cal. Filed Nov. 8, 1901. Serial No. 61,600. (No model.)

Claim.—1. In a wood-turning machine, the combination of a bench, a carriage movable longitudinally on the bench, a slide-rest on the carriage, overhanging the upper side of the bench, a slide held to and movable in and out on said rest, a tool carried by and movable with the slide, a shaft journaled in the carriage, and having arms connected with the slide, and also having a notched disk, a lever fulcrumed on the shaft and straddling the notched disk thereof, a rotatable, notched disk carried by the lever and disposed at right angles to the disk of the shaft, and means for adjustably fixing the slide with respect to the slide-rest.

2. In a wood-turning machine, the combination of a bench, a carriage movable longitudinally on the bench, a slide-rest on the carriage, overhanging the upper side of the bench, and having its upper side beveled or inclined downwardly and inwardly, a slide held to and movable in and out on and having its under side beveled in conformity to the upper side of the slide-rest, means for adjustably fixing the slide with respect to the slide-rest, a tool carried by the slide, a shaft journaled in the carriage and having arms connected with the slide, and also having a notched disk, a lever fulcrumed on the shaft and straddling the notched disk thereof, and a rotatable notched disk carried by the lever and disposed at right angles to the disk of the shaft.

3. In a wood-turning machine, the combination of a bench having the lower and upper beveled guide-bars on its front side, a carriage having portions engaging said guide-bars, gearing for moving the carriage carried thereby and engaging one of the guide-bars, a slide-rest on the carriage, overhanging the upper side of the bench and having its upper side beveled or inclined inwardly and downwardly, and also having a dovetail groove in said side, a slide arranged on and beveled in conformity with the slide and having a dovetail projection arranged in the groove thereof, a tool carried by the slide, means for fixing the slide with respect to the rest, a shaft journaled in the carriage, and having arms connected with the slide, and also having a notched disk, a lever fulcrumed on the shaft, and a rotatable notched disk carried by the lever and disposed at an angle to and adapted to engage the disk of the shaft.

4. In a wood-turning machine, the combination of a tool-holder, concave in cross-section, a concave tool in said holder, and a concave head secured on the holder and serving in conjunction with said holder and the tool to form a tubular chisel.

5. In a wood-turning machine, the combination of an upright, a concave tool-holder member fixed with respect to said upright and having interior and exterior shoulders *u* and *v* and a flange *y*, a concave tool-holder member adjustably connected with the upright and also having interior and exterior shoulders *u* and *v* and a flange *y*, a concave tool arranged in the tool-holder between the interior shoulders *u* of the members thereof, a concave head having its edges disposed on the exterior shoulders *v* of the tool-holder, and also having interior shoulders arranged on the flange *y* of the tool-holder members, and means for securing said head on the tool-holder.

6. In a wood-turning machine, the combination of a tool-holder, concave in cross-section, a concave tool in said holder, and a concave head secured on the holder and having the depending lip *m* at its rear or outer end.

7. In a wood-turning machine, the tubular chisel arranged to receive the chips as the same are cut, and having the deflecting-flap at its rear or outer end.

697,608. BELT-ADJUSTER. ANDREW COULDER, Miami, Fla. Filed Sept. 3, 1901. Serial No. 74,122. (No model.)

Claim.—1. In a belt-adjuster, the combination with a drive-shaft; and an adjusting-ring thereon; of a two-part sleeve on said ring and freely turnable on said shaft; a pin having an enlarged head, mounted on said sleeve, said head extending to the periphery of the shaft; a beveled bar carried by said sleeve; and a bifurcated rod adapted to engage with said pin.

2. In a belt-adjuster, the combination with a drive-shaft, and an adjusting-ring thereon; of a two-part sleeve on said ring, and freely turnable on said shaft; a headed pin on said sleeve, the head extending to the periphery of the shaft; a beveled bar carried by said sleeve; an arm-carrying bow attached to said bar, said bow having an arm bent toward the pulley; a connecting-arm, connecting said sleeve with the free end of said bow; and a bifurcated rod adapted to engage with said pin.

3. In a belt-adjuster, the combination with a drive-shaft; of a beveled bar freely turnable on said shaft; an arm-carrying bow attached to said bar and having an arm bent toward the pulley; and an arm extending from the opposite face of said bar from said bow, said latter arm having its end within the rim of the pulley.

697,609. MEANS FOR OPERATING TRAMWAY OR SIMILAR FUNDED FROM VEHICLE. WILLIAM A. DAY, Southport, England. Filed Dec. 21, 1901. Serial No. 80,300. (No model.)

Claim.—1. In a transway-switch, the combination with a switch-point, of a sliding rod connected therewith, a ball-socket lever having one arm connecting with said rod, a pressure-plate connected with the other arm, a rocking lever extending transversely of the rod-bed and having one end connected with said other arm of the ball-socket, and a pressure-plate connected with the opposite end of said lever, substantially as described.

2. In a transway-switch, the combination with the switch-point, of a transverse sliding rod connected to both points, a ball-socket in proximity to each rail having a vertical arm engaging said rod, and having a horizontal arm, a pressure-plate connected to each horizontal arm, and a rocking lever having its opposite ends connected with the horizontal arms of said ball-sockets, substantially as described.

WITHDRAWN.

697,610.

WITHDRAWN.

697,611. FIRE-EXTINGUISHING DEVICE. WILLIAM DELL, San Francisco, Cal. Filed May 22, 1901. Serial No. 61,000. (No model.)

Claim.—1. In a fire-extinguishing apparatus for buildings, the combination of a storage-tank located in the upper part of the building, a supply-pipe connecting said tank with the main water-supply outside the building, a pipe leading from said tank downwardly through the building and in close relation to the supply-pipe of the tank, a series of sprinkling devices, a branch pipe connecting each sprinkling device with the pipe leading down from the storage-tank and also with the supply-pipe connected with the main water-supply outside the building, a controlling-valve in the branch pipe operating to open and close connection between the branch pipes of the sprinkling device and both of said supply-pipes simultaneously, and means for operating said valve.

2. In a fire-extinguishing apparatus for buildings, the combination of a storage-tank, a pipe leading therefrom downward through the several stories of the building, a pipe connected with the main water-supply leading from the street-main upward through the several stories to the tank, branch pipes at every story at predetermined points tapped into both standing pipes, a series of sprinkling devices in each room, a controlling-valve having an operating-lever adapted to turn on or off the connection between the branch pipes and standing pipes, and means for operating said valves both separately and in groups, comprising the rock-shaft at every floor, and wires separately connecting the valve-levers with the rock-shaft, whereby the movement of the rock-shaft in one direction will open all the valves, and in the other direction will close them.

3. In a fire-extinguishing apparatus for buildings, the combination of a storage-tank, a pipe leading therefrom downward through the several stories of the building, a pipe connected with the main water-supply leading from the street-main upward through the several stories to the tank, branch pipes at every story at predetermined points tapped into both standing pipes, a series of sprinkling devices in each room, a controlling-valve having an operating-lever adapted to turn on or off the connection between the branch pipes and the standing pipes, and means for operating said valves both separately and in groups, comprising the rock-shaft at every floor, wires separately connecting the valve-levers with the rock-shaft whereby the movement of the rock-shaft in one direction will open all the valves and in the other direction will close them, and means

located outside the building to which said rock-shafts are connected by wires U' V' for operating said rock-shafts from the outside of the building.

4. In a fire-extinguishing apparatus for buildings, the combination of stationary sprinkling devices, a storage-tank, a water-pipe leading therefrom downward through the several stories of the building, a water-supply pipe leading upward from the street-main to the tank, branch pipes tapped into both water-pipes and connecting the sprinkling devices with the water-supply both of the street-main and the storage-tank, a controlling-valve in the connection between the branch pipe and the supply-pipe, having an operating-lever, and means connecting the lever of all the valves with operating devices outside the building, comprising the rock-shafts having arms to each valve, and wires connecting said arms of the valve-levers with the operating devices.

697,612. ACETYLENE-GAS GENERATOR. CHARLES E. BRACK, Ostrum, N. Y. Filed Dec. 17, 1902. Serial No. 68,105. (No model.)

Claim.—1. In an acetylene-gas machine the combination of a tank formed with a central well extending from the bottom to a point above the tank and surrounding annular chamber, of less depth than the central well, an annular chamber beneath the annular chamber first named, a cover fitted over the central well and projecting above the tank and forming with said well a generating-chamber, a generator-bell working in the annular chamber and guided by the cover, and means carried by said cover for applying carbide to the generating-chamber and means for conducting gas from the generating-chamber through the second-named annular chamber, to the bell, and from the bell to a point of consumption.

2. In an acetylene-gas apparatus the combination of a tank formed with a central well and with a surrounding annular well or chamber of less depth than the central well and with an annular chamber beneath the annular chamber first named, a cover fitting over the central well, forming therewith a generating-chamber and carrying means for delivering carbide into said generating-chamber, an annular bell working in the annular well or chamber surrounding the generating-chamber and guided by the walls of the latter, means for conducting gas from the generator into the annular chamber beneath the annular well, means for conducting the gas thence, and means for maintaining a water-level in the generating-chamber and annular well, and a separate water-level in the chamber beneath the well; substantially as set forth.

3. In an acetylene-gas apparatus the combination of a tank formed with a central generator-well and a surrounding annular generator-well, a cover and a bell, fitted respectively to the central and surrounding wells, a condensation-chamber surrounding the generator-well beneath the annular well, a water-supply pipe communicating with both the generator and generator wells, a water supply pipe communicating with and maintaining a water-level in the condensation-chamber, a gas-outlet extending from the generating-chamber above the water-level to a point beneath the water-level in the condensation-chamber, whereby water is retained below an objectionable level in the said gas-outlet, the gas-pipe 26 and 27, and means carried by the generator-cover for applying carbide.

4. In an acetylene-gas apparatus, the combination of a main tank formed with a central generator-well, a surrounding annular generator-well and a condensation-chamber beneath the generator-well, a cover forming with the generator-well a generating-chamber, and having means for applying carbide thereto, a bell forming with the generator-well a generator, and guided upon the generator, a partition in the condensation-chamber forming a drip-compartment therein, a pipe leading from above the water-level in the generator to a point beneath the water-level in the condensation-chamber, a pipe communicating from above the water-level in the condensation-chamber to a point above the water-level in the generator and a pipe leading from above the water-level in the generator to a point outside the machine and having an extension projecting below the water-level in the drip-compartment of the condensation-chamber.

5. In an acetylene-gas apparatus, the combination of a main tank formed with annular generator and condensation chambers, and with a central well projecting below both of said annular chambers, a cover and a bell fitted respectively to the well and to the generator-chamber, means carried by the cover for applying carbide to the central well, means for conducting gas from the generator to the generator and from the latter to a point outside the machine, and pipes for supplying and drawing off water extending into the central well beneath the annular chambers, substantially as set forth.

6. In an acetylene-gas apparatus the combination of a tank formed with central and annular wells of different depths, a cover extending to the bottom of the annular well and a bell fitted respectively to the central well and the annular well and forming therewith a generating-chamber and a generator, the bell being guided upon the cover, means for applying carbide, carried by said cover, and a connection between the carbide-supply means and the generator whereby the former is actuated by the latter.

7. In an acetylene-gas apparatus the combination of a tank formed with central and annular wells, a cover and a bell forming with said central and annular wells respectively, a generator and a generator, the generator-bell being guided by the generator, carbide-supply means located in the generator, a rock-shaft actuating said carbide-supply means, a lever mounted on the protruding end of said rock-shaft, and a connection between said lever and the generator-bell which surrounds the generator.

8. In combination with the generator of an acetylene-gas apparatus, a hopper for holding carbide provided with a discharge-opening, a rock-shaft extending transversely through to the hopper above the discharge-opening, a valve located a distance below the discharge-opening sufficient to prevent clogging by the carbide passing through the latter onto the burner and pendulous connections between the valve and the rock-shaft whereby the valve may be vibrated horizontally for the purpose herein set forth.

9. In combination with the generator of an acetylene-gas machine, a hopper for holding carbide therein, a horizontal support or valve located a distance beneath the discharge-opening of the hopper, a rock-shaft extending transversely to the hopper in a plane above the discharge-opening, a pendulous support from the rock-shaft to the support or valve, a lever mounted upon the end of the rock-shaft and carrying a counterpoise controlling the shaft and normally holding the support or valve in a position beneath the discharge-opening of the hopper and a connection between the light end of the lever and the generator of the acetylene-machine.

10. In an acetylene-gas apparatus the combination of a tank formed with central and annular wells, a cover and a bell forming with said central and annular wells respectively, a generator and a generator, the generator being guided by the generator, carbide-supply means located in the generator at all times at the point of discharge, a rock-shaft actuating said carbide-supply means, and means connecting said rock-shaft with the generator-bell.

697,618. GRASS-SEPARATOR. ALAN B. ELLIS, Minneapolis, Minn. Filed May 22, 1901. Serial No. 61,427. (No model.)

Claim.—In a grass-separator, the combination with a receptacle, of a water-supply pipe located at one side of the receptacle, and having its discharge and arranged in the lower end thereof, eyes control to the receptacle above, the discharge end of the water-supply pipe, and an in-

holding eye located in the receptacle above the discharge end of the supply-pipe, and comprising screw-ribs having terminal heads that detachably engage the eyes.

697,814. LOCK. ALAN B. FREDMAN, Mount Vernon, N. Y. Filed Mar. 12, 1901. Serial No. 61,670. (No model.)

Claim.—1. A lock comprising one or more drawers or sliding members; a table; panels or slides located above said table and provided with grooves; a sliding top working in said grooves; and locking means for said drawers or drawers and having a part thereof projecting through said table and into one of said grooves at the forward part thereof and in position to be directly engaged and positively operated by a part of said top on the drawing forward thereof, thereby to lock said drawer or drawers closed.

2. A lock comprising one or more sets of drawers or sliding members; a table; panels or slides located above said table and provided with grooves; a roll-top working in said grooves; locking means for each set of said drawers and having a part thereof projecting through said table and into one of said grooves at the forward part thereof and in position to be directly engaged and positively operated by the roll-top on the drawing forward thereof, thereby to lock said drawers closed; and means for returning said locking means to its normal position.

3. A lock comprising one or more drawers or sliding members each having a recess adjacent to its forward end; a table; panels or slides located above said table and provided with grooves; a roll-top working in said grooves; locking means for said drawer or drawers and comprising a bar having a part thereof projecting through said table and into one of said grooves at its forward end and in position to be directly engaged and positively operated by the roll-top on the drawing forward thereof, said bar having a laterally-projecting arm or arms co-operating with said recess or recesses; and means for returning said bar to its normal position.

4. A roll-top lock comprising a table; panels or slides located above and below said table; guide-grooves in said upper panels; a roll-top working in said grooves; one of said lower panels having a groove; an opening in said table communicating with a groove in one of said upper panels and with the groove in said lower panel; a drawer having a downwardly-extending recess; a sliding bar adapted to work in the lower panel-groove and provided with an arm to enter the recess in said drawer, the upper end of said bar being in position to be engaged by said sliding top on the drawing forward thereof.

5. A lock comprising one or more drawers or sliding members each having a cam-shaped recess in the side thereof; a table carrying panels or slides provided with grooves; a roll-top working in said grooves; and locking means for said drawer or drawers and having a part thereof projecting into one of said grooves and in position to be engaged and operated by the roll-top on the drawing forward thereof, thereby to lock said drawers closed, said locking means having one or more laterally-extending projections co-operating with said cam-shaped recess or recesses.

6. A lock comprising a table; one or more drawers below the same each having a recess adjacent to its forward end; slides or panels supported by said table and provided with grooves; a top working in said grooves, said table having an opening communicating with one of the grooves in said panels; a bar located at the side of said drawer or drawers and having its upper end projecting through said opening in the table and into said groove and provided with an arm or arms adapted to engage said drawer or drawers when said bar is depressed by the roll-top on the drawing forward thereof, the organization being such that when any one of the drawers is open so that one arm is out of register with its recess the

bar cannot be depressed by the engagement of the top therewith, whereby the bar acts to maintain the top in a partially-closed position.

7. A roll-top lock comprising a table; two sets of drawers, each drawer having a recess; slides or panels above said table having grooves; side panels below said table also having grooves, said table having a pair of openings communicating with the grooves in said panels; a top sliding in said upper panel-grooves; bars located in the lower panel-grooves at the sides of said drawers and normally projecting above said table and into the grooves for the top and having arms adapted to enter said recesses when the bars are depressed by the top on the drawing forward thereof.

8. A roll-top lock comprising a table; two sets of drawers, each of said drawers having a recess; slides or panels above said table having grooves; slides or panels below said table also having grooves, said table having a pair of openings communicating with the grooves in said panels; a top sliding in said upper panel-grooves; bars located in the lower panel-grooves at the sides of said drawers and normally projecting above said table and into the grooves for the top and having arms adapted to enter said recesses when the bars are depressed by the top on the drawing forward thereof; and means for returning said bars to their normal position.

9. A lock comprising a table; one or more drawers below the same; slides or panels supported by said table and provided with grooves; a top working in said grooves; and means in position to engage said top and prevent the closing thereof when one or more of the drawers are open, said means comprising a bar having its upper end projecting into one of said grooves and provided with a projection or projections in position to engage said drawer or drawers.

10. A lock comprising a table; one or more drawers below the same; slides or panels supported by said table and provided with grooves; a top working in said grooves; and means in position to engage said top and prevent the closing thereof when one or more of the drawers are open, said means comprising a bar having its upper end projecting into one of said grooves and provided with a projection or projections in position to engage said drawer or drawers; and means for raising said bar.

11. A lock comprising a table; one or more drawers below the same; slides or panels supported by said table and provided with grooves; a top working in said grooves; means in position to engage said top and prevent the closing thereof when one or more of the drawers are open, said means comprising a bar having its upper end projecting into one of said grooves and provided with a projection or projections in position to engage said drawer or drawers; and means for raising said bar.

697,815. HAND CHIPPING-KNIFE. ALAN A. FLANN, Jefferson, Va. Filed May 12, 1901. Serial No. 61,104. (No model.)

Claim.—1. A hand chipping-knife comprising a bar provided with a suitable radially or laterally extending handle, and a plurality of cutting-blades pivotally mounted, at intervals, in said bar and extending in a direction opposite said handle.

2. A hand chipping-knife comprising a bar provided with a laterally-extending handle, a plurality of cutting-blades provided with curved-throated cheeks, said cheeks being pivotally mounted in said bar, and clamping-nuts on said cheeks, whereby said knives are adapted to be pivotally adjusted and secured in adjusted position.

697,816. KNITTING-MACHINE. JOHN J. FRANK, Orléans, Pa. Filed Nov. 21, 1900. Serial No. 57,908. (No model.)

Claim.—1. An attachment for circular-knitting machines comprising a series of transducers arranged in a circle and movable radially, and means for shifting them radially as a whole to take loops off of the fabric and return them to the needles and thereby form a seamless web, substantially as described.

2. A circular-knitting machine provided with a series of transducers and means for shifting the same radially in respect to the needles and vertically in respect to the same, substantially as described.

3. The combination of a carrier, transducers mounted to move radially of the carrier, means for shifting the carrier and transducers, and means for shifting the transducers in respect to the carrier, substantially as described.

4. A transducer having a tiltable and flexing disc with an open

slot between them through which a needle can enter laterally, and said times having catches for engaging a loop, substantially as described.

5. The combination of a carrier, transverse carrier by and movable radially of the carrier, cam, a part for shifting the transverse, and link-work interposed between the last-mentioned part and one of the cams and between the carrier and the other of the cams, substantially as described.

6. The combination of a carrier, transverse carrier by and movable radially of the carrier, cam, a part for shifting the transverse, link-work interposed between the last-mentioned part and one of the cams and between the carrier and the other of the cams, and mechanism for automatically driving and reversing said cam, substantially as described.

7. The combination of a circular carrier provided with radial grooves, transverse movable in said grooves, a cam or frustum adapted to shift the transverse in one direction, means for shifting the transverse in the other direction, and mechanism for operating said parts, substantially as described.

697,617. WRAPPING-MACHINE. GEORGE L. GAY, Spokane, Wash. Filed Apr. 24, 1901. Serial No. 57,129. (No model.)

Claim.—1. A wrapping-machine comprising a driving-crank, a reciprocating part operated by the crank, mechanism engageable with and rotated by the stroke of the reciprocating part in one direction but idle during the reverse stroke thereof, rotating folders operated by said intermittently-acting mechanism, spring-pressed formers spanning and yieldingly clamped against the folders, mechanism for withdrawing the folders longitudinally of the formers, feeding-cylinder for conveying a paper sheet or pam-

phlet and the wrapping material therefor between the folders, and pasting mechanism mounted within one of the feed-cylinders and adapted to apply an adhesive to the detached end of the wrapper through an opening in the periphery of the cylinder, substantially as and for the purpose specified.

2. In a wrapping-machine the combination of a driving-crank and pinion, a rack vibrated by the pinion, pawl-and-ratchet mechanism operated by the rack by its movement in one direction but disconnected on the reverse movement thereof, lengthwise-movable, rotatable folders intermittently revolved by said ratchet mechanism, pressure-plates or formers spanning and yieldingly clamped against the folders, mechanism for retracting the formers by the rotation of the driving-crank, a continuously-rotating feed-cylinder driven in unison with the driving-crank and having an opening in its periphery, pasting mechanism carried within the cylinder and adapted to deliver an adhesive to the wrapping material through the said opening, a continuously-rotating segment driven in unison with the pasting feed-cylinder and provided with differential friction-pads for unequally conveying the paper to be folded and the wrapping material and feeding the paper ahead of the wrapper, and a cutter for covering the wrapping material back of its pasted surface, substantially in the manner and for the purpose specified.

3. In a wrapping-machine the combination of a driving-crank and pinion, a rack vibrated by the pinion, a pinion rotated alternately in reverse directions by the vibration of the rack, ratchet mechanism rotated by the pinion in one direction and releasable in the reverse direction, gears intermittently rotated by the ratchet mechanism, wrapping plates or folders mounted to slide in said gears lengthwise of their axial line and driven by the rotation of the gears, spring-actuated formers spanning and yieldingly clamped against the folders, cam carried by the crank-shaft, lever connections operated by the cam to withdraw the folders from between the formers, and feeding mechanism for conveying a paper or pamphlet and wrapping-material between the folders, substantially as and for the purpose specified.

4. In a wrapping-machine the combination of a driving-crank and pinion, a rack vibrated by the pinion, a pinion rotated alternately in reverse directions by the vibration of the rack, ratchet mechanism rotated by the pinion in one direction and releasable in the reverse direction, gears intermittently rotated by said reciprocating mechanism, ball-bearings supporting said intermittently-rotating gears and adapted to contain the inward axial thrust thereof, wrapping-plates or folders mounted to slide in said gears lengthwise of their axial line, and driven by the rotation of the gears, yielding formers spanning and clamped against the folders, mechanism for withdrawing the folders from between the formers and feed mechanism for conveying a paper or pamphlet between the folders, substantially in the manner and for the purpose specified.

5. In a wrapping-machine the combination of the intermittently-rotating folders movable longitudinally of their axis of revolution, the yielding pressure-plates or formers spanning the same, mechanism for withdrawing the folders from the plane of the formers, a continuously-rotating feed-cylinder having an opening in its periphery, pasting mechanism carried within the cylinder and adapted to deliver an adhesive to the wrapper through said opening, a continuously-rotating segment revolving in unison with the pasting-cylinder provided with differential friction-pads for unequally conveying the paper to be folded and the wrapping material, a knife or cutter carried by the segment, an incline or chute for conveying the paper or pamphlet between the rolls, a gate for holding the paper upon the incline, tripping mechanism for lifting the gate to drop the paper to the feed-rolls, and checking mechanism for preventing the backward slip of the wrapper over the pasting-cylinder.

6. In a wrapping-machine the combination of the intermittently-rotating folders movable longitudinally of their axis of revolution, the yielding pressure-plates or formers spanning the same, mechanism for withdrawing the folders from the plane of the formers, a feed-cylinder having an opening in its periphery, pasting mechanism carried within the cylinder and adapted to deliver an adhesive to the wrapper through said opening, a segmental feed-roll revolving in unison with the pasting-roll, a knife or cutter carried by the segmental roll, mechanism provided with a series of teeth carried by the pasting-roll adapted to lift the wrapping material from the surface of the cylinder after feeding through the rolls, and a stationary comb fixed in the revolving path of the said clearing mechanism with its spaces adapted to permit the rotation of the teeth of the clearing mechanism through the same, to deposit the leading end of the wrapping material on the comb, substantially in the manner and for the purpose specified.

7. In a wrapping-machine the combination of the intermittently-rotating folders movable longitudinally of their axis of revolution, the yielding pressure-plates or formers spanning the same, a feed-cylinder having an opening in its periphery and journaled at one end upon a stationary shaft, a paste-receptacle supported within the cylinder and held stationary by said fixed shaft, a pasting-roll journaled in said receptacle and pro-

vided with a gear, a gear carried by the cylinder intermeshing with said roll-gear, a pasting-belt carried by the pasting-roll and a roll hung within the receptacle and the paste-belt to maintain the tension of the belt, substantially as and for the purpose specified.

8. In a wrapping-machine the combination of the intermittently-rotating rollers movable longitudinally of their axis of revolution, the yielding pressure-plates or frames spanning the same, a feed-cylinder having an opening in its periphery and journaled at one end upon a stationary shaft, a paste-receptacle supported within the cylinder and held stationary by the said feed shaft, an elliptical pasting-roll journaled in the upper edge of the said receptacle adapted to revolve past the opening in the cylinder, a weighted roll revolved in the bottom of the receptacle, a pasting-belt carried upon the said roll, a gear concentrically mounted and carried within the cylinder, and a gear intermeshed therewith mounted on the elliptical-roll shaft, substantially in the manner and for the purpose specified.

9. In a wrapping-machine the combination of the intermittently-rotating rollers, the yielding frames spanning the same, a pasting-cylinder journaled at one end upon a stationary shaft and mounted upon a revolving shaft at the opposite end, a paste-receptacle held within the cylinder and supported by the stationary shaft, pasting mechanism supported by the receptacle and rotated by the cylinder, a gear carried with the cylinder, a segmental roll geared therewith to feed with the paste-cylinder, and a knife or cutter carried by the segmental roll and adapted to cover the wrapping material fed between the rolls, substantially in the manner and for the purpose specified.

10. In a wrapping-machine the combination of a continuously-revolving feed-cylinder having an opening in its periphery, pasting mechanism supported within the cylinder, a segmental feed-roll geared therewith, a knife or cutter carried by the segmental roll and an elastic pressure-pad carried by the segmental roll in advance of and in juxtaposition to the knife and adapted to press the detached end of the wrapping material upon the pasting-belt after emergence from the roll, substantially as and for the purpose specified.

11. In a wrapping-machine the combination of intermittently-rotating rollers movable longitudinally of their axis of revolution, a pair of vibrating frames spanning the rollers and connected at points intermediate of their centers of suspension, whereby the movements of the frames are reciprocal and opposite, and a spring for compressing the plates, substantially as and for the purpose specified.

12. In a wrapping-machine the combination of a pair of wrapping-plates or frames suspended and adapted to swing upon rolls of different lengths, the plate of shorter radius having a spring bearing upon the ends of the plate of longer radius intermediate of the centers of suspension of the said plates, and means for automatically compressing the plates, substantially in the manner and for the purpose specified.

13. In a wrapping-machine the combination of the intermittently-rotating rollers, the yielding frames spanning the same, a pasting-cylinder having a pasting-opening in its periphery and journaled at one end upon a stationary shaft, and mounted upon a revolving shaft at the opposite end, a paste-receptacle held within the cylinder and supported by said stationary shaft, pasting mechanism supported by the receptacle and adapted to convey the adhesive to the peripheral opening of the cylinder and a segmental feed-roll adapted to feed contact with the cylinder, and driven in rotation therewith, substantially in the manner and for the purpose specified.

697,618. HYDROCARBON VAPORIZER OR BURNER. LAWRENCE C. GERRARD and JAMES H. ROWLEY, Buffalo, N. Y. Filed Dec. 4, 1899. Serial No. 33,001. (No model.)

Claim.—1. In a vaporizer, a vaporizing-chamber, an admission-passage thereto, and two discharge-passages therefrom adapted to conduct the vapor to the vaporizing and main burners respectively, and a check-valve in the main-burner passage opening outward from said vaporizing-chamber.

2. In a vaporizer, a vaporizing-chamber, an admission-passage thereto, and two discharge-passages therefrom adapted to conduct the vapor to the vaporizing and main burners respectively, and means in the main-burner passage resisting the discharge of vapor therefrom so as to insure that the first vapor generated shall pass to the vaporizing-burner.

3. In a hydrocarbon-vaporizer, the combination with a member comprising a main portion B recessed on one face, of a pair of diaphragms F F' removably attached to said recessed face and with a space between them so as to form with said recessed face and with each other a double vaporizing-chamber.

4. In a hydrocarbon-vaporizer, the combination with a member comprising a main portion B recessed on one face, of a pair of thin metal diaphragms F F' removably attached to said recessed face and with a space between them so as to form with said recessed face and with each other a double vaporizing-chamber.

5. In a hydrocarbon-vaporizer, the combination with a member comprising a main portion B having on one face a long groove, of a pair of diaphragms F F' removably attached to said grooved face and having a space between them so as to form with said recessed face and with each other a double vaporizing-chamber composed of a long passage C' and a large chamber B.

6. In a hydrocarbon-vaporizer, the combination with a member comprising a main portion B having on one face a long groove, of a diaphragm F' forming with said grooved face a long passage C', a diaphragm F spaced apart from said diaphragm F' and forming therewith a large chamber B, and a ring G holding said diaphragms removably attached in position.

697,619. TELEGRAPH-CONSIDER. GEORGE A. GANN, Duxbury, Mass.; assignor to John S. Wright, Duxbury, Mass. Filed Apr. 16, 1899. Serial No. 33,001. (No model.)

Claim.—1. In a telegraph-consider, two sounding-drums, a horizontal wire, a hammer fast to and suspended from said horizontal wire between said sounding-drums; in combination with a telegraphic relay, an armature-lever in said relay, and a wire joining said armature-lever and said hammer.

2. In a telegraph-consider, two sounding-drums, a horizontal wire, a hammer fast to and suspended from said horizontal wire between said sounding-drums; in combination with a telegraphic relay, an armature-lever in said relay, a wire joining said armature-lever and said hammer, and means for adjusting said hammer with relation to said armature-lever.

3. In a telegraph-consider, two sounding-drums, a horizontal wire, a hammer fast to and suspended from said horizontal wire between said sounding-drums, and means for adjusting said drums with relation to said hammer; in combination with a telegraphic relay, an armature-lever in said relay, a wire joining said armature-lever and said hammer, and means for adjusting said hammer with relation to said drums without changing the location of said armature-lever with relation to the magnets of said relay.

697,620. FURNACE. WILLIAM E. GANN, Duxbury, John S. Wright, Duxbury, and GEORGE A. GANN, Duxbury, Mass. Filed Feb. 20, 1899. Serial No. 33,001. (No model.)

Claim.—1. A fuel-carrying gate provided with retarding means for offering resistance to the progressive movement of the fuel on the gate, said means being constructed to permit the passage of air therethrough.

2. A fuel-carrying gate provided with a transversely-arranged dam of open-work construction offering resistance to the progressive movement of the fuel on the gate.

3. A fuel-carrying gate provided with a transverse dam of open-work construction having an inclined surface which rises from the gate and which offers resistance to the progressive movement of the fuel resting thereon.

4. The combination with a fuel-carrying gate of a transverse dam located in the path of the fuel on the gate, said dam being constructed to afford a supply of air through said dam to the fuel resting thereon.

5. The combination with a fuel-carrying gate, of a transverse dam of open-work construction located in the path of the fuel, said dam rising obliquely upward from the gate at its side toward which the fuel moves.

6. The combination with a fuel-carrying grate, of a transverse dam of open-work construction located in the path of the fuel, said dam consisting of two oppositely-inclined parts, the forward one of which rises from the grate-surface, and the rearward one of which projects over the ash-pit.

7. The combination with a fuel-carrying grate, of a transverse dam located in the path of the fuel, said dam consisting of two oppositely-inclined parts, the forward one of which rises from the grate-surface, and the rearward one of which projects over the ash-pit, said dam being formed to afford a plurality of air-spaces extending therethrough to provide for passage of air upwardly through the dam.

8. The combination with a fuel-carrying grate, of a transverse dam located in the path of the fuel, said dam rising obliquely upwardly from the grate-surface, and being constructed of a plurality of longitudinally-arranged bars, separated by spaces to permit the passage of air upwardly between the same.

9. The combination with a fuel-carrying grate, of a transverse dam located in the path of the fuel, said dam rising obliquely upwardly from the grate-surface, and being constructed of a plurality of parts separated to permit the passage of air upwardly between the same and some of which are movable for agitating the fuel.

10. The combination with a fuel-carrying grate, of a transverse dam consisting of a plurality of separate bars provided with two angularly-disposed arms, and means for supporting said bars above the grate, said bars being constructed to form, when assembled, oppositely-inclined surfaces, one of which rises from the grate, and the bars being separated by spaces to afford air-passages between the same.

11. The combination with a fuel-carrying grate, of a transverse dam consisting of a plurality of bars provided each with two angularly-disposed arms separated to provide air-spaces between the same and means for supporting said bars above the grate, said bars being constructed to form, when assembled, two oppositely-inclined surfaces, one of which rises from the grate, some of said bars being vertically movable.

12. The combination with a fuel-carrying grate, of a transverse dam consisting of a plurality of independent bars each provided with two angularly-disposed arms separated to provide air-spaces between the same, and a girder supporting said bars above the grate, said bars being constructed to form two oppositely-inclined surfaces one of which rises from the grate, some of said bars being movably supported on the said girder.

13. The combination with a fuel-carrying grate, of a transverse dam, embracing a plurality of bars having angularly-disposed arms, a girder located transversely over the grate for supporting said bars, said bars constituting oppositely-disposed inclined surfaces, the forward one of which rises from the grate, and complementary curved bearing-surfaces on the bars and girder, the curved surfaces of the bars constituting arcs of circles whose centers coincide with the points of engagement of the bars with the grate.

14. The combination with a fuel-carrying grate, of a transverse dam

embracing a plurality of bars, a girder located transversely over the grate for supporting said bars, a portion of said bars being movable with respect to, and having interlocking connection with the girder, and means for actuating said movable bars.

15. The combination with a fuel-carrying grate, of a transverse dam embracing a plurality of bars, a girder located transversely over the grate for supporting said bars, some of said bars being movable in vertical planes and means for actuating the movable bars, said girder and the movable bars having complementary curved guiding-surfaces.

16. The combination with a fuel-carrying grate, of a transverse dam comprising a plurality of bars each consisting of two angularly-disposed arms, a girder located transversely over the grate and engaging said bars at the angle thereof to support the same, said bars being separated to provide air-spaces between the same, and the girder being of open construction to provide air-passages therethrough.

17. The combination with a furnace and a grate therein constructed to carry the fuel therethrough during combustion, of a transverse dam of open-work construction located in the path of the fuel for retarding the movement of said fuel, and a damper located between the discharge end of the grate and the ash-pit.

18. The combination with a furnace and a grate therein constructed to carry the fuel therethrough during combustion, of a transverse dam composed of two oppositely-inclined parts of open-work construction, one of which rises upwardly from the grate-surface, and the other of which overhangs the ash-pit of the furnace, and a damper located between the discharge end of the grate and the ash-pit.

19. The combination with a furnace and a grate therein constructed to carry the fuel therethrough during combustion, of a transverse dam of open-work construction which overhangs the ash-pit of the furnace, and a damper-plate which is supported from the furnace-wall to swing toward and from said dam and which tends to rest by gravity against the rear part of said dam.

20. The combination with a furnace and a grate therein constructed to carry the fuel therethrough during combustion, of a transverse dam of open-work construction which overhangs the ash-pit of the furnace, a damper-plate, a hinge-plate embedded in the wall of the furnace and provided with hooks on which said damper-plate is suspended said damper-plate being adapted to swing toward and from the dam and tending by the action of gravity to rest against said dam.

21. The combination with a fuel-carrying grate, of a transverse dam comprising a plurality of bars having angularly-disposed arms, a girder located transversely over the grate for supporting said bars, some of said bars being movable and the other stationary, and lateral projections on said movable bars adapted for engagement with the lower margins of the stationary bars.

22. A fuel-carrying grate provided with a transverse dam which rises from the grate and affords a resistance to the progressive movement of the fuel on the grate, said dam having a limited upward and rearward movement.

23. The combination with a furnace, of a fuel-carrying grate, provided with a transverse dam which rises obliquely upward from the surface of the grate, and embracing a girder supported in walls of the furnace, said girder having a limited rearward and upward movement.

24. The combination with a furnace, of a fuel-carrying grate, provided with a transverse dam which rises obliquely upward from the surface of the grate and embracing a girder supported in the walls of said furnace, stationary blocks embedded in the walls of the furnace having oblique upper surfaces, and movable blocks directly supporting said girder and resting on said oblique surfaces of the stationary blocks.

25. A fuel-carrying grate provided with a transverse dam of open-work construction which rises from the surface of the grate with its rear end extending over the ash-pit of the furnace and a lower dam located between the first-mentioned dam and the fuel-receiving end of the grate.

26. The combination with a fuel-carrying grate, of a transverse dam located in the path of the fuel, said dam rising obliquely upwardly from the grate-surface and having spaces for the passage of air therethrough, and a steam-pipe located in position to direct jets of steam at or near the forward end of said dam.

27. The combination with a traveling grate the fuel-supporting surface of which is formed by pivotally-connected link-bars and which passes over supporting-wheels at the rear end of the grate, of a dam embracing a plurality of bars some of which are movable and means for moving the said bars comprising arms on the bars located in position for engagement with link-bars of the grate so said link-bars pass over said supporting-wheels.

697,621. FURNACE VEHICLE-TIRE. ROBERTSON COMPANY, Inventor, R. I., assignor, by mesne assignments, to the American Rubber Works Company, a Corporation of New Jersey. Filed Jan. 4, 1906. Serial No. 32,571. (No model.)

Claim.—1. A pneumatic rubber tire provided with lateral thrust-weight-carrying ribs, projecting from its sides, said ribs being located in a position to carry a part of the load and to receive the lateral thrust of the tire directly under the edges of the wheel-rim, leaving a non-contacting space, between the upper side of the said ribs and the top center of the tire substantially as described.

2. A pneumatic rubber tire provided with lateral thrust-weight-carrying ribs, a, located one on each side of the tire directly under the edge of the wheel-rim leaving a non-contacting space between the upper side of the said ribs, and the top center of the tire, said ribs constructed of soft yielding rubber to permit of compression under the wheel-rim, thereby creating a greater lateral expansion in the tire substantially as described.

3. The combination of a wheel-rim with a pneumatic tire provided with projecting longitudinal weight-carrying ribs, a, one on each side leaving a non-contacting space between the said ribs and the top center of the tire, the rim being so formed as to rest on the upper center of the tire and the two weight-carrying ribs, the latter preventing the edge of the rim from coming in contact with the side of the tire when compressed substantially as described.

697,622. SHEET-METAL BOX OR CAN. ROBERT F. GUNTER, Fitchley, and WALTON R. HORN, London, England. Filed Dec. 21, 1901. Serial No. 55,221. (No model.)

Claim.—1. A sheet-metal box or can, comprising a body-piece rolled into cylindrical form, projecting pieces at two opposite edges of said body-piece, a solderless liquid-tight folded seam uniting said projecting pieces to form the can-body, overlapping edges forming continuations of said seam in both directions, flexible metal making said overlapping edges, flanges on the two ends of said can-body, and end pieces secured to said flanges, substantially as described.

2. The method of making sheet-metal boxes or cans, consisting in forming notches in the corners of a body-piece of sheet metal so as to form projections at opposite edges of said body-piece, rolling said body-piece into a cylindrical form, uniting said projections by a solderless liquid-tight multiple-fold seam to form the can-body, flanging the ends of said can-body, striking said seam along its whole length, uniting by flexible metal the overlapping edges of said body-piece beyond said seam, forming head or top and bottom pieces for the can-body, and securing said pieces to the body, substantially as described.

3. A can-body comprising a body-piece of sheet metal rolled into cylindrical form, projecting pieces at two opposite edges of said body-piece, a solderless liquid-tight folded seam uniting said projecting pieces, flanges at the ends of said body, overlapping edges at the ends of said seam, and solder uniting said overlapping edges, substantially as, and for the purpose, hereinbefore described.

697,623. PRESSURE-GAGE. FRANK E. HANKEL, Boston, Mass. Filed Jan. 17, 1902. Serial No. 55,197. (No model.)

Claim.—1. In a pressure-gage, the combination with a Bourdon spring-tube extending around approximately three-fourths of a circle; of a tube-supporting socket; a shaft-supporting stand formed in one piece with said socket; an index-carrying shaft; a pinion mounted on said shaft; a rack engaging said pinion; a rack-operating lever fulcrumed in near proximity to said socket; and a rod having one end pivoted directly to the movable end of said spring-tube and its other end pivoted to said lever between its fulcrum and its movable end.

2. In a pressure-gage, the combination with a Bourdon spring-tube extending around approximately three-fourths of a circle; of a spring-tube-supporting socket; a shaft-supporting stand, formed in one piece with said socket, the outer end of said stand being provided with a threaded hole therein of greater diameter than said shaft; a shaft provided with

shouldered journals, and mounted in said stand; a threaded tubular bearing fitted to the threaded hole in said outer end and forming a bearing for the outer journal of said shaft; a rack-operating lever mounted on said shaft; and a rod pivoted at one end to the movable end of said spring-tube, and at its other end to said lever between its fulcrum and its movable end.

3. In a pressure-gage, the combination with a Bourdon spring-tube, a socket for supporting the same, a dial, an index-finger, its spindle, a pinion mounted on said spindle, and a rack and lever for rotating said spindle, of a flexible connection between the movable end of the Bourdon spring and said pinion-operating lever, the ends of said flexible connection being rigidly clamped one to said spring, and the other to said lever.

4. In a pressure-gage, the combination with an index-finger, its spindle, a pinion mounted on said spindle, a Bourdon spring-tube its supporting socket and stand, a lever mounted in bearings in said stand, and a reciprocating rack operated by said lever, of the plate 13 firmly secured to the movable end of said spring, and provided with the dotted stud 14, and the clamping-screw 15; the two-armed plate 21, adjustably secured to the rack-operating lever; the dotted plate 17 adjustably secured to the plate 21, and provided with the dotted stud 18 and the clamping-screw 19; and the flexible connection 16, provided with an eye at each end to receive the clamping-screws 15 and 19, said flexible connection, being engaged by the dotted studs 14 and 18, in near proximity to the clamping-screws 15 and 19 respectively.

5. In a pressure-gage, the combination with a Bourdon spring-tube, its supporting-socket, and a shaft-supporting stand, a lever fulcrumed in said stand, a connection between the movable end of said spring-tube and said lever; an index-finger, and its spindle, of a pinion provided with teeth having rounded outer ends; and a reciprocating rack provided with V-shaped teeth with the spaces between said teeth curved to rest of circles to rest upon the rounded outer ends of said pinion-teeth, said rack being pivoted by one end to the movable end of said lever; a stop to limit the upward movement of said rack at its point of contact with said pinion; and a spring carried by said lever and bearing upon the upper side of said rack to press it into contact with the teeth of said pinion.

6. In a pressure-gage the combination with a Bourdon spring-tube, its supporting socket and stand, a lever fulcrumed in said stand, a connection between the movable end of said spring-tube and said lever, an index-finger, and its spindle, of the pinion 24 provided with teeth having rounded ends; and the reciprocating rack 26 provided with V-shaped teeth with the spaces between said teeth curved to the arc of a circle, and its upper surface curved longitudinally to compensate for the rise and fall of its pivoted end, due to the arc described by the movable end of its operating-lever.

697,624. PHOTOGRAPHIC CAMERA. HENRY E. HENCK, Great Yarmouth, England. Filed Oct. 14, 1901. Serial No. 71,022. (No model.)

Claim.—1. A photographic camera consisting of three compartments, two of which are made in one piece and have a common sliding back provided with a shallow recess for holding a plate, a focusing-screw and a movable shelf to drop the exposed plate out of the camera, one of these two compartments being fitted to contain a number of reserve plates which are spring-pressed against the sliding back, the other compartment being provided with an adjustable lens and blinged shutter, and a third compartment provided with two vessels one containing a developing solution and the other a fixing solution the former vessel lying close under the movable shelf in the position occupied when a plate is exposed, substantially as described and shown.

2. A photographic camera consisting of three compartments two of which are made in one piece with a common sliding back fitted with a

movable shelf, one of these two compartments being a magazine of reserve plates and the other a camera proper, these two compartments being hinged to the third compartment so that the two compartments may be turned through a right angle relatively to the third and rigidly secured in that position by a folding bracket, and in the other position to substitute that the movable shelf, when withdrawn, will permit a plate, in the compartment forming the camera proper, to drop into the third compartment which will then be light-tight substantially as described and shown.

697,625. PIPE-LIFTING MECHANISM. ALVIN HOSKINS, Calmar, Iowa. Filed Aug. 12, 1901. Serial No. 93,101. (No model.)

Claim.—1. In pipe-lifting mechanism, the combination of a frame, a lifting-lever secured thereto, clutches secured to said lever, means for adjusting said clutches at different points along said lever, a guide-rod secured in said frame, a guide secured in said frame below said guide-rod, a guide at the top of said guide-rod, an adjustable friction-actuator secured on said guide-rod for the purpose of holding the lifted pipe, substantially as described.

2. In pipe-lifting mechanism, the combination of a frame, a lifting-lever secured thereto, a guide-rod secured thereto, a guide at the top of said guide-rod, an adjustable friction-actuator secured on said guide-rod, adjustable clutches secured to said lifting-lever, and means for adjusting said clutches at variable distances from the fulcrum of said lever, substantially as described.

3. In a pipe-lifting machine, the combination of the frame a lifting-lever secured thereto clutches secured thereto, provided with an opening between the two sections thereof, a threaded pin in the ends of said sections, a stop-block on the shorter section extending across and over and adapted to engage the longer section, the whole arranged whereby the opening between said sections is adjusted by revolving the shorter section, substantially as described.

697,626. RUBBER VEHICULAR-TIRE. FRANK E. HYDE, Toronto, Canada. Filed Aug. 12, 1901. Serial No. 73,302. (No model.)

Claim.—1. The combination with a wheel having a felly and a metallic tire provided with coincident apertures; of the rubber tire, the apertured metallic band arranged at the inner side of the rubber tire and on

the exterior periphery of the metallic tire of the wheel, and the headed, laterally-threaded nuts extending through the apertures of the metallic band and resting in the apertures of the metallic tire of the wheel; said rubber tire, metallic band and nuts being vulcanized together, and headed and threaded bolts extending through the apertures of the wheel-felly and engaging the laterally-threaded nuts.

2. The combination with a wheel having a felly and a metallic tire provided with coincident apertures; of the rubber tire, the apertured metallic band arranged at the inner side of the rubber tire and on the exterior periphery of the wheel-tire and having one of its ends extended beyond the adjacent end of the rubber tire and exteriorly beveled, and its other end arranged in rear of the adjacent end of the rubber tire and laterally beveled, and the headed, laterally-threaded nuts extending through the apertures of the metallic band and resting in the apertures of the metallic tire of the wheel; said rubber tire, metallic band and nuts being vulcanized together, and headed and threaded bolts extending through the apertures of the wheel-felly and engaging the exteriorly-threaded nuts.

697,627. JACKETED KETTLE. MAX W. JENNISON, WASHINGTON I. KAWHAR, Louisville, Ky.; said John assigner to said Jennison. Filed Feb. 2, 1901. Serial No. 48,737. (No model.)

Claim.—1. In a jacketed kettle, the combination of an inner bottom shell, a top section permanently joined thereto, extending down below the joint with said bottom and having an outwardly-extending flange, an outer bottom shell having an outwardly-extending flange at its upper edge, means for separably uniting said flanges whereby the joint between said inner bottom shell and top section may be rendered accessible, and the solder G closing said joint at the under side, substantially as set forth.

2. In a jacketed kettle, the combination of an inner bottom shell, a top section permanently joined thereto, extending down below the joint with said bottom, an outer bottom shell, and means for separably uniting the extension of said top section and said outer bottom shell, substantially as set forth.

697,628. INSULATOR AND ATTACHMENT FOR ELECTRIC WIRES. GRANT C. JENNISON, Scranton, Pa. Filed Sept. 11, 1901. Serial No. 73,303. (No model.)

Claim.—1. The herein-described insulator consisting of a body portion adapted to be secured to a peg, and provided with a channel extending horizontally through the top of said portion, and a pair of upwardly-extending legs on opposite sides of said channel outwardly screw-threaded, in combination with a cap arranged to be secured to said body portion, the said cap being provided with a central projection arranged to grasp the wire to be insulated at a central point on the said body portion, and the said cap provided with an overhanging flange arranged to shed water at a point distant from the point of contact of the wire, and arranged at

a higher level than the wire to be insulated, substantially as and for the purpose specified.

2. An insulator of the kind described comprising a body portion with a grooved neck for tying-wire and adapted to be secured to a peg, the said body portion further provided with a channel extending horizontally through the top of said portion, and a pair of oppositely-extending legs on opposite sides of said channel outwardly cover-threaded, in combination with a cap arranged to be secured to said body portion, the said cap being provided with a central projection arranged to grasp the wire to be insulated at a central point on the said body portion, and the said cap provided with an overhanging flange arranged to shed water at a point distant from the point of contact of the wire, and arranged at a higher level than the wire to be insulated, substantially as and for the purpose specified.

697,699. COMBINED GRABING AND CASING THEREFOR.
HENRY B. KIRBY, Lancaster, Pa. Filed June 10, 1901. Serial No. 93,982. (No model.)

Claim.—1. A gear-train-including casing constructed in separable hollow sections of unequal size, secured together so as to form an inclosure having an unobstructed space therein to receive a train of gears, one of said sections being removable to permit access to but without disturbing the included gearing, in combination with a train of spur-wheels included in said casing, bearings for said wheels at opposite sides of the lower or larger section of the casing, a shaft journaled parallel with said gear-train, and a gear-wheel on said shaft in gear with said gear-train.

2. A gear-train-including casing constructed in unequal separable hollow sections, united to form a complete inclosure with unobstructed interior and one of which may be removed to permit access to but without disturbing the gearing included within the casing, in combination with a train of gears having their bearings in opposite sides of the larger section of said casing beyond or below the dividing-line which separates the removable section from said larger including portion, a shaft journaled parallel with said train of gears and a gear-wheel on said shaft in gear with said gear-train.

3. A gear-train-including casing constructed in separable hollow sections of unequal size, one of which may be removed without disturbing the arrangement of the gearing included within the casing, and which together form a narrow oblong housing without interior obstructions and adapted to receive a train of gears journaled therein, in combination with a train of gear-wheels included within said casing and having their bearings in opposite sides of the larger section thereof, a shaft journaled within the casing parallel with said train of gears and a gear-wheel on said shaft in gear with said train.

4. A gear-train-including casing constructed in substantially horizontally-divided separable hollow sections of unequal size, one lying upon the other edge to edge and removable therefrom to permit access to but without disturbing the gearing included within the casing, in combination

with a train of gear-wheels included in the lower larger section, bearings for said train of gears at opposite sides of said lower section, a shaft journaled below said train of gears, and a gear-wheel on said shaft geared to one of the gears of said train.

5. A device or structure of the character herein described, comprising a gear-train, a shaft operated thereby, said train including a beveled gear-wheel, and said shaft having a similar wheel engaged thereby, and an including casing for said parts constructed of two horizontally-divided separable hollow sections secured together edge to edge, one of said sections constituting a cover for the casing, and the other supporting the said gear-train and shaft, said shaft and train of gears having their bearings in and included by said separable sections, substantially as set forth.

6. A device or structure of the character herein described, comprising a gear-train, a shaft operated thereby, and an including casing for said parts constructed of two horizontally-divided separable hollow sections secured together edge to edge, one of said sections constituting a cover for the casing and provided with means for the introduction of a lubricant, and the other section supporting the said gear-train and shaft, said shaft and train of gears having their bearings in and included by said separable sections, substantially as set forth.

7. A device or structure of the character herein described, comprising a gear-train, a shaft operated thereby, said train including a beveled gear, a stub-shaft supported at right angles to said shaft and having a similar right gear, said second-named gear being operated from the train, and an including casing for said parts constructed of horizontally-divided separable sections, said shaft and train of gears having their bearings in and included by said separable sections, substantially as set forth.

8. A gear-train casing comprising an inverted-trough-like section, a similar section of greater depth supporting the former and forming therewith a gear-train inclosure complete, a train of gears housed within said casing, bearings for said gears at opposite sides of the casing, a shaft journaled in bearings in the casing, and a gear-wheel on said shaft engaging one of the gears of said train.

9. A device or structure of the character herein described, comprising a gear-train, a shaft operated thereby, said train including a beveled gear-wheel, and said shaft having a similar wheel engaged thereby, and an including casing for said parts constructed of horizontally-divided separable sections, said casing being provided with an integral plate for attachment of the structure to a support, substantially as herein shown.

10. A device or structure of the character herein described, comprising a gear-train, a shaft operated thereby, and an including casing for said parts comprising separable sections, one of said sections having an interior offset, provided with a headed pin, and the other section having an interior lag provided with a slot in which said pin is received, substantially as shown and described.

11. In combination, a gear-train casing composed of hollow sections of unequal size mounted one upon the other with their hollow sides confronting and having overlapping abutting edges, a train of gear-wheels housed within said casing, bearings for said wheels at opposite sides of the lower larger section of said casing, a shaft journaled adjacent to said train of gears, and a gear on said shaft engaging one of the gears of said train.

12. A device or structure of the character herein described, comprising a gear-train, a shaft operated thereby, a beveled gear on said shaft and an including casing for said parts constructed of horizontally-divided separable sections, one of said sections constituting a cover or lid, and the other supporting the wheels of the gear-train and having an integral tubular portion supporting said shaft, said latter section also having a hollow pendant portion, and a stub-shaft working therein and provided with a beveled gear engaging the similar gear on the shaft, as set forth.

13. A device or structure of the character herein described, comprising a gear-train, a shaft operated thereby, said train including a beveled gear-wheel, and said shaft having a similar wheel engaged thereby, and an including casing for said parts constructed of horizontally-divided separable portions or sections, one of said sections constituting a cover and provided with a self-closing device for admitting a lubricant, the other section supporting the shaft and the wheels of the train and having an integral attaching-plate, and the two sections having interlocking means for detachably securing them together, as set forth.

14. A gear-train-including casing composed of unequal separable sections of substantially trough-like form divided upon an approximately horizontal plane and secured together so as to provide an unobstructed interior, bearings at opposite sides of the casing for a train of gears, a train of gear-wheels journaled in said bearings, a shaft journaled in bearings formed in the larger section of the casing and a gear-wheel on said shaft engaging a gear of said train.

15. A gear-train casing composed of two separable trough-like sections of unequal size mounted one upon the other with their hollow sides confronting, leaving a clear space within to receive a train of gears in

combination with a train of gear-wheels housed within the casing, bearings at opposite sides of the casing for the shafts of said gear-wheels, a shaft extending longitudinally of the casing and a gear-wheel on said shaft engaging one of said train of gears.

697,680. LAMP-HOOK. ROBERT L. KILGORE, Seattle, Wash. Filed Aug. 15, 1901. Serial No. 73,176. (No model.)

Claim.—1. A lamp-hook comprising a body portion having reversely-turned hooks at its ends, said body portion being provided with a neck, a block slidably mounted upon the body portion, and keepers for the hooks pivoted to the block, one of the keepers being constructed and arranged for engagement with the neck to hold the block against movement.

2. A lamp-hook comprising a body portion having terminal hooks, a block slidably upon the body portion, and keepers for the hooks mounted upon the block, one of the keepers being constructed for engagement with the body to hold the block at times against movement.

3. A lamp-hook comprising a body portion having terminal hooks one of which is provided with a jaw, a block slidably upon the body portion and having a jaw for engagement with the jaw of the hook, and keepers for the hooks pivoted to the block, one of the keepers being adapted for engagement with the body to hold the block against movement.

697,681. FARM-GATE. ELIAS KIM, Des Moines, Iowa. Filed June 20, 1901. Serial No. 69,591. (No model.)

Claim.—1. In a gate, a framework hinged to any suitable support, a roller mounted in said framework, and a gate hinged to the framework, substantially as shown and described.

2. In a gate, a framework hinged to any suitable support, a slatted roller mounted in said framework, and a gate hinged to the framework, substantially as shown and described.

3. In a gate, a framework hinged to any suitable support, a slatted roller mounted in said framework, said roller comprising circular end pieces and slats secured to the periphery of said end pieces, and a gate hinged to the framework, substantially as shown and described.

4. In a gate, a framework hinged to one post thereof, a rod connecting the side bars of said framework, circular disks loosely mounted on said rod, slats secured to the periphery of said disks, and a gate hinged to one of the side bars of said framework, substantially as shown and described.

697,682. WOOD-PRESERVING COMPOUND. CARL KLUMME, Seattle, Wash., assignor to Frank Mark Klumme, Seattle, Wash. Filed Oct. 4, 1901. Serial No. 73,123. (No specimens.)

Claim.—1. A wood-preserving compound composed of blue vitriol, sulfate of iron, cyanid of potassium, sulfuric acid, prussic acid, and refined petroleum, compounded in about the proportions set forth.

2. A wood-preserving compound containing sulfate of iron, cyanid of potassium, sulfuric acid, prussic acid and refined petroleum compounded in approximately the proportions set forth.

3. A wood-preserving compound containing blue vitriol, cyanid of potassium, sulfuric acid, prussic acid, and refined petroleum compounded in approximately the proportions named.

697,683.

697,683. AXLE-BEARING. CARL C. KIMM, Northtown, Pa. Filed May 4, 1901. Serial No. 69,712. (No model.)

Claim.—1. A shaft or axle having an adjusting device engaging a sleeve on the shaft and adjustable in a line oblique to the axis.

2. A shaft or axle having a sleeve adjustable along the bearing-surface, and an adjusting device carried by the shaft engaging the sleeve and adjustable across the plane of the axis of the shaft.

3. A shaft or axle having a bore inclined to its axis, adjusting device in the bore, and a movable sleeve on the shaft engaged by said device.

4. A shaft or axle perforated at an oblique angle to its axis and provided with an adjusting-screw in the perforation adapted to shift the bearing-surface of the wheel.

5. A shaft or axle perforated at an acute angle to its axis and provided with an adjusting-screw in the perforation adapted to shift the bearing-surface of the wheel.

6. A shaft or axle perforated at an acute angle to its axis and provided with an adjusting-screw in the perforation, a sliding collar on the shaft and a jam-nut for the screw.

7. A shaft or axle having a beveled end perforated on the beveled place at an acute angle to its axis, an adjusting-screw in the perforation and a sliding collar on the shaft engaged by the screw.

697,684. CAN-OPENER. FRANK KIMM, Northtown, Pa. Filed May 15, 1901. Serial No. 69,755. (No model.)

Claim.—A can-opener, consisting of a handle, a stem having an enlargement near its outer end, a bent portion just beyond said enlargement,

and terminating in a sharp penetrating-point, and a rotating cutting-wheel mounted and longitudinally shiftable on said stem and consisting of a cutting edge and a hub adapted to contact with the end-top to limit the penetration of said cutting edge, said wheel having a convex outer face and a straight inner face.

697,685. APPARATUS FOR MAKING HOLES AND CORES.
HENRY G. LAMBERT, Fitchburg, Ohio, assignor of forty-nine one-eighths to Adelle B. Clark, Steubenville, H. D., and James A. Craft, Hartman, Ohio. Original application filed Aug. 2, 1901, Serial No. 79,572. Divided and this application filed Feb. 26, 1902. Serial No. 81,008. (No model.)

Claim.—1. In apparatus for making molds and cores for pipe-bands, the combination of a swinging carrier, mechanism for raising and lowering said carrier through the arc of a circle, and an adjustable chaper adapted to be shifted toward or from the pivotal axis of said carrier, substantially as described.

2. In apparatus for making molds and cores for pipe-bands, the combination of a swinging carrier, mechanism for raising and lowering said carrier through the arc of a circle, exterior mold and core mechanism adjustable on said carrier, and an adjustable chaper adapted to be shifted toward or from the pivotal axis of said carrier, substantially as described.

3. In apparatus for making molds and cores for pipe-bands, the combination of a swinging carrier, mechanism for raising and lowering said carrier through the arc of a circle, and a vertically-adjustable chaper adapted to be shifted toward and from the pivotal axis of said carrier, substantially as described.

4. In apparatus for making molds and cores for pipe-bands, the combination of a pit, a swinging carrier pivoted at one end of said pit, mechanism for raising and lowering said carrier, and an adjustable chaper adapted to be shifted toward or from the pivotal axis of said carrier, substantially as described.

5. In apparatus for making molds and cores for pipe-bands, the combination of a pit, a swinging carrier composed of I-beams united together and pivoted at one end of said pit, adjustable mechanism for raising and lowering said carrier, and an adjustable chaper adapted to be shifted toward or from the pivotal axis of said carrier, substantially as described.

6. In apparatus for making molds and cores for pipe-bands, the combination of a pit, a swinging carrier composed of I-beams united together and pivoted at one end of said pit, adjustable mechanism for raising and lowering said carrier, a track on the sides of said pit, a car on said track with means for locking it at any point desired, an adjustable chaper-carrier on said car, and a chaper adjustable on said carrier, substantially as described.

7. In apparatus for making molds and cores for pipe-bands, the combination of a pivoted vertically-swinging carrier, mechanism for raising and lowering said carrier, a supporting base-piece on said carrier, and a stationary chaper registering with and above said base-piece, whereby a flask may be placed upon said base-piece surrounding said chaper, and, as the plastic material is rammed in around said chaper said carrier may be lowered and successive sections of flask may be added and secured one above the other, as desired.

8. In apparatus for making molds and cores for pipe-bands, the combination of a pivoted vertically-swinging carrier adjustable on its pivotal bearings, mechanism for raising and lowering said carrier, an adjustable supporting base-piece on said carrier, and an adjustable chaper registering with and above said base-piece, whereby external molds or cores may be built up on said carrier having bands of different radii and with or without straight ends, as desired, substantially as described.

9. The combination of the pit A, the adjustable swinging carrier D pivoted at one end of said pit, a car G capable of traveling across the top of said pit, winch mechanism on said car and connected to the free end

of said swinging carrier, a second carrier H capable of traveling across said pit, a former-carriage on said car, and an adjustable chaper on said former-carriage, substantially as described.

697,686. MACHINE FOR WIRING SHEET-METAL ARTICLES.
JOSEPH LAMBERT, EDWIN THREMLAY, and ANTOINE LALANDE, Montreal, Canada. Filed July 9, 1901. Serial No. 67,974. (No model.)

Claim.—1. In a machine for wiring sheet-metal articles, cooperating male and female dies, the female die having spring-actuated yieldable sections movable upwardly on diverging lines and each provided with means for retaining a wire in position on the active face thereof, as set forth.

2. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die provided with yieldable stems for retaining a wire ring adjacent to a deflecting or bending surface of the die, substantially as described.

3. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die comprising a common die-shell, a series of die members yieldably confined within said shell, and means for retaining a wire ring in operative position relative to the die members, substantially as set forth.

4. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die comprising a series of yieldable sections each having a wire-ring-retaining means, substantially as set forth.

5. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die comprising a series of yieldable sections and provided with yieldable pins adapted to retain a wire ring in proper relation to the female die, substantially as set forth.

6. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die comprising a series of spring-actuated die members disposed in matching relation, and said male die provided with yieldable stems arranged at intervals thereon and adapted to rest upon and to open the spaces between the sections of the female die when the two dies are brought into cooperating relation, substantially as set forth.

7. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die comprising a common die-shell, a series of spring-actuated die members arranged in matching relation within said die-shell, a series of wire-ring retainers, and means for holding the retainers of the die-sections in proper relation, substantially as set forth.

8. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die consisting of a fixed die-shell provided with an internal plate or disk which forms a nest for a sheet-metal article, a series of die-sections within the shell, and ring-retaining means cooperating with said die-sections, substantially as set forth.

9. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die comprising a die-shell having an internal nest in a series of yieldable sections adapted to said nest, said male die provided with a central stem and a spring-actuated clamping-disk arranged to enter the space formed by the series of members of the female die, said disk in the cooperative positions of the two dies adapted to open the spaces between the internal nest and the female die members on the depression of the latter to occupy the nest, substantially as set forth.

10. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die having movable spring-actuated members seated in a die-shell, said male die comprising a suitable head, and a plurality of arcuate members yieldably mounted on the head and each having a grooved working face, and a series of yieldable stems carried by said arcuate members of the male die and arranged to be seated upon the movable members of the female die, substantially as described.

11. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die having downwardly-yielding members, said male die comprising a series of radially-yielding arcuate members each having the external chambered bottom, a series of vertical stems fixed in said bottom and provided with feet to rest upon the female die members, and cushion-springs for said stems, substantially as set forth.

12. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die having downwardly-yieldable members normally held in raised divergent relation, and said male die provided with radially-expandible die members and with spring-embodied vertical stems adapted to be coated upon the female die members and to open the spaces between the same, as set forth.

13. In a machine for wiring sheet-metal articles, cooperating male and female dies, said male die comprising a head, a series of arcuate members yieldably confined on the head, and cushioned stems arranged to be coated upon the female die, substantially as described.

14. In a machine for wiring sheet-metal articles, cooperating male and female dies, said female die having yieldable members, and said male die provided with expandible members disposed in cooperative relation to the female die members, and cushioned stems mounted on the male die members and adapted to remain inactive until the final period of downward thrust of the male die, substantially as described.

15. In a machine for wiring sheet-metal articles, cooperating male and female dies, the female die having yieldable members arranged for movement on divergent lines, and the male die comprising a head, a series of radially-movable yieldable members confined on the head and disposed in cooperative relation to the female die, chambered stems carried by the members of the male die, and spring-biased stems fitted in the bones and arranged to rest upon the cottages of the female die, substantially as set forth.

16. In a machine for wiring sheet-metal articles, a female die provided with a bending or deflecting groove, and a series of yieldable stems coated in said die and normally exposed above the active face thereof in cooperative relation to the groove therein, combined with a male die or plunger, substantially as described.

697,687. SHIELD FOR VACCINATIONS, &c. JOHN R. LEE, Cincinnati, Pa. Filed Nov. 12, 1901. Serial No. 92,919. (No model.)

Claim.—A shield comprising a ring having a horizontally-projecting flange with a strip of surgeon's adhesive plaster fitting over and around the ring and on the flange thereof, in combination with a cap fitting over the ring and a strip of adhesive material surrounding the cap and adhering to the first-mentioned strip to hold the cap in place.

697,688. PROCESS OF DRAWING MOLTEN METAL FROM RECEPTACLES. LUTHER LINCOLN, Boston, Mass., assignor of one-half to Charles S. Gooding, Boston, Mass. Filed June 18, 1901. Serial No. 92,920. (No specimens.)

Claim.—1. The process of drawing molten metal from a receptacle which consists in collecting the molten metal in a suitable receptacle; creating a superatmospheric air-pressure upon the surface of said molten mass, thereby maintaining it at a level below its normal level and forcing a portion of the molten metal into a second receptacle to a level higher than its normal level in said first-named receptacle; then tapping said molten mass in said second receptacle at a point above its normal level in said first-named receptacle, and finally creating a superatmospheric air-pressure upon the surface of the molten metal in said second receptacle.

2. The process of drawing molten metal from a receptacle which consists in collecting the molten metal in a suitable receptacle; creating a superatmospheric air-pressure upon the surface of said molten mass, thereby maintaining it at a level below its normal level and forcing a portion of the molten metal into a second receptacle to a level higher than its normal level in said first-named receptacle; then tapping said molten mass in said second receptacle at a point above its abnormal level in said

first-named receptacle; and finally creating a superatmospheric air-pressure upon the surface of the molten metal in said second receptacle.

3. The process of drawing molten metal from a receptacle which consists in collecting the molten metal in a suitable receptacle; creating a superatmospheric air-pressure upon the surface of said molten mass, thereby maintaining it at a level below its normal level and forcing a portion of the molten metal into a second receptacle to a level higher than its normal level in said first-named receptacle; then tapping said molten mass in said second receptacle at the surface of its abnormal level; and finally creating a superatmospheric air-pressure upon the surface of the molten metal in said second receptacle.

4. The process of drawing molten metal from a receptacle which consists in collecting the molten metal in a suitable receptacle; creating a superatmospheric air-pressure upon the surface of said molten mass, thereby maintaining it at a level below its normal level and forcing a portion of the molten metal into a second receptacle to a level higher than its normal level in said first-named receptacle; creating a partial vacuum in said second receptacle and then tapping said molten mass in said second receptacle at a point above its abnormal level in said first-named receptacle.

5. The process of drawing molten metal from a receptacle which consists in collecting the molten metal in a suitable receptacle; creating a superatmospheric air-pressure upon the surface of said molten mass, thereby maintaining it at a level below its normal level; forcing the molten metal into a second receptacle to a level higher than its normal level in said first-named receptacle; creating a partial vacuum in said second receptacle and then tapping said molten mass in said second receptacle at the surface of its abnormal level.

697,689. ADJUSTABLE TABLE OR DESK. EMER LINCOLN, Brooklyn, N. Y. Filed Mar. 8, 1901. Serial No. 92,921. (No model.)

Claim.—1. An adjustable table or desk, comprising front and back legs pivotally attached together at their upper ends; a support pivotally attached to said front legs and provided with adjusting means attached thereto and to said back leg; and a top, one end of said top being supported by the upper ends of the legs and the other end of the top being supported by said support.

2. An adjustable table or desk, comprising front and back legs pivotally attached together at their upper ends and adapted to fold together when not in use; a brace adapted to hold the lower ends of said legs apart and to fold as to permit them to come together; an adjustable support pivotally attached to said front legs and provided with adjusting means attached thereto and to said back leg; and a top adapted to be borne by said legs and said adjustable support.

3. An adjustable table or desk, comprising front and back legs pivotally attached together at their upper ends and adapted to fold together when not in use; a brace adapted to hold the lower ends of said legs apart and to fold as to permit them to come together; an adjustable support pivotally attached to said front legs and provided with adjusting means attached thereto and to said back leg; and a top provided with inferior bars or strips provided with grooves or notches.

4. In an adjustable table or desk, the combination with legs *a* and *b*, a pawl *m* pivotally attached to the leg *f*, a horizontal bar *h* connecting the front legs *a* and *b* and to which the back leg *f* is pivotally attached, folding braces or bars *g* between the front and back legs, a supporting frame *i* pivotally attached to the legs *a* and *b* and aatchet *k* pivotally attached to said frame *i* adapted to engage with the pawl *m*; of a top *c* having bars or strips *p* on its under surface provided with grooves or notches *q*.

5. In an adjustable table or desk, the combination with legs *a* and *b* pivotally attached together at their upper ends, a pawl *m* pivotally at-

tached to the leg *f*, filling beam or bar *g* between the front and back legs, a supporting-frame *i* pivotally attached to the legs *a* and *c*, and a ratchet *k* pivotally attached to said frame *i* and adapted to engage with said pawl *m*, of a top *e* having bars or strips *p* on its under surface provided with grooves or notches *q*.

6. In an adjustable table or desk, the combination with legs *a* and *c*, a pawl *m* pivotally attached to the leg *f*, a horizontal bar *g* connecting the front legs *a* and *c* and to which the back leg *f* is pivotally attached, a supporting-frame *i* pivotally attached to the legs *a* and *c*, and a ratchet *k* pivotally attached to said frame *i* and adapted to engage with said pawl *m*, of a top *e* having bars or strips *p* on its under surface provided with grooves or notches *q*.

7. In an adjustable table or desk, the combination with legs *a* and *c* pivotally attached together at their upper ends, a pawl *m* pivotally attached to the leg *f*, a supporting-frame *i* pivotally attached to the legs *a* and *c*, and a ratchet *k* pivotally attached to said frame *i* and adapted to engage with said pawl *m*, of a top *e* having bars or strips *p* on its under surface provided with grooves or notches *q*.

697,640. RAILWAY-TIE. HENRY E. J. HANSEN, Des Moines, Iowa. Filed July 24, 1901. Serial No. 68,082. (No model.)

Claim.—1. An improved metallic railway-tie comprising a body portion substantially A shape in cross-section and having portions cut away near each end to thereby form two parallel edges on the sides of the body and two vertical shoulders at the ends of the parallel edges, and a rail-support for each end of the tie, each of said supports having its end portion shaped to rest upon the parallel edges and against the under faces thereof to prevent movement transversely of the tie and also shaped to engage the vertical shoulder to prevent movement longitudinally of the tie, and means for securing rails to the rail-supports.

2. An improved metallic railway-tie comprising a rolled metal body portion of such shape that in cross-section its central portion is curved upwardly, said body portion having its top portion cut away near each end to thereby form two parallel edges on the sides of the body portion and two shoulders at the ends of the parallel edges, and a rail-support for each end of the rail, each of said supports being of a size and shape to rest upon said parallel edges and against both of said vertical shoulders, and means for securing a rail to the top of each support.

3. An improved metallic railway-tie comprising a body portion substantially A-shaped in cross-section and having portions cut away near each end to thereby form two parallel, longitudinal edges and two vertical transverse shoulders, a rail-support for each end, said support having its under surface designed to rest on the straight edges, and having a downwardly-projecting projection to enter between said straight edges, an integral base portion on the rail-support to overlap the sides of the body portion, a shoulder on the rail-support to engage the said vertical, transverse shoulders, said supports having a platform to receive the two metallic surfaces and having an integral rail-securing member to engage the outer portion of a rail, and also having a detachable rail-securing device to en-

gage the under portion of the rail, substantially as and for the purposes stated.

697,641. FIRE-EXTINGUISHING COMPOSITION. JAMES E. HILLMAN, Richmond, Ind. Filed Sept. 2, 1901. Serial No. 74,282. (No specimen.)

Claim.—1. The herein-described composition of matter, consisting of bicarbonate of soda, soda-ash, sulfur, manganese, lime, caustic soda, salt, meal-powder, saltpeter and sea-sand, substantially as described and for the purpose specified.

2. The herein-described composition of matter for extinguishing fire, consisting of bicarbonate of soda twenty-five pounds, soda-ash five pounds, sulfur three pounds, manganese ten ounces, lime three pounds, caustic soda eight ounces, salt one pound, meal-powder eight ounces, saltpeter four ounces and sea-sand four pounds, substantially as described.

697,642. PROCESS OF STRENGTHENING CLAY HYDRAULIC PIPE, VASES, CROCKERY-WARE, &c. LORENZO MILLER, Hingham, Maine. Filed Mar. 9, 1901. Serial No. 69,512. (No model.)

Claim.—The method of strengthening pipe and other pottery articles by first burning the same to the proper consistency, then grooving the same around the outside, then wrapping wire or iron rods tightly in the grooves, then applying the glazing to form a hard and smooth surface.

697,643. PORTABLE MOTO-TRUCK. GEORGE E. RUSSELL, Chicago, Ill., and WILLIAM LIND, New York, N. Y. Filed Nov. 2, 1901. Serial No. 61,892. (No model.)

Claim.—In a portable moto-truck, the combination with upper and lower rings 1 and 2, the lower ring being of less diameter than the upper ring, of converging separated track-chains 4 connecting said rings and angular supports having their vertical and horizontal portions connected respectively with the upper and lower rings, substantially as specified.

697,644. BASH-FUL. MATTHEW E. BROWN, Indianapolis, Ind., assignor to Atlas Engine Works, Indianapolis, Ind., a Corporation of Indiana. Filed July 2, 1901. Serial No. 67,611. (No model.)

Claim.—1. In a dash-pot adapted for the use of an elastic fluid, a piston B and cylinder C with a passage connecting points near the top and bottom of each cylinder, arranged to cause the fluid above the piston to be compressed with uniformly-increasing force as the piston is raised, and provision D for varying the area of the connecting-passage and thereby allowing the variably-retarded transfer of such air during the whole of the upper portion of the movement under all conditions, substantially as herein specified.

2. In a dash-pot the cylinder bored as shown, and a corresponding piston B and large piston-rod B' with provision for working the same air alternately above and below the larger part of each piston, and provision D for varying the area of the connecting-passage and thereby allowing the variably-retarded transfer of such air during the whole of the upper portion of the movement under all conditions, substantially as herein specified.

3. In a dash-pot a piston and cylinder with provision for working the same air alternately above and below the piston and provision for

variably checking the transfer of the air downward and a separate passage and self-closing valve therein for allowing it to be more easily transferred upward, all substantially as herein specified.

4. In a dash-pot having a cylinder, a piston and a large piston-rod providing an annular space above and a larger cylindrical space below, the passage *O* *F* connecting the upper space with a point above the bottom of the lower space so that the piston will not only be urged downward by the pressure above and the vacuum below with varying force as required, but also that the air will be positively imprisoned under the piston near the end of the movement and more rapidly cushion it, all substantially as herein specified.

5. In a dash-pot having a cylinder, a piston and a large piston-rod providing an annular space above and a larger cylindrical space below, the passage *O* *F* connecting such spaces, and a valve *D* for adjusting the size of such passage, in combination with a separate passage *H*, and a check-valve *G* therein, arranged to deliver air or oil or both upward but forbid its descent, all substantially as herein specified.

6. In a dash-pot having a cylinder, a piston and large piston-rod providing an annular space above and a larger cylindrical space below, the passage *O* *F* connecting the upper space with a point as much above the bottom of the lower space that the piston will not only be urged downward by vacuum with varying force as required, but also that the air will be imprisoned and more rapidly cushion the motion at the end of the movement, in combination with the check-valve *G* and passage *H* arranged to deliver air or oil or both upward but forbid its descent, all substantially as herein specified.

697,645. OIL-WATER SEPARATOR. CHARLES L. MORRIS, Patbury, Me. Filed Oct. 2, 1901. Serial No. 77,310. (No model.)

Claim.—1. In a cream-separator, a double-walled receptacle comprising an outer shell and an inner shell connected by top and bottom walls and forming an outer annular water-space, in combination with a cluster of inner water-tubes removably mounted in the receptacle, a disk or plate to which the upper ends of the water-tubes are connected for their support, said disk or plate having a ventilated flange which rests on the top of the receptacle, and means providing for a circulation of water between the inner tubes and outer water-space, substantially as described.

2. In a cream-separator, a double-walled receptacle embodying an outer annular water-space, in combination with a cluster of water-tubes centrally and removably mounted in the receptacle, an upper receptacle to which said tubes are connected at their upper ends, and a conical bottom or receptacle with which the lower ends of said tubes communicate, said conical bottom or receptacle having a valve communicating with the milk-space, substantially as described.

3. In a cream-separator, a double-walled receptacle embodying an outer annular water-space, in combination with a centrally-arranged cluster of inner water-tubes, a conical bottom connecting the lower ends of said tubes, a control valve-tube arranged between the water-tubes and extending through the conical bottom, a valve controlling an opening leading from the interior of said tube to the conical bottom, and means at the top of the apparatus whereby the valve may be manipulated.

4. In a cream-separator, a vessel or receptacle comprising concentric outer and inner walls forming an outer annular water-space, a bottom coating to which said walls are connected at the bottom, and draw-off pipes connected with said coating and communicating with the milk-space

and outer water-space, in combination with a cluster of inner water-tubes removably mounted in the milk-space, an upper receptacle with which said tubes communicate, and an overflow-tube leading from said upper receptacle to the outer water-space.

5. In a cream-separator, a double-walled receptacle embodying an outer water-space, and a top therefor comprising an inwardly-extending annular flange which overhangs the milk-space, in combination with a cluster of inner water-tubes removably mounted in the milk-space and having their upper and lower ends placed in communication with each other and out of communication with the milk-space, means for filling and emptying said water-tubes, and means whereby the inner tubes are placed in communication with the outer water-space.

6. In a cream-separator, a double-walled receptacle embodying an outer water-space, in combination with a cluster of inner water-tubes removably mounted therein, an upper receptacle to which said tubes are connected and with which they communicate, an overflow-tube connected with said upper receptacle and adapted to discharge into the outer water-space, and fastening means for holding the water-tubes in place, substantially as described.

697,646. MOTOR-VEHICLE. CHARLES E. MORRIS, New York, N. Y. Filed Aug. 11, 1901. Serial No. 56,577. (No model.)

Claim.—1. In a motor-vehicle, the combination with the vehicle-body, of a wheel and a crank connection therefrom, a substantially straight bar-spring extending longitudinally of the vehicle and attached at its inner end to said vehicle-body and at its outer end to said crank connection, whereby the vehicle-body is yieldingly supported, and a longitudinal thrust-bar pivoted at its inner end to the vehicle-body and its outer end to said connection.

2. In a motor-vehicle, the combination with the vehicle-body, and the cross-frame to the ends of which the steering-wheel axle is pivoted, of a pair of substantially straight bar-springs attached at their inner ends to the vehicle-body and at their outer ends to the said cross-frame at or near the ends of the latter, said springs being arranged lon-

gitudinally of the springs in a substantially horizontal manner, and converging inwardly or outwardly their point of attachment to the vehicle-body to permit a substantial amount of turning movement to the steering-wheel.

3. In a motor-vehicle, the combination with the vehicle-body, and the cross-frame to the ends of which the front-wheel axle is pivoted, of a pair of substantially straight bar-springs attached at their inner ends to the vehicle-body and at their outer ends to the said cross-frame at or near the ends of the latter, said springs being arranged longitudinally of the springs in a substantially horizontal manner, and converging rearwardly to permit a substantial amount of turning movement to the front wheel, and to resist twisting thrust of said wheel, as set forth.

4. In a motor-vehicle, the combination with the vehicle-body, of a driving-wheel and its axle, a motor-shaft journaled within the vehicle-body, a driving connection between said motor-shaft and driving-wheel, a roller-bar interposed between said motor-shaft and axle, and a substantially straight bar-spring having an inner point of attachment to the vehicle-body and an outer point of attachment to the axle, said outer point being horizontally and longitudinally remote from said inner point.

5. In a motor-vehicle, the combination with the vehicle-body, of a driving-wheel and its axle, a motor-shaft journaled on the vehicle-body in an elevated position with respect to said axle, a driving connection between said motor-shaft and wheel, and a yielding supporting and thrust connection between the vehicle-body and wheel-axle extending longitudinally of the vehicle and comprising a bar-spring and a pivotal arm connected to the vehicle-body, respectively below and above the motor-shaft, and connected to the wheel-axle below and above the latter.

6. In a motor-vehicle, the combination with the vehicle-body, of a driving-wheel and its axle, a motor-shaft journaled on the vehicle-body in an elevated position with respect to said axle, a driving connection between said motor-shaft and driving-wheel, a roller-bar interposed between said motor-shaft and axle, a longitudinally-extending arm connected pivotally to the axle on the upper side thereof, and to the vehicle-body above the motor-shaft, and a longitudinally-extending bar-spring pivotally connected to the axle on the under side thereof and attached to the vehicle-body below the motor-shaft.

7. In a motor-vehicle, the combination with the vehicle-body, of the driving-wheel and its connecting-axle, a motor-shaft journaled on the vehicle-body in an elevated position with respect to said axle, a driving connection between said motor-shaft and wheel, a roller-bar interposed between said motor-shaft and axle, a pair of longitudinally-extending bar-springs attached at their inner ends to the vehicle-body below the motor-shaft, and pivotally connected to the axle on the under side thereof, and a pair of longitudinally-extending arms connected pivotally at their inner ends to the vehicle-body above the motor, and at their outer ends to the axle on the upper side thereof.

697,647. PIPETTE. EDWARD HANSMANN, Barmen-on-the-Rhine, Germany. Filed Mar. 17, 1902. Serial No. 55,700. (No model.)

Claim.—1. A pipette, comprising a flexible container, having a tube terminating in a rigid nozzle with an aperture through same; a casing also provided with an aperture fitting over said nozzle; and a spring, whereby said apertures in nozzle and casing respectively, are held out of coincidence when the appliance is not being used; substantially as described.

2. A pipette, comprising a flexible container *a*, tube *b* and nozzle *c*, having an aperture *d*; a casing *e* provided with aperture *f*, and a spring *g*, whereby said apertures *d* and *f* are held out of coincidence when the appliance is not in use, substantially as described.

697,648. MECHANISM FOR REMOVING TRILLY-WIRE. WILLIAM A. McALLISTER, Cincinnati, Ohio. Filed July 20, 1901. Serial No. 70,105. (No model.)

Claim.—1. A die for the compression of trilly-wire, having a longitudinal perforation for the reception of the wire, and provided with lateral channels for the reception and play of compression-chucks, said die having an enlargement at one side only of its perforation to receive and control the displaced metal, as set forth.

2. In trilly-wire-compressing apparatus, a die provided with a longitudinal perforation and lateral channels substantially as set forth, said die being divided in two parts in an axial plane of the longitudinal perforation and one of said parts having its portion of the said perforation enlarged to receive and control the displaced metal.

3. The combination of a die having a longitudinal perforation for the reception of the trilly-wire, said perforation being enlarged at one side to receive and control the displaced metal, and lateral channels opening into the same, in combination with compression-chucks adapted to be contained and guided in the lateral channels, as set forth.

4. A die for holding and removing trilly-wire, consisting of a block of metal longitudinally perforated to fit the wire, with a central enlargement on one side of the perforation to receive and control the displacement of metal caused by compression of sections at opposite sides, substantially as set forth.

5. A die consisting of two flat blocks of metal to fit one upon the other, each having a corresponding semicircular groove, the two grooves forming a longitudinal aperture for reception of a trilly-wire, one of said grooves being enlarged, correspondingly with the recesses to be formed in the wire, to receive the metal displaced by compression, in combination with two chucks entering the aperture at opposite sides, substantially as set forth.

6. In a trilly-wire-removing device, a die adapted to embrace the wire, compression-chucks entering the die at opposite sides and bearing against the wire, and means including bell-crank levers engaging the chucks horizontally, for applying mechanical pressure equally to the outer ends of the compression-chucks to force them into the wire a predetermined distance, substantially as set forth.

7. In a trilly-wire-removing device, the combination of a hydraulic single-acting cylinder, a piston adapted to act as a platen, a block-die perforated for the reception of the wire and adapted to rest upon and be carried upward by the platen, compression-chucks entering the block-die laterally toward the perforation, and pivotally-supported bell-crank levers arranged at the sides of the die each with one arm bearing vertically upon the die and the other bearing horizontally against the chucks, substantially as set forth.

697,649. ROTARY EXPLOSIVE-ENGINE. JAMES A. McALLISTER, Boston, Mass. Filed June 7, 1902. Serial No. 15,242. (No model.)

Claim.—1. In an internal-combustion engine, a combustion-cylinder and a piston adapted to reciprocate therein; a screw-and-nut motion-transmitting device; means connecting the piston with the reciprocating member of the motion-transmitting device to its initial position at the end of the stroke; a driving-shaft and a one-way clutch connecting the rotating member of the motion-transmitting device with the driving-shaft.

2. In an internal-combustion engine, a combustion-cylinder and a piston adapted to reciprocate therein; a screw-and-nut motion-transmit-

ing device; means connecting the piston with the reciprocating member of the motion-transmitting device; an auxiliary motor to return the reciprocating member of the motion-transmitting device to its initial position at the end of the stroke; a driving-shaft and a fly-wheel governing the same and a one-way clutch connection between the rotating member of the motion-transmitting device and the driving-shaft.

3. In an internal-combustion engine, a combustion-cylinder and a piston adapted to reciprocate therein; a screw-and-nut motion-transmitting device; means connecting the piston with the reciprocating member of the motion-transmitting device; a driving-shaft and a one-way clutch connecting the rotating member of the motion-transmitting device with the driving-shaft; an auxiliary motor, 20, 21, connected with the combustion-piston; a compressed-air-storage tank for the auxiliary motor; inlet 22 between that tank and the motor, all organized and arranged to cause the combustion-piston to be returned to its initial position by the operation of the auxiliary motor.

697,650. FREIGHT-CAR. FRIEDRICH HASEL, Essen, Germany. Assignor to Fried. Krupp, Essen, Germany. Filed Jan. 2, 1901. Serial No. 41,861. (No model.)

Claim.—1. A railway-car having a suitable frame and a removable flooring replaceable in whole or in part, made up of structural iron beams each of which is movable into and out of place independently of the others, and each fixed in place upon the frame of the car by its own independent and readily-removable securing means.

2. A flooring for freight-cars, comprising a series of iron flooring-

beams, each movable into and out of place independently of and without disturbing the others, and secured to the frame of the car by its own independent and readily-detachable securing means.

3. A flooring for freight-cars, comprising a series of separate and detachable flooring-beams, each secured in place upon the frame of the car by its own independent and readily-detachable means and each movable into and out of place independently of and without moving the remaining beams.

4. In a freight-car, the combination of the framing members B, C, D, forming a fixed framing-structure, and the floor members A formed of structural iron placed upon the framing members, each separately and detachable from the rest and independently movable into and out of place without moving the rest, and securing-bolts E for each separate flooring member detachably securing said members in place.

697,651. COMBINATION-LOCK. WILLIAM J. HINES, New Britain, Conn. Filed Aug. 26, 1901. Serial No. 73,504. (No model.)

Claim.—1. In a lock of the class specified a plurality of dial, tumblers operated by the dial, notches in the periphery of the tumblers, the lock-bolt and an unbalanced lever connected with said bolt, the ends of said lever cooperating with the notches in the tumblers to retract the bolt by further movement of some of the tumblers, substantially as described.

2. In combination in a device of the class specified, dial, tumblers operated thereby, recesses in said dial, the lock-bolt and an unbalanced lever connected with said bolt, the ends of said lever cooperating with said recesses to operate the bolt by further movement of part of the tumblers, substantially as described.

3. In combination in a device of the class specified, the dial and their operating-handles held against lengthwise movement, tumblers secured to each dial, a tumbler mounted independent of the dial, a stationary lug on one of the first-mentioned tumblers adapted to engage a projection from the last-mentioned tumbler, recesses in the periphery of each of the tumblers, the lock-bolt and mechanism connected therewith and operated by further movement of part of said tumblers for retracting said bolt, substantially as described.

4. In a device of the class specified the dial, tumblers secured to each dial and a tumbler mounted independent of said dial, notches in the periphery of said tumblers, the lock-bolt, an unbalanced lever connected with said lock-bolt, one end of said lever cooperating with the notches in the other dial-tumbler and in the independent tumbler, substantially as described and for the purposes set forth.

5. In a device of the class specified two or more dial, a notched tumbler operated by each of said dial, an independent tumbler mounted adjacent to one of said dial-tumblers, a notch in the periphery of said independent tumbler, the lock-bolt and the lever carried thereby, one end of said lever cooperating within a notch in one of the dial-tumblers, the opposite end of said lever being bent to cooperate with the notches in the other dial-tumbler and the adjacent independent tumbler, as and for the purposes specified.

6. In a device of the class specified, the dial mounted in the front of the door, tumblers on the inside of said door connected with said dial, recesses formed in the periphery of said tumblers, a tumbler mounted on a removable support independent of the dial-tumbler, and recesses in the periphery of said independent tumbler, a lug on one of said dial-tumblers engaging a projection on the independent tumbler, the locking-bolt and a lever pivoted to said bolt, said lever having at one end a tooth adapted to enter the recess in one of the dial-tumblers, and at the other end a pawl adapted to enter the recess in the other dial-tumbler and the independent tumbler, as and for the purposes specified.

7. In a device of the class specified the dial marked into divisions in the ordinary manner, an arm positively secured to one of said dial and carrying at its ends a pin, a tumbler having a series of holes corresponding to the divisions of the dial, said tumbler connected with said dial by said pin, a second tumbler mounted independently of the other dial and having a series of holes corresponding to the divisions on the dial, and connections between the second dial, and the independent tumbler.

8. In a device of the class specified the disk having the ordinary divisions marked thereon, an arm positively connected with one of said disks and having a pin at its outer end, a tumbler having a series of holes corresponding to the divisions on the disk connected therewith by said pin, and an arm mounted independently of the second disk and having at its end a pin, a second tumbler having a series of holes corresponding to the divisions on the second disk, said pin projecting through one of the holes in said tumbler, and a finger operated by said second disk and adapted to engage said pin to operate the second tumbler, substantially as described.

9. In a device of the class specified the disk suitably divided, arms operated by said disk, pins located in the ends of said arms, tumblers having series of holes corresponding to the divisions of the disk, and pins in the ends of said arms being adapted to enter different holes in the disk to change the combination, said tumblers being held in position by a spring, substantially as described.

10. In a device of the class specified the disk mounted side by side, tumblers connected with and operated by said disk, a tumbler mounted independent thereof, recesses in the periphery of said tumblers, a lock-bolt and an unbalanced lever pivoted thereto and means located at each end of said lever cooperating with said tumblers, as and for the purposes specified.

11. In combination in a device of the class specified the disk the tumblers H' secured to and operated thereby, the notches J' of the independent tumbler H, notch m on the periphery thereof, bolt T, unbalanced lever P pivoted thereon, teeth Q on one end of said lever and the pawl p at the opposite end thereof, all arranged and adapted to operate substantially as described.

697,653. GAME. GERRARD BROWN, Sr., and GERRARD BROWN, Jr., Chicago, Ill. Filed Oct. 23, 1901. Serial No. 59,309. (No model.)

Claim.—1. In apparatus of the character described, the combination of a target, a ball-impelling device, and an open-topped interposed ball-carrier serving to support and expose a ball, said ball-carrier having motion relatively to the other two parts and said ball-impelling device being arranged perpendicularly to the path of the ball.

2. In apparatus of the character described, the combination of a target having a circular outer edge, and a rotary ball-carrier adjacent to said outer edge.

3. In apparatus of the character described, the combination of a target divided into radially-arranged chambers and having a circular outer edge, and a rotary ball-carrier adapted to support balls adjacent to the outer edge of said target.

4. In apparatus of the character described, the combination of an annular target, an annular ball-carrier, and means for supporting and rotating said carrier, substantially as described.

5. In apparatus of the character described, the combination of a platform having a circular slot, a rotary ball-carrier projecting through said slot, and actuating means for said carrier.

6. In apparatus of the character described, the combination of a platform having a circular slot, an annular ball-carrier projecting through said slot, and an impelling device located outside said slot, substantially as described.

7. In apparatus of the character described, the combination of an annular platform having an inner annular flange and divided into radially-arranged chambers, and a rotary ball-carrier encircling said platform, substantially as described.

8. In apparatus of the character described, the combination of an annular platform having an inner annular flange and divided into radially-arranged chambers, a rotary ball-carrier encircling said platform, and a series of suitably-supported, plunger-equipped impelling devices arranged outside said carrier, substantially as described.

697,658. PNEUMATIC STACKER. FREDERICK L. BROWN, Racine, Wis. Filed Jan. 6, 1901. Serial No. 59,302. (No model.)

Claim.—1. In pneumatic stacker, the combination with the blast-

fan and its stationary casing, of the bustle-pipe extended therefrom, the oscillatory turn-table at the outer end of said pipe and the continuous main chute devoid of cross-joint, contained freely from the turn-table but slidably fitting the bustle-pipe so as to shift universally thereon, substantially as described.

2. In pneumatic stacker, the combination with the blast-fan and its stationary casing, of the bustle-pipe extended therefrom, the oscillatory turn-table at the outer end of said pipe and the continuous main chute devoid of cross-joint, curved downward at the rear and by opposite pin-plate connections contained freely from the turn-table but slidably fitting the bustle-pipe so as to shift universally thereon, substantially as described.

697,654. TRAIN SIGNAL. AMERAS BOVAY, Trenton, N. J., assignor of one-half to Sigmond Seiler, Trenton, N. J. Filed Nov. 20, 1901. Serial No. 59,126. (No model.)

Claim.—1. A train-signal composed of a series of metallically-connected metal frames arranged along the rails, transmitting and receiving contacts mounted upon said frames, means for connecting the transmitting-contacts with a source of electricity, means for closing the transmitting and receiving contacts by each of two moving engines, slugs on the engines adapted to be brought into metallic connection with the receiving-contacts, and a return-wire, substantially as specified.

2. A train-signal composed of a series of levers g, projecting above the rails, a series of contacts c, a transmitting-contact d, having an insulated section, and a receiving-contact e, the levers g, being adapted to engage the contacts d, e, and the contact d, being adapted to engage the contact c, substantially as specified.

3. A train-signal composed of rails arranged in blocks, a series of chambers, frames within the chambers, contacts c, d, and e, pivoted to the frames, levers g, for engaging the contacts d, e, cables connecting the contacts c, cables connecting the frames h, and a return-wire i, substantially as specified.

4. A train-signal composed of rails arranged in blocks, a series of chambers, frames within the chambers, contacts c, d, and e, pivoted to the frames, levers g, for engaging the contacts d, e, cables connecting the contacts c, cables connecting the frames h, and a return-wire i, combined with an engine having a trolley-wheel, and an arm which is in metallic contact with said wheel and with the engine-frame, substantially as specified.

697,655. GARRAGE-CAR. EMMA O'LEARY, Syracuse, N. Y. Filed Aug. 2, 1901. Serial No. 78,708. (No model.)

Claim.—1. The combination with a garage-structure, of a removable cover having a receiving-shell composed of open-sided sections their

open sides facing each other, and each serving as a closure, for the opening in the other, one section being movable upon the other for the purpose described.

2. A removable cover for garbage-receptacles comprising an outer case, and an inner shell composed of open-sided sections, one being movable relatively to the other in opposite directions from its closed position and each forming a closure for the open side of the other for the purpose set forth.

3. A removable cover for garbage-receptacles comprising an outer case, and an inner shell composed of open-sided sections having their open sides facing each other, one section forming a closure for the opening in the other section and being movable in opposite directions from its closed position for receiving and discharging the garbage.

4. A removable cover for garbage-receptacles comprising an outer case having an inlet-opening for the garbage, and an inner shell composed of open-sided sections having their open sides facing each other one being movable and forming a closure for the opening in the outer case and the other section, said movable section being arranged to close the opening in the outer case and to simultaneously open the other section into the garbage-receptacle and also to close communication with the garbage-receptacle when the open side of said other section is closed with the opening in the outer case.

5. The combination with a garbage-receptacle, of a removable cover having a tapering flange and shoulder interlocking with the open end of the receptacle, said cover consisting of outer and inner shells, the outer shell having a movable lid provided with an inlet-opening, and the inner shell being composed of open-sided sections, one forming a closure for the opening in the other and for the opening in the outer case, the closure-section being movable in the opposite direction from its closed position for receiving the garbage through the opening in the outer case and for discharging the same into the receptacle.

697,656. BEVERAGE AND PROCESS OF MAKING SAME. MARCEL PERREA, Brest, France. Filed June 14, 1901. Serial No. 64,512. (No specimen.)

Claim.—1. The process whereby the said beverage is prepared, to wit, by crushing pineapples into a mash, filtering the juice therefrom, fermenting a part of this juice alone, obtaining brandy from such fermented juice by distillation, by adding to one hundred pounds of the other portion of such pineapple-juice one-half of a pound of brewer's yeast, and one-half of a pound of white sugar, fermenting this compound, until alcohol is developed, again straining this fermented liquor, adding to each one hundred pounds of such fermented liquor, six pounds of the said pineapple-brandy, and bottling the compound as prepared, under pressure, substantially as described, and for the purpose specified.

2. The herein-described composition of matter consisting of pineapple-juice, one hundred pounds, brewer's yeast one-half of a pound, and white sugar one-half of a pound mixed and fermented, and six pounds of pineapple-brandy, added to said fermented liquor, all substantially in the proportions, and prepared by the process heretofore set forth, thereby producing a beverage which is pleasantly flavored with the taste and odor of pineapple, and is an exceedingly agreeable, sparkling, refreshing drink, all substantially as described, and for the purpose set forth.

697,657. FURNACE BRIDGE-WALL. EDWARD A. FORTMEYER, Evanston, Ill. Filed Oct. 31, 1901. Serial No. 52,702. (No model.)

Claim.—1. A masonry furnace-wall provided with an overhanging part which consists of tiles having looking-surfaces at their inner ends and anchor-blocks having interlocking connection with the wall and having looking-surfaces which engage the said looking-surfaces of the tiles.

2. A furnace bridge-wall provided with an overhanging part which consists of tiles which project horizontally forwardly from the bridge-wall, and anchor-blocks having interlocking connection with said bridge-wall and also with said tiles.

3. A wall having an overhanging part which consists of a plurality

of tiles having looking projections on their inner ends and metal anchor-blocks provided with integral, horizontal base-plates which are embedded in the wall, said anchor-blocks having interlocking engagement with the projections on the said tiles.

4. A wall comprising a tile which overhangs the face of the wall, and is provided at its inner end with a projection which is wider at its lower than at its upper part, and a metal anchor-block having an integral, horizontal bottom plate which is embedded in the wall, said anchor-block being wider at its upper than at its lower part and adapted to engage the lateral surfaces of the projections on two adjacent tiles.

5. A furnace bridge-wall provided with an overhanging part which consists of tiles which project horizontally forwardly from the bridge-wall, and metal anchor-blocks having interlocking connection with said wall and also with said tiles, said wall being provided with a longitudinal air-space affording access of air to said metal anchor-blocks.

697,658. FIRE-ARCH. EDWARD A. FORTMEYER, Evanston, Ill. Filed Dec. 21, 1901. Serial No. 52,702. (No model.)

Claim.—1. A fire-arch comprising a plurality of longitudinally-arranged tiles, transverse supporting-girders one of which directly supports one end of each tile and hanger supported by the other girder and which severally support the opposite ends of said tiles.

2. A fire-arch comprising a plurality of longitudinally-arranged tiles, transverse supporting-girders one of which directly supports one end of each tile, hangers supported by the other girder and which severally support the opposite ends of said tiles, and means for holding engaged the hangers and girder with the tiles.

3. A fire-arch comprising a plurality of longitudinally-arranged tiles, transverse supporting-girders one of which directly supports one end of each tile, hangers supported by the other girder which severally support the opposite ends of said tiles and tie-rods extending between and connecting said tile-engaging girder and hangers.

4. A fire-arch comprising longitudinally-arranged tiles provided at both ends with notches, two transverse supporting-girders, one of which is provided with a flange engaging the notches at one end of the tiles, and hangers connected with the other girder and having horizontal lower arms which engage the notches at the other ends of the several tiles.

5. A fire-arch comprising longitudinally-arranged tiles, provided at both ends with notches, two girders provided with bottom flanges which extend in the same direction from the webs thereof, the flange of one of said girders engaging the notches in the ends of the tiles adjacent thereto, and hangers both ends of which have horizontal arms extending in the same direction, and the upper and lower arms of which are engaged with the flange of the other girder and also with the recesses at the other ends of the tiles, and means for holding engaged the hangers and girder with the tiles.

6. A fire-arch comprising longitudinally-arranged tiles, front and rear transverse girders, of which the rear girder engages the rear parts of the tiles, and hangers supported by the front girder and engaging the front parts of the tiles, and a fire-wall supported on the rear girder between the same and the furnace.

7. A fire-arch comprising longitudinally-arranged tiles, front and rear transverse girders, one of which directly supports one end of each tile, hangers supported by the other girder, and severally supporting the opposite ends of said tiles, each of said tiles being provided at its rear end with a projection extending rearwardly past the rear girder and a fire-wall occupying the space above said projections of the tiles and in rear of the rear girder.

8. A fire-arch comprising longitudinally-arranged tiles, each of which

is provided in its forward and rear ends with inwardly-extending notches, and has at its rear end a lower, rearwardly-extending portion, front and rear transverse girders provided with bottom flanges, the flange of the rear girder being engaged with the notches in the rear ends of the tiles, hangers engaging the flange of the forward girder and engaged at their lower ends with the notches in the forward ends of the tiles, and a fire-wall supported on the rear girder and extending downwardly to the lower rearwardly-projecting parts of the tiles.

9. A fire-arch comprising longitudinally-arranged tiles, each of which is provided at its forward and rear ends with inwardly-extending notches, front and rear transverse girders provided with bottom flanges, the flange of the rear girder being engaged with the notches in the rear ends of the tiles, hangers engaging the flange of the forward girder and engaged at their lower ends with notches in the forward ends of the tiles, said rear girder being provided with an upwardly-facing ledge and fire-brick supported on said ledge and engaged with the rear ends of the arch tiles.

10. A fire-arch comprising a plurality of longitudinally-arranged tiles which are each transversely divided into a plurality of sections, transverse supporting-girders one of which directly supports one end of each tile, hangers supported by the other girder which severally support the opposite ends of said tiles, and means for holding engaged the hangers and girder with the tiles.

11. A fire-arch comprising a plurality of longitudinally-arranged tiles which are each transversely divided into a plurality of sections, transverse supporting-girders one of which directly supports one end of each tile, hangers supported by the other girder which severally support the opposite ends of said tiles, two or more of said sections of each tile being made duplicate and interchangeable, and means for holding engaged the hangers and girder with the tiles.

12. A fire-arch comprising a plurality of longitudinally-arranged tiles which are each transversely divided into a plurality of sections, transverse supporting-girders, one of which directly supports one end of each tile, hangers supported by the other girder which severally support the opposite ends of said tiles, the abutting ends of said sections being provided with registering notches which form, when the sections are assembled, key-openings, keys in said openings, and means for holding engaged the hangers and girder with the tiles.

697,659. AUTOMATIC AIR-MOUNTING APPARATUS. WILLIAM W. PRATT, Chicago, Ill. Filed June 26, 1899. Renewed Sept. 13, 1901. Serial No. 73,945. (No model.)

Claim.—1. In apparatus of the character described, the combination with a radiator, or the like, an evaporator, and a fluid-passage connecting said evaporator and radiator, of means for automatically regulating the flow of fluid through said passage, comprising a valve, and a float within said evaporator connected with and operating said valve, substantially as and for the purpose set forth.

2. In apparatus of the character described, the combination with a radiator, or the like, and an evaporator, of a pipe within said evaporator and in communication with said radiator and serving to conduct fluid from the radiator, a valve controlling the discharge from said pipe, and a float within said evaporator for moving said valve, substantially as and for the purpose set forth.

3. In apparatus of the character described, the combination with a radiator, or the like, of an evaporator, a pipe within said evaporator above the water-level and in communication with said radiator and serving to conduct fluid from the radiator, a valve controlling the discharge from said pipe, and a float for moving said valve to close it when the water reaches a predetermined level, substantially as and for the purpose set forth.

4. The combination with a radiator, or the like, an evaporator vessel resting on the top thereof and mounted thereon, of a pipe within said evaporator and projecting past an end of the radiator, an automatically-operated

valve connected with said pipe, and means of communication between said pipe and radiator end, substantially as and for the purpose set forth.

5. The combination with a steam-radiator, or the like, and an evaporator vessel, of a pipe within said vessel having its discharge end below the normal water-level and in communication at its opposite end with said radiator, an automatically-operated valve for regulating the discharge from said pipe and determining the normal water-level, and a check-valve in the course of said pipe for preventing back siphonage in case of a vacuum in said radiator, substantially as and for the purpose set forth.

6. The combination with a radiator, of an evaporator vessel, a pipe communicating with said vessel and having its discharge end beneath the water-level of said vessel, a float-controlled valve regulating the steam-flow, and a union *H* joining said pipe to said radiator and provided with a check-valve *G* and screw-valve *F*, substantially as and for the purpose set forth.

7. The combination with a radiator of the form described, of an evaporator vessel having a longitudinally-hollowed bottom conforming to the radiator-top and provided at its ends with downward extensions for securing it to the radiator, curved *F* projecting inwardly from said extensions into the air-space *a* of the radiator, a pipe within said vessel communicating with said radiator, and a valve for controlling the steam-passage through said pipe, substantially as and for the purpose set forth.

8. The combination with a radiator *A*, of an evaporator vessel *B* provided at its top with perforations and guides, a slide provided with perforations capable of registering with said first-named perforations, and valve-controlled pipe communication between said vessel and radiator, substantially as and for the purpose set forth.

697,660. WINDING-MACHINE. MICHAEL I. PUGH, New York, N. Y., and SAMUEL W. BALAN, Montreal, N. J. Filed Aug. 21, 1901. Serial No. 73,955. (No model.)

Claim.—1. In a machine for winding wire on annular cores, the combination of a wire carrying and winding device, a movable clamp for the annular core, a fixed bearing for the clamp, and a motion-transmitting mechanism geared with the wire carrying and winding device and with the clamp for the annular core, substantially as described.

2. In a machine for winding wire on annular cores, the combination of a wire carrying and winding device, a fixed bearing for the wire carrying and winding device, a movable clamp for the annular core, a fixed bearing for the clamp, and a motion-transmitting mechanism geared with the wire carrying and winding device and with the clamp for the annular core, substantially as described.

3. In a machine for winding wire on annular cores, the combination of a wire carrying and winding device, a movable clamp for the annular core, a fixed bearing for the clamp, and a motion-transmitting mechanism geared with the wire carrying and winding device and through a reversing mechanism with the clamp for the annular core, substantially as described.

4. In a machine for winding wire on annular cores, the combination of a wire carrying and winding device, a movable clamp for the annular core, a fixed bearing for the clamp, a motion-transmitting mechanism geared with the wire carrying and winding device and through a reversing mechanism with the clamp for the annular core, a quick-acting device for throwing the reversing mechanism, and a slow-acting device operatively connected to the clamp for the annular core and operating to throw the quick-acting device into engagement, substantially as described.

5. In a machine for winding wire on annular cores, the combination of a wire carrying and winding device, a motion-transmitting mechanism geared therewith, a clamp on the wire carrying and winding device for the end of the wire while being wound thereon, and means for releasing the clamp while the wire is on the wire carrying and winding device, substantially as described.

697,661. AUTOMATIC VENDING-MACHINE. JAMES J. REED,
New Philadelphia, Ohio. Filed Apr. 13, 1901. Serial No. 65,780. (No
model.)

Claim.—A vending-machine comprising a cabinet having a series of vertical magazines provided at their upper ends with means for supporting packages containing the articles to be vended, some of the magazines being vertically subdivided below the packages to separate the goods into groups, an independent coin-actuated mechanism for each compartment, comprising a plunger, certain of the plungers having spaced portions to correspond with the subdivisions of the respective compartments in which they work, and a single operating-rod for actuation of any selected coin-actuated mechanism to effect a delivery of the goods, substantially as described.

697,662. COMBINATION SAFETY REGULATING AND DRAIN VALVE. ARTHUR E. REED, Lebanon, Pa. Filed Sept. 21, 1901. Serial No. 76,057. (No model.)

Claim.—1. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable valve in said casing and arranged to keep the passage therethrough closed in the absence of pressure, a regulating device for controlling said valve, said device being movable independently of said valve and arranged to project into the path of movement thereof, and means for varying the position of the regulating device to vary the extent to which the valve may open.

2. In a hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable valve in said casing and arranged to keep the passage therethrough closed in the absence of pressure, and a yielding regulating device for controlling said valve, said device being disconnected from said valve and arranged to project into the path of movement thereof and having a tendency under normal pressure to keep the valve closed.

3. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable valve in said casing and arranged to keep the passage therethrough closed in the absence of pressure, a yielding regulating device for controlling said valve, said device being movable independently of said valve and arranged to project into the path of movement thereof and having a tendency under normal pressure to keep the valve closed, and means for varying the position of the regulating device to vary the extent to which the valve may open.

4. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable valve in said casing and arranged to keep the passage therethrough closed in the absence of pressure, a movable pressure device disconnected from said valve and having a tendency under normal pressure to keep the valve closed, and means for varying the position of said pressure device to vary the extent to which the valve may open.

5. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable valve in said casing and arranged to keep the passage closed in the absence of pressure, a regulating device arranged to bear on said valve, said device being provided with a passage for normally maintaining atmospheric pressure on the valve, and means for varying the position of the regulating device to vary the extent to which the valve may open.

6. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable valve in said casing and arranged to keep the passage closed in the absence of pressure, and a yielding regulating device arranged to bear on said valve, said device being provided with a passage for normally maintaining atmospheric pressure on the valve.

7. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable main valve in said casing and arranged to keep the passage closed in the absence of pressure, a movable hollow regulating-valve seated on said main valve and having communication with the atmosphere, whereby atmospheric pressure is maintained on one side of said main valve, and means for varying the position of the regulating-valve.

8. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable main valve in said casing and arranged to keep the passage closed in the absence of pressure, and a freely-movable hollow regulating-valve adapted to be seated on said main valve and having communication with the atmosphere, whereby atmospheric pressure is maintained on one side of said main valve, said regulating-valve under normal pressure serving to keep the main valve closed.

9. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable valve in said casing and arranged to keep the passage closed in the absence of pressure, a regulating device disconnected from and lying in the path of movement of said valve, a counterweighted lever connected to said regulating device, and means for adjusting the position of said lever for varying the position of the regulating device.

10. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable valve in said casing and arranged to keep the passage closed in the absence of pressure, a regulating device disconnected from and projecting into the path of movement of said valve, and a dash-pot for controlling the movements of said regulating device.

11. A hot-blast-regulating and safety valve for blast-furnaces designed to be placed in a by-pass from the cold-blast main to the hot-blast main, the same comprising a casing having a passage therethrough, a freely-movable valve in said casing and arranged to keep the passage closed in the absence of pressure, a guide and indicating rod connected to said valve and projecting through the valve-casing, a regulating device movable independently of said valve and projecting into the path of movement thereof, and means for varying the position of the regulating device to vary the extent to which the valve may open.

697,663. CRACKER-MACHINE. JOHN EMMERTSON, St. Louis, Mo. Filed Feb. 17, 1906. Serial No. 94,022. (No model.)

Claim.—1. In a cracker-machine, the combination of a pair of rolls, a carrier arranged to travel toward the forward end of the machine and extending rearwardly beyond the location of said rolls, and a delivery-table arranged forward of said rolls and from which the dough to be rolled is delivered to said rolls to pass therethrough in one direction and be deposited from said rolls onto said carrier in the opposite direction from that of its passage through the rolls, substantially as described.

2. In a cracker-machine, the combination of a pair of rolls, a carrier arranged to travel toward the forward end of the machine and extending rearwardly beyond the location of said rolls, a delivery-table arranged forward of said rolls and from which the dough to be rolled is

delivered to said rolls to pass through in one direction and to be deposited from said rolls onto said carrier in the opposite direction from that of its passage through the rolls, and a knife adapted to bear against the lowermost of said rolls and separate the dough therefrom and cause it to fall upon said carrier beneath said roll, substantially as described.

697,664. TRUNK-ROLLER. RALPH V. BARR, Johnstown, Pa.
Filed Oct. 18, 1906. Serial No. 78,814. (No model.)

Claim.—1. An improved roller of the class described, comprising a body portion and a tie-bar fitted together at their ends, and a separate hollow malleable cast member provided with longitudinal and transverse partitions and with lugs at the bottom to receive the roller-springs and secured below the tie-bar at the joint, said separate member having its upper surface curved complementary to the under surface of the tie-bar adjacent to its ends to form a bearing-surface for each tie-bar whereby the strain is taken partly off the rivets and borne by said separate member.

2. An improved roller of the class described, comprising a flanged body portion, a tie-bar having its ends fitted against the base of the body portion between a pair of its flanges, a center strut composed of a section of an I-beam, and a hollow malleable casting having its top fitted against the lower face of the tie-bar at the joint and having its upper surface curved complementary to the under surface of the tie-bar adjacent to its ends to form a bearing-surface for each tie-bar whereby the strain is taken in part by each casting, rivets extending through the body portion, the tie-bar and the top of the casting, and rivets extending through the flanges of the body portion and the sides of the casting.

697,665. STOVE-FIXTURE. HENRY E. BARRETT, Chicago, Ill.
Filed July 14, 1906. Serial No. 58,606. (No model.)

Claim.—1. In a display-rack for merchandise, the combination with a suitable supporting rack or cabinet provided with supporting ropes or cables, of a shaft provided with a pair of pulleys keyed to said shaft and cooperating with said ropes, one of said pulleys having a recess and an auxiliary controlling-pulley having a belt horizontally movable therein and adapted to engage one of said fixed pulleys, means to normally throw said belt into engagement with the recess in said fixed pulley, a fixed bracket upon the opposite side of the movable pulley having a recess corresponding to the location of said belt and additional means to overcome the normal tendency of said belt and thrust it into the recess in said bracket as desired by the operator all combined substantially as specified and for the purpose set forth.

2. The herein-described controlling mechanism for display-racks comprising a shaft 22, a pair of fixed pulleys keyed thereon, one of said pulleys having a recess, means supported from said pulleys, an auxiliary pulley having a belt adapted to normally engage the recess in said fixed pulley, a bracket having a recess opposite said belt and a cam-controlling belt, means for moving the cam at right angles to said first-mentioned belt whereby the said auxiliary and fixed pulleys may be locked together substantially as described.

3. In a display-rack, the combination with a rotatable shaft, a pulley fixed thereon and having a recess parallel with its shaft, a bracket with a recess in alignment with that of the pulley, a pulley loose on said

shaft and having a recess in alignment with the recess of the fixed pulley and a recess at right angles thereto, a belt movable in the first-mentioned recess, a belt movable at right angles thereto, a fixed support for the last-mentioned belt and a spring acting on said belt and a rack suspended from said pulleys substantially as described.

4. The combination with a spring-actuated shaft and a pulley thereon having an aperture, of a belt adapted to engage in said aperture, a spring-actuated rope-controlled belt, movable at right angles to said first-mentioned belt, a fixed support therefor, a bracket having an aperture in line with the aperture of the pulley, a spring acted in the pulley and acting on the first-mentioned belt and a controlling-rope and hoisting and lowering ropes for the rack wound upon said pulleys, all substantially as herein shown and described.

697,666. CONDENSER. FREDERICK BARRETT, Chicago, Ill.
Filed Feb. 8, 1906. Serial No. 61,657. (No model.)

Claim.—1. A condensing apparatus provided with a vacuum-pump with the open end of its cylinder projecting into the condensing-chamber, means being provided for establishing communication between the interior of the condensing-chamber and the cylinder when the piston within the cylinder is at one end of its stroke, whereby as the piston is returned the air admitted to the cylinder may be forced out, substantially as described.

2. A condensing apparatus provided with a vacuum-pump with the open end of its cylinder projecting into the condensing-chamber, means being provided for establishing communication between the interior of the condensing-chamber and the cylinder when the piston within the cylinder is at one end of its stroke, whereby as the piston is returned the air admitted to the cylinder may be forced out, the head of the cylinder being provided with valve mechanism for permitting the egress of the air that is to be exhausted and preventing the ingress of atmospheric air, substantially as described.

3. In a condensing apparatus, the combination with a condensing-chamber, of a pump-cylinder through which the condensed fluid may be forced, the pump-cylinder being provided with communicating means affording communication between the interior of the condensing-chamber and the cylinder when the piston within the cylinder is at the corresponding end of its stroke, whereby fluid may pass from the condensing-chamber into the cylinder, whereupon said fluid may be forced away upon the reverse reciprocation of the piston, a vacuum-pump in direct communication with the condensing-chamber, and a common actuating device for effecting the operation of the vacuum and fluid pumps, substantially as described.

4. In a condensing apparatus, the combination with a condensing-chamber, of a pump-cylinder through which the condensed fluid may be forced, the pump-cylinder being provided with communicating means affording communication between the interior of the condensing-chamber and the cylinder when the piston within the cylinder is at the corresponding end of its stroke, whereby fluid may pass from the condensing-chamber into the cylinder, whereupon the said fluid may be forced away upon the reverse reciprocation of the piston, a vacuum-pump having its cylinder communicating directly with the interior of the condensing-chamber, and a common actuating device for effecting the operation of the vacuum and fluid pumps, substantially as described.

5. In a condensing apparatus, the combination with a condensing-chamber, of a pump-cylinder through which the condensed fluid may be forced, the pump-cylinder being provided with communicating means affording communication between the interior of the condensing-chamber and the cylinder when the piston within the cylinder is at the corresponding end of its stroke, whereby fluid may pass from the condensing-chamber into the cylinder, whereupon the said fluid may be forced away upon the reverse reciprocation of the piston, a vacuum-pump with its cylinder projecting into the condensing-chamber, means being provided for establishing communication between the interior of the condensing-chamber and the cylinder when the piston within the cylinder is at one end of its stroke, whereby as the piston is returned the air admitted to the cylinder may be forced out, and a common actuating device for effecting the operation of the vacuum and fluid pumps, substantially as described.

6. In a condensing apparatus, the combination with a condensing-chamber, of a pump located in communication with the bottom of said condensing-chamber for withdrawing the water of condensation, and a separate vacuum-pump located at the top of said condensing-chamber for exhausting the air, and means whereby both of said pumps may be operated by the same prime mover, substantially as described.

7. A condensing apparatus provided with a condensing-chamber, a vacuum-pump having the open end of its cylinder in direct communication with the condensing-chamber, and means independent of said vacuum-pump for withdrawing condensed fluid from said condensing-chamber, substantially as described.

8. A condensing apparatus provided with a condensing-chamber, a vacuum-pump having the open end of its cylinder communicating directly with the interior of the condensing-chamber, and means independent of said vacuum-pump for withdrawing the liquid of condensation from said condensing-chamber, substantially as described.

9. A condensing apparatus provided with a condensing-chamber, a vacuum-pump in direct communication with the condensing-chamber, means independent of said vacuum-pump for effecting a withdrawal of fluid of condensation from said condensing-chamber, and a reservoir partially inclosing said vacuum-pump through which condensing liquid is adapted to pass, substantially as described.

10. A condensing apparatus provided with a condensing-chamber, a vacuum-pump having its cylinder communicating directly with the interior of the condensing-chamber, means independent of said vacuum-pump for effecting a withdrawal of fluid of condensation from said condensing-chamber, and a reservoir partially inclosing said vacuum-pump through which condensing liquid is adapted to pass, substantially as described.

11. A condensing apparatus provided with a condensing-chamber, a vacuum-pump in direct communication with the condensing-chamber, means independent of said vacuum-pump for effecting a withdrawal of fluid of condensation from said condensing-chamber, a reservoir partially inclosing said vacuum-pump through which condensing liquid is adapted to pass, and means in communication with said reservoir for spraying condensing liquid into said condensing-chamber, substantially as described.

12. A condensing apparatus provided with a condensing-chamber, a vacuum-pump having its cylinder communicating directly with the interior of the condensing-chamber, means independent of said vacuum-pump for effecting a withdrawal of fluid of condensation from said condensing-chamber, a reservoir partially inclosing said vacuum-pump through which condensing liquid is adapted to pass, and means in communication with said reservoir for spraying condensing liquid into said condensing-chamber, substantially as described.

13. In a condensing apparatus, the combination with a condensing-chamber, of pumping means located at the top of and in communication with said condensing-chamber into which air is adapted to enter which is thereafter removed therefrom through the agency of said pumping means, a pump into which liquid of condensation is adapted to enter to be thereafter removed therefrom through the agency of said pumping mechanism, and means for simultaneously operating both pumps, substantially as described.

14. In a condensing apparatus, the combination with a condensing-chamber, of a pump located at the top of and projecting into said condensing-chamber, and a piston for said pump one end of said pump-cylinder being in constant communication with the said condensing-chamber, the remaining end of said cylinder being adapted for periodic communication with the said condensing-chamber, substantially as described.

15. In a condensing apparatus, the combination with a condensing-chamber, of a pump located at the top of and projecting into said condensing-chamber, a piston for said pump, one end of said pump-cylinder being in constant communication with the said condensing-chamber, the remaining end of said cylinder being adapted for periodic communication with the said condensing-chamber, and pumping means for removing condensed liquid from said condensing-chamber, substantially as described.

16. The combination with a condensing-chamber, of a vacuum-pump having its cylinder projecting within the condensing-chamber, a reservoir for condensing liquid, inclosing the said vacuum-pump, means for spraying the condensing liquid into the condensing-chamber, and a pump for effecting the egress of liquid of condensation from the said condensing-chamber, substantially as described.

17. The combination with a condensing-chamber, of a vacuum-pump having its cylinder projecting within the condensing-chamber, a reservoir for condensing liquid, inclosing the said vacuum-pump, means for spraying the condensing liquid into the condensing-chamber, a pump for effecting the egress of liquid of condensation from the said condensing-chamber, and means for effecting a simultaneous operation of both pumping means, substantially as described.

897,867. THILL-COUPLES. WALTER F. SHAWVER, Schenectady, N. Y. Filed Jan. 26, 1901. Renewed Jan. 14, 1902. Serial No. 28,778. (No model.)

Claim.—1. In an adjustable thill-coupling, the combination with clip C having the lower ends of its links, respectively, provided with a pivot-hole which is in alignment with that of the other, and having integral with one of said links forwardly-projected perforated lugs adapted to receive between them a thill-iron, of a tie-plate having vertical perforations through which the perforated end portions of said links of the clip freely pass to a distance above the pivot perforations therein, a cam provided with an arm for operating it in either direction and having through it a suitable pivot-receiving perforation, and a pivot through the perforations in the lower ends of the links of the clip and said cam, as set forth.

2. In an adjustable thill-coupling the combination with clip C having a recessed seat in its bow portion from its under side, and having integral with one of its vertical links a pair of perforated lugs between which a thill-iron may be received, and having in the lower end of each link a pivot-hole, said a pivot supported from said holes in said links, of a tie-plate having vertical perforations receiving the lower ends of said links of the clip, a cushion in the recessed form-seat in the bow portion of the clip and a cam pivoted between the lower ends of the links of the clip and below the said tie-plate and adapted to be operated as to force the latter upward in direction toward the said bow of the clip and at pleasure operated in reversed direction for allowing said tie-plate to move downward in direction from said bow, as set forth.

3. In an adjustable still-coupling the combination with clip *C* having in its lower portion a recessed seat, and having in the lower ends of its side limbs perforations in alignment, and a cushion in said seat adapted to prevent the said bow portion of the clip moving the axle-bed at said bow portion, of a tie-plate provided with vertical perforations through which the perforated lower end portions of the said limbs of the clip are freely passed, an elastic cushion between the said tie-plate and the bow portion of the clip, and a cam provided with a suitable operating-arm between the perforated lower ends of the said limbs of the clip and below the tie-plate, and a pivot holding said cam jointed on said lower portions of said limbs, as set forth.

4. In an adjustable still-coupling, the combination with clip *C* having in the lower ends of its side limbs perforations which are in alignment, a tie-plate provided with vertical perforations which freely receive the said lower end portions of said limbs, and having in its upper side and between the said vertical perforations a recessed seat, of an elastic cushion seated in said seat, a cam provided with an operating-arm and a pivot jointing said cam on the lower ends of the said limbs of the clip, the cam being adapted to be operated at pleasure to force said tie-plate toward the bow of said clip and said cushion being adapted to move said tie-plate in opposite direction, as set forth.

5. The combination with an axle of a vehicle, of a pair of perforated lugs for receiving between them a still-iron, a clip holding said lugs connected to the axle, a tie-plate provided with vertical openings which freely allow the lower end portions of the limbs of the clip to have passage through the said tie-plate, a cam provided with an operating-arm, a pivot pivoting said cam between the lower ends of said clip-limbs and beneath said tie-plate and adapting the said cam to force the said tie-plate upward for clamping the axle and at pleasure loosening the same and an elastic cushion adapted to force said tie-plate, when loosened, to move relatively down toward the pivot of said cam as set forth.

697,668. PAPER BOX. FRANK J. SCHLESINGER, St. Louis, Mo., assignor to the St. Louis Paper Box Company, St. Louis, Mo., a Corporation. Filed Dec. 24, 1900. Serial No. 69,000. (No model.)

Claim.—1. A box comprising side walls, flaps forming an end wall, a portion of said flaps being provided with a slit, and one of said flaps being provided within the side edges thereof with a tongue having a rounded corner on one side, and an auxiliary folding tongue projecting forwardly from the other side of the main tongue and in a line therewith.

2. A box comprising side walls, flaps forming an end wall, a portion of said flaps being provided with slits, and one of said flaps being provided within the side edges thereof with main tongues curved upon opposite sides of said flaps and extending outwardly therefrom, each main tongue having a rounded corner on one side and an auxiliary folding tongue projecting forwardly from the other side of the main tongue, and in a line therewith.

3. A box comprising side walls, flaps forming an end wall of the box, a portion of said flaps being provided with slits; and one of said flaps having in its free corners provided within the side edges thereof with tongues extending outwardly therefrom in opposite directions and a cut-away portion extending from one tongue to the other.

4. A box comprising side walls; two flaps disposed opposite one another on one end of the side walls and provided with slits; a third flap provided with slits and having main tongues curved upon opposite sides of the flap and extending outwardly therefrom; each main tongue having a rounded corner on one side and an auxiliary folding tongue projecting forwardly from the other side of the main tongue and in a line therewith; and a fourth flap curved opposite the third flap and having tongues adapted to enter the slits in said third flap.

697,669. COMBINED CURRENT AND BURN-FORM. CHARLES E. SHERMAN, Aurora, Ill. Filed June 14, 1900. Serial No. 59,300. (No model.)

Claim.—A garment comprising a lower tight-fitting or corset portion and an upper loose or bust-form portion, and consisting of two halves or sections adapted to be joined together at their rear, and detachably joined at their front edges, and which are provided at the sides of their front portions with shoulder extensions terminating in shoulder-stays, said sections being provided with vertical stays and in their upper or bust portions with transverse stiffening-strips which form with the stays a stiffening means by which the loose bust portions of the sections are held in shape; said vertical stays in the front part of the sections being extended from bottom to top of the sections through said bust portions and to the upper ends of the shoulder extensions to afford continuous stiffened connection between the said bust portion and both the lower corset portion and the stiffened shoulder extensions, and said sections being also provided, at the front edges of the lower corset portions thereof, with studs and eyes, or like fastenings, which are held in engagement by the tension of the parts when drawn around the body and at the front edges of the upper or bust-form portions thereof with detachable fastenings adapted to hold said edges from spreading apart and also from overlapping under external pressure on the form tending to collapse the same.

697,670. ALTERNATING-CURRENT MOTOR. FRANK SCHMIDTKE, Berlin, Germany, assignor to Siemens & Halske Electric Company of America, Chicago, Ill., a Corporation of Illinois. Filed Jan. 9, 1900. Serial No. 590. (No model.)

Claim.—1. In an alternating-current system of distribution, the combination with an alternating-current generator, of transmission means, a voltmeter for measuring the energy of said system of distribution, said motor comprising a series field-coil for creating a field varying in phase and magnitude with the current of the said system, a closed circuit conductor associated with said series field-coil and receiving its current solely by induction for causing the phase of the field due thereto to lag with respect to the current in the system, a pressure field-winding adapted for induction with said system, and means for causing the phase of the field due thereto to lead with respect to the pressure of the system, whereby

a phase rotation of substantially ninety degrees is obtained between the series and pressure fields, substantially as described.

2. In an alternating-current system of distribution, the combination with an alternating-current generator, of transmission means, a wattmeter for measuring the energy of said system of distribution, said meter comprising a series field-coil for creating a field varying in phase and magnitude with the current of the said system, a closed-circuited conductor associated with said series field-coil and receiving its current solely by induction for causing the phase of the field due thereto to lag with respect to the current in the system, a pressure field-winding adapted for induction with said system, and a condenser in series with said pressure field-winding for causing the phase of the field due thereto to lead with respect to the pressure of the system, whereby a phase rotation of substantially ninety degrees is obtained between the series and pressure fields, substantially as described.

3. In an alternating-current system of distribution, the combination with an alternating-current generator, of transmission means, a wattmeter for measuring the energy of said system of distribution, said meter comprising a series field-coil for creating a field varying in phase and magnitude with the current of the said system, a closed-circuited conductor associated with said series field-coil and receiving its current solely by induction for causing the phase of the field due thereto to lag with respect to the current in the system, a pressure field-winding adapted for induction with said system, a condenser in series with said pressure field-winding for causing the phase of the field due thereto to lead with respect to the pressure of the system, whereby a phase rotation of substantially ninety degrees is obtained between the series and pressure fields, and an adjusting impedance in circuit with said pressure-field-winding circuit, substantially as described.

697,671. ALTERNATING-CURRENT METER. FRANK SCHMIDTKE, Berlin, Germany, assignor to Siemens & Halske Electric Company of America, Chicago, Ill., a Corporation of Illinois. Filed Feb. 12, 1900. Serial No. 4,500. (No model.)

Claim.—1. In a wattmeter for balanced three-phase systems of distribution, the combination with a movable measuring element, of a series winding inductively associated with said movable measuring element, a pressure-winding also inductively associated with said movable measuring element, and a closed-circuited secondary winding receiving its current inductively from said series winding, the magnetic field due to the said pressure-winding being displaced nearly ninety degrees from its impressed pressure, substantially as described.

2. In a wattmeter for balanced three-phase systems of distribution, the combination with a movable measuring element, of a series winding inductively associated with said movable measuring element, a pressure-winding also inductively associated with said movable measuring element, and a short-circuited secondary winding receiving its current inductively from said series winding, the magnetic field due to the said pressure-winding being displaced nearly ninety degrees from its impressed pressure, substantially as described.

3. In a wattmeter for balanced three-phase systems of distribution, the combination with a movable measuring element, of a series winding inductively associated with said movable measuring element, a pressure-winding also inductively associated with said movable measuring element, a short-circuited secondary winding receiving its current inductively from said series winding, the magnetic field due to the said pressure-winding being displaced nearly ninety degrees from its impressed pressure, and an impedance-winding in circuit with said pressure-winding, substantially as described.

4. In a balanced three-phase system of distribution, the combination with a source of current, of a wattmeter comprising a movable measuring element, a series winding inductively associated with said movable measuring element, a closed-circuited secondary winding for said series winding, and a pressure-winding also in inductive relation with said movable measuring element and receiving its current from the conductor of the system including the series winding and one of the remaining conductors, substantially as described.

5. In a balanced three-phase system of distribution, the combination with a source of current, of a wattmeter comprising a movable measuring element, a series winding inductively associated with said movable measuring element, a closed-circuited secondary winding for said series winding, a pressure-winding also in inductive relation with said movable measuring element and receiving its current from the conductor of the system including the series winding and one of the remaining conductors, and an impedance-winding in series with said pressure-winding, substantially as described.

6. In a balanced three-phase system of distribution, the combination with a source of current, of a wattmeter comprising a movable measuring element, a series winding inductively associated with said movable measuring element, means for lagging the phase of the effective magnetic field due to said series winding, and a pressure-winding also in inductive relation with said movable measuring element and receiving its current from the conductor of the system including the series winding and one of the remaining conductors, substantially as described.

697,672. BOTTLE-CAPPING MACHINE. WILLIAM H. SHERT, Ottawa, Canada. Filed Nov. 2, 1891. Serial No. 32,300. (No model.)

Claim.—1. In a bottle-capping machine, the combination of a base, a cap-receiver mounted upon said base, a plunger, a casing mounted upon said base to support the plunger, a foot-slide supported by said base and operatively connected with the plunger to transfer the lowermost cap in the receiver into position beneath the plunger and two flat, spring-fingers vertically disposed within said casing on opposite sides of the path of the foot-slide to receive and yieldingly hold the cap transferred by the foot-slide, substantially as shown and described.

2. In a bottle-capping machine, the combination of a base, a cap-receiver mounted upon said base, a plunger, a casing mounted upon said base and supporting the plunger, a foot-slide supported by said base and operatively connected with the plunger to transfer the lowermost cap in the receiver into position beneath the plunger, said slide having a forwardly-projecting tongue to support the cap, and two flat, spring-fingers vertically disposed within the casing on opposite sides of the path of the foot-slide to receive and yieldingly hold the cap when the slide and tongue are withdrawn, substantially as shown and described.

697,673. FRUIT-JAR. LEROY VAN SUREN, Louisville, Mo. Filed Nov. 27, 1891. Serial No. 32,300. (No model.)

Claim.—In a fruit-jar, the combination with a casing consisting of upper and lower sections, of an interposed screen-section having a pin-and-cocket connection with the upper and lower casing-sections, said

screen-section embodying three superposed screens, the intermediate one of which is removable, substantially as set forth.

697,674. AUTOMATIC TROLLEY-CATCHER. THOMAS E. SHANAHAN, Gloversville, N. Y. Filed Aug. 7, 1901. Serial No. 71,193. (No model.)

Claim.—1. An automatic trolley-catcher, consisting of a fixed casing or shell, a spring-controlled drum mounted to turn in the said shell or casing, the drum being adapted to carry one end portion of a trolley-pole rope, a spring-controlled barrel independently mounted within the said drum, means for laterally shifting the said drum, means from the drum and barrel, which means are brought in the path of each other when the drum is shifted in one direction, and locking device for the spring-controlled barrel, controlled by the shifting movement of the drum, for the purpose described.

2. An automatic trolley-catcher, consisting of a fixed casing or shell, a shaft, a drum mounted loosely on the said shaft and adapted to carry a portion of the trolley-pole rope, a spring secured to the shaft and to the drum, which spring is of sufficient strength to take up the slack of the trolley-pole rope, a barrel mounted on the said shaft within the drum, a spring within the said barrel, acting in the same direction as the spring in the drum, but of greater strength, extensions from the barrel and the spring-containing portion of the drum, which extensions are adapted to be brought one in the path of the other when the drum is shifted sideways, a spring-controlled bearing for one end of the shaft, having lugs which normally enter an opening in a side of the barrel, a cam carried by the shaft, having bearing against the drum, and a lever provided with a head having an inclined surface, which inclined surface is in engagement with the said cam, whereby through the movement of the lever the shaft upon which the barrel and drum are mounted is given and movement, as set forth.

3. An automatic trolley-catcher, consisting of a fixed casing or shell, a shaft, a drum mounted loosely on the said shaft and adapted to carry a portion of the trolley-pole rope, a spring secured to the shaft and to the drum, which spring is of sufficient strength to take up the slack of the trolley-pole rope, a barrel mounted on the said shaft within the drum, a spring within the said barrel, acting in the same direction as the spring in the drum but of greater strength, extensions from the barrel and the spring-containing portion of the drum, which extensions are adapted to be brought one in the path of the other when the drum is shifted sideways, a spring-controlled bearing for one end of the shaft, having lugs which normally enter an opening in a side of the barrel, a cam carried by the shaft, having bearing against the drum, a lever provided with a head having an inclined surface, which inclined surface is in engagement with

the said cam, whereby through the movement of the lever the shaft upon which the drum and barrel are mounted is given and movement, a spindle extending from the lever within the said shell or casing, the free end of the lever extending out through a slot in the said shell or casing, a friction-pulley carried by the said spindle and located over the peripheral portion of the drum, over which pulley the trolley-pole rope carried by the drum is adapted to pass, and a spring coiled around the said shaft, having bearing against the said barrel and against a partition in the drum, the spring serving normally to hold the barrel in position to be locked and its extensions out of the path of the extensions carried by the spring-section of the drum.

697,675. BI-CYCLES DRIVING-GEAR. ARTHUR E. SHANK, Union, Ohio. Filed Dec. 4, 1901. Serial No. 94,961. (No model.)

Claim.—1. In a bicycle or like machine, and in combination with the drive-wheel and crank-axis, a drive-shaft for transmitting motion from the crank-axis to the drive-wheel, the same composed of sections arranged out of line, and speed-gearing connecting the proximal ends of the drive-shaft sections, substantially as set forth.

2. In a bicycle or like machine, the frame having a lower side run composed of tubular sections arranged out of line, rigid connection between the proximal ends of the said sections, the drive-wheel and crank-axis, a drive-shaft between the drive-wheel and crank-axis composed of parts passing through the respective sections of the aforementioned side run, and speed-gearing connecting the proximal ends of the drive-shaft sections, substantially as set forth.

3. In a bicycle or like machine, the frame having its lower side run composed of tubular sections arranged out of line, a fork rigidly attached to the rear end of a section and having the rear end of its upper member connected with the lower end of the proximal rear fork member, yokes connecting the upper and lower fork members at their rear ends and intermediate of their ends, the intermediate yokes forming a brace for the rear portion of the aforementioned side run, the drive-wheel and crank-axis, a sectional drive-shaft between the drive-wheel and crank-axis and having its parts located within the sections of the aforementioned side run, and speed-gearing connecting the proximal ends of the drive-shaft sections, substantially as specified.

697,676. TYPE-WRITING MACHINE. CHARLES E. SHAFER, Brooklyn, N. Y., assignor to Wyckoff, Seaman & Denodet, Inc., N. Y., a Corporation of New York. Filed Jan. 2, 1901. Serial No. 48,513. (No model.)

Claim.—1. In a type-writing machine, the combination of a carriage, a feeding-rack and platen therefor, a pivoted lever, and means co-operating with said lever for effecting minute longitudinal adjustment of the platen relatively to the feed-rack.

2. In a type-writing machine, as a means for adjusting the paper, the combination of a carriage, a feeding-rack therefor, a lever and cam interposed between said rack and carriage for adjusting one relatively to the other.

3. In a type-writing machine, the combination of a carriage, a feeding-rack therefor, a cam supported upon one of said carriage-and-rack elements, and a co-operating shoe pivoted upon the other of said carriage-and-rack elements.

4. In a type-writing machine, as a means for adjusting the paper, the combination of a carriage, a feeding-rack therefor, an intermediate cam, a set of ratchet-teeth, and a pawl.

5. In a type-writing machine, the combination of a carriage, a feeding-rack therefor, an intermediate pivoted cam whose working edge is provided with ratchet-teeth, and a pawl adapted to said teeth.

6. In a type-writing machine, the combination of a carriage, a feeding-rack therefor, an intermediate pivoted cam-lever whose working edge is provided with ratchet-teeth, and a pivoted shoe opposed to said cam, one point of said shoe being adapted to enter said teeth to detain said cam-lever in its adjusted position.

7. In a type-writing machine, the combination of a carriage, means for adjusting said carriage through minute distances in later-space direction and holding it in its adjusted position, and means for automatically releasing the carriage from the control of said adjusting means.

8. In a type-writing machine, the combination of a carriage, means for adjusting said carriage through minute distances in later-space direc-

tion, and means operating automatically at the return of the carriage to the beginning of the line, for releasing said carriage from the control of said adjusting means.

9. In a type-writing machine, the combination of a carriage, a feed-rack therefor, said carriage being movable relatively to said rack in a longitudinal direction, a cam-lever having ratchet-teeth and mounted upon said rack, a pawl mounted upon said carriage, and a stop for arresting said rack during the final portion of the return movement of the carriage for beginning a new line, whereby said cam-lever and said pawl are separated.

10. In a type-writing machine, the combination of a carriage, also 20 pivoted thereon, a rack relatively to which said carriage is movable, lever 27 pivoted upon said rack and having teeth 29 formed upon its working end edge 24, steps 27' and 25 upon said lever, and stop 23 for arresting said rack.

11. In a type-writing machine, the combination of a cylindrical platen, a line-space wheel, a spring-pressed detent for said wheel and which is normally in contact therewith, and means for adjusting the spring of said detent through minute distances.

12. In a type-writing machine, the combination of a carriage, a feed-rack which is carried by said carriage, the carriage and feed-rack being movable independently one of the other in the direction of the travel of the carriage and hand-operated means for adjusting the carriage relatively to the feed-rack and in the direction of the travel of the carriage for fractions of a letter-space distance.

13. In a type-writing machine, the combination of a carriage, a feed-rack which is carried by said carriage, the carriage and feed-rack being movable independently one of the other in the direction of the travel of the carriage, hand-operated means for adjusting the carriage relatively to the feed-rack and in the direction of the travel of the carriage for fractions of a letter-space distance, and means for automatically restoring the carriage and rack to their normal relative positions when the carriage is restored to the right to begin a new line of writing.

14. In a type-writing machine, the combination of a cylindrical platen, a line-space wheel, a detent which is normally in contact with said wheel, a spring which carries said detent, and a screw for adjusting said spring.

15. In a type-writing machine, the combination of a cylindrical platen, a line-space wheel, a platen-frame, an extensible spring-arm mounted upon said platen-frame, and a detent carried upon the free end of said arm and engaging said line-space wheel.

16. In a type-writing machine, the combination of a cylindrical platen, a line-space wheel, a spring-arm, a detent thereon, and a screw upon said arm for moving said detent minute distances.

17. In a type-writing machine, the combination of a platen, a line-space wheel, spring-arm 20, a portion of which is bent into U form, detent-collar 27, and transverse screw 43.

18. In a type-writing machine, the combination of a platen, a line-space wheel, spring-arm 20, a portion of which is bent into U form, detent-collar 27, transverse screw 43, and steps 45 and 42.

19. In a type-writing machine, the combination of a platen, a line-space wheel, spring device 20, 40, 41, 42, detent-collar 27, screw 43, screw 45, nut 46, and nut 47.

20. In a type-writing machine, the combination of a platen, a carriage, means for adjusting said carriage through fractions of a letter-space distance in the direction of the travel of the carriage and means for adjusting said platen through fractions of a line-space distance circumferentially, whereby the paper upon the platen may be adjusted in two directions relatively to the printing-center.

21. In a type-writing machine, the combination of a platen, a carriage therefor, hand-operated means for adjusting the carriage in the direction of its travel through fractions of a letter-space distance, and independent hand-operated means for turning the platen fractions of a line-space distance, whereby the platen may be adjusted in two directions at right angles to each other and relatively to the printing-point.

22. In a type-writing machine, the combination of a carriage, a platen carried thereby, a feed-rack which is carried by said carriage, the carriage and rack being movable independently one of the other in the direction of the travel of the carriage, hand-operated means for adjusting the carriage relatively to the feed-rack and in the direction of the travel of the carriage for fractions of a letter-space distance, and independent hand-operated means for turning the platen fractions of a line-space distance.

697,677. **HO-CLEAN INKER.** GEORGE W. BROWN, Rochester, N. Y., assignor to Anna B. Brown, Rochester, N. Y. Filed July 28, 1901. Serial No. 59,151. (No model.)

Claim.—In a device for the purpose set forth, the combination with the bowl and handle, of a series of blades pivoted within the bowl and adapted to sweep the inner wall thereof, a gear-engagement on the journal of said blades, a bifurcated lever pivoted to the upper face of the handle having the sides of its fork extending either side of the handle, said fork carrying a gear-engagement on the stem thereof which meshes with the gear-engagement of the blades and having depending plates on the ends of the fork sides adapted to engage the opposite edges of the handle to arrest the movement of said lever in both directions.

697,678. **TYPE-WRITING MACHINE.** FREDERICK SMITH, Chicago, Ill. Filed Dec. 7, 1902. Serial No. 26,009. (No model.)

Claim.—1. In a type-writer the combination of the type-bars, slidable toward a common center, means for causing said type-bars to shift

and strike having flaps operatively connected with said type-bars respectively and arranged in two opposite groups or series with a dividing-space between the series, key-levers corresponding in number to said flaps arranged in a single series or group without said dividing-space and intermediate levers connecting said flaps with said key-levers respectively, substantially as set forth.

2. In a type-writer the combination of the type-bars slidable toward a common center, means for causing said bars to shift and strike having flaps arranged in two opposite groups or series with a dividing-space between the series, key-levers corresponding in number to said flaps and arranged in a single group or series without said dividing-space and diagonally-arranged intermediate levers connecting said flaps with said key-levers respectively, substantially as set forth.

3. In a type-writer the combination of the type-bars, slidable toward a common center, the cam-plates 4, the flaps 2, the arms 2 operatively connecting said flaps and cam-plates with said type-bars, said flaps 2 being arranged in two groups one on each side of said common center, the key-levers 10 arranged in a single series equal distance apart, and the intermediate levers 6 connected at one end with said flaps 2 and inclined toward and connected with said key-levers respectively, substantially as set forth.

4. In a type-writing machine, the combination of angular type-bars having pivot-arms capable of turning and moving endwise and provided with fingers, slides having oblique slots engaging with the fingers on said arms, key-levers and auxiliary levers connected with said slides and by flaps with said key-levers, substantially as set forth.

697,679. **AIR-COOLING APPARATUS.** ALFRED BROWN, St. Louis, Mo. Filed Oct. 4, 1901. Serial No. 77,006. (No model.)

Claim.—1. In an air-cooling apparatus, a cooling-coil comprising a cell-chamber, having perforated and partitioned a cooling-coil arranged within the cell-chamber, partitioned between the fields of the coil, a receiving-chamber communicating through one of the perforated partitions with the cell-chamber and a discharge-chamber with which the cell-chamber communicates through the other perforated partition.

2. In an air-cooling apparatus, the combination of a cooling-coil comprising a cell-chamber having perforated and partitioned a cooling-coil arranged within the cell-chamber, partitioned between the fields of the coil, a receiving-chamber communicating through one of the perforated partitions with the cell-chamber, and a discharge-chamber with which the cell-chamber communicates through the other perforated partition; and an air-mixing chamber communicating with the discharge-chamber of the cooling-coil.

697,680. **VALVE.** WILLIAM F. SUMER, New York, N. Y., assignor to the Singer Automatic Ice Machine Company, of New Jersey. Filed May 1, 1901. Serial No. 54,905. (No model.)

Claim.—1. In a valve, the combination with a valve-body and connected pipe, of a field-chamber connected with the valve-body, a diaphragm therein, a valve, a valve-rod bearing against said diaphragm, means for lifting said valve from its seat, a diaphragm-chamber beyond the field-chamber, a diaphragm in said diaphragm-chamber and of greater area than said first diaphragm, a rod interposed between said diaphragms, regulatable means for exerting pressure upon the outer diaphragm and a pipe communicating with the outer portion of the diaphragm-chamber, substantially as set forth.

2. In a valve, the combination with a valve-body and connected pipe, of a field-chamber connected to the valve-body, a diaphragm therein, a valve, a valve-rod which at its upper end bears upon said diaphragm, a spring around the valve-rod interposed between the valve and diaphragm

for lifting the valve from its seat when fluid-pressure is exerted upon the diaphragm, a diaphragm-chamber beyond the field-chamber, a diaphragm dividing the same and of larger area than the aforesaid diaphragm, a rod interposed between the diaphragms, regulatable means for exerting pressure upon the outer diaphragm and a pipe communicating with the portion of the chamber beyond the diaphragm, substantially as set forth.

2. A valve-regulating device comprising with a valve-body and connected pipe, a valve and valve-rod, adjacent superposed field-chambers, diaphragms dividing the same and differing from one another in area, means for communicating the movement of one diaphragm to another, means for connecting the pipe and distant diaphragm-chamber, whereby the reduced pressure upon the diaphragm of greater area is employed for closing the valve, and a spring around the valve-rod and interposed between the valve and the first diaphragm for lifting the valve from its seat when fluid-pressure is exerted upon said first diaphragm, substantially as set forth.

4. In a valve, the combination with a valve-body 2 and connected pipes 1 and 11, of a fluid or diaphragm chamber 3 connected to the valve-body, a diaphragm 21 therein, a valve 22, a valve rod or stem 23 at its upper end bearing upon the diaphragm 21, a spring 25 around the valve-rod and interposed between the valve and diaphragm for lifting the valve from its seat when fluid-pressure is exerted upon the diaphragm 21, a large diaphragm-chamber 4, a diaphragm 41 extending substantially centrally through the same, the said diaphragm-chamber opening into the outer end of the diaphragm-chamber 3, a rod 42, a guide 43 therefor, said rod 42 extending between and connecting with the said diaphragms, an adjustable rod 45, a stuffing-box 47, and threaded aperture 44 through which the said rod 45 passes, a thrust-spring 46 between the diaphragm 41 and the rod 45, and a pipe 5 opening into the diaphragm-chamber 4, substantially as and for the purposes set forth.

697,681. **FRUIT-JAR CLOSER.** ARTHUR CHALKER, Rochester, N. Y. Filed Mar. 12, 1900. Serial No. 1,267. (No model.)

Claim.—1. A jar-chamber including a neck, a lid, a grooved sealing ring cast, an annular rib extending into the grooved neck, a sealing-ring, and a pressure-cap sliding relatively upon the rib.

2. In a jar-chamber, the combination of the neck, the exterior threads on the neck, the lid-support, the lid, the sealing-ring cast, the sealing-ring, the annular rib engaging the sealing-ring and frictionally retained thereby against rotation, the pressure-cap sliding relatively upon said rib, and the threads in said cap, substantially as set forth.

3. In a jar-chamber, the combination of the neck, the exterior threads on the neck, the straight plate portion above said threads, the lid-support, the lid, the sealing-ring cast, the sealing-ring, the annular rib engaging the sealing-ring and frictionally retained against rotation thereby, the pressure-cap sliding relatively upon said rib, the threads in said cap, and the curved groove in said cap above said threads, substantially as set forth.

697,682. **SCISSORING-MACHINE.** ARTHUR W. SUMER, New York, N. Y. Filed Jan. 14, 1900. Serial No. 99,045. (No model.)

Claim.—1. A brush-cutting machine having an overhanging jaw, a spring-actuated and pivoted lever connected to the brush-cutting

with a clamping-jaw and projecting finger, in combination with a suitable loop to engage the overhanging jaw and the clamping-jaw, said loop having means for connecting it to a suitable handle and provided with a suitable bearing to act against the projecting finger in depressing it for the purpose of releasing the handle, substantially as and for the purpose set forth.

2. A bracket for brush-heads having a depending flange, an overhanging jaw upon the bracket, a spring-actuated lever pivotally connected to the bracket and provided with a clamping-jaw and a projecting finger, a loop and bearing adapted for attachment to a suitable handle, substantially as and for the purpose specified.

3. A bracket for brush-heads, having an overhanging jaw, a lever provided with a clamping-jaw and a bearing finger at its outer end, said lever at its inner end having laterally-projecting pivot-pins having a rounded upper side and a flat under side, a spring bearing against the under side of the lever and performing the double function in holding the pins in engagement with their seats and rendering the lever spring-actuated, and a suitable loop and bearing adapted for attachment to a suitable handle, substantially as and for the purpose described.

697,688. CLUTCH. FRED L. SMITH, Franklin Falls, N. H. Filed May 14, 1901. Serial No. 90,312. (No model.)

Claim.—1. In combination in a clutch, two aligned shafts, a frictional member secured to one shaft, a connecting member secured to the other shaft and having a cylindrical rim surrounding the first member, a ring having a cylindrical outer face fitting within said rim and an inclined inner face adapted to make frictional contact with the frictional member, bolts connected with said ring and passing through the cylindrical member, and means for moving said bolts longitudinally, substantially as described.

2. In a clutch, the combination with two members secured to two aligned shafts, a wedge-shaped ring interposed between said members, bolts secured to said ring and passing through one of the members, and cam-plates on the latter; of a sleeve sliding on the hub of the last-mentioned member, radial levers connecting said sleeve with said bolts, and cams riding on said plates, as and for the purpose set forth.

3. In a clutch, the combination with two members secured to two aligned shafts, a wedge-shaped ring interposed between said members, bolts secured to said ring and passing through one of the members, cam-plates on the latter and lugs on the other member; of a sleeve sliding on the hub of the last-mentioned member, radial levers connecting said sleeve with said bolts, cams riding on said plates, and positive clutch devices connected with and operated by said levers and passing through said clutch member into engagement with the lugs on the other member, substantially as described.

4. In a clutch, the combination with two adjacent clutch members secured to two aligned shafts, a frictional clutch mechanism near their peripheries, a sliding sleeve, and radial levers connecting said sleeve with said mechanism for moving the latter; of lugs on the face of one member, plates connected with said levers and having cam-faces, and bolts moving in radial grooves in the other member and having lugs engaged by said cams, as and for the purpose set forth.

697,684. WIND-REPLENISHING LOOM. HARRY W. SMITH, North Grafton, Mass. Filed Sept. 20, 1901. Serial No. 75,619. (No model.)

Claim.—1. In a loom, filling-replenishing mechanism, an electric circuit having terminals, a shuttle provided with circuit-changing means exterior to the filling in the shuttle to change the circuit through the terminals and cause the said replenishing mechanism to be actuated when the filling is to be changed.

2. In a loom, filling-replenishing mechanism, an electric circuit having terminals, a shuttle provided with circuit-changing means exterior to the filling in the shuttle, and means controlled by the filling for rendering the circuit-changing means operative to change the circuit and cause the replenishing mechanism to be actuated when the filling is nearly exhausted.

3. In a loom, filling-replenishing mechanism, an electric circuit containing an electromagnet having a plurality of terminals exterior to the shuttle, a shuttle provided with circuit-changing means exterior to the filling in the shuttle, and a device to render said means inoperative by the presence and operative by the substantial absence of filling in the active shuttle to thereby control the actuation of the said replenishing mechanism.

4. In a loom, filling-replenishing mechanism, an electric circuit controlling said mechanism and having its terminals contained exterior to the shuttle, and a shuttle having mounted thereon circuit-changing means exterior to the filling in the shuttle, and adapted to close said circuit through said terminals upon the exhaustion of the filling in the shuttle to a predetermined extent.

5. In a loom, a filling-replenishing mechanism and means for controlling the time of its operation, said means comprising an electric circuit, a shuttle and means exterior to the filling in the shuttle for completing the circuit through the shuttle when the filling in the shuttle has become nearly exhausted.

6. In a loom, an electric circuit containing an electromagnet and having a plurality of terminals exterior to the shuttle, and a shuttle provided with circuit-closing means exterior to the filling in the shuttle, and adapted to engage said terminals and complete the circuit when the filling has become nearly exhausted.

7. In a loom, a shuttle adapted to carry a supply of filling and provided with circuit-closing means situated exterior to the filling in the shuttle, an electric circuit including an electromagnet and having yielding terminals situated exterior to the shuttle to engage said circuit-closing means and complete the circuit when the filling has become nearly exhausted.

8. In a loom, filling-replenishing mechanism, and means to control the time of operation of said mechanism, said means comprising an electric circuit, a shuttle adapted to contain a supply of filling and having an exposed circuit-closer, filling-induced movement of the terminals of said circuit preventing change of circuit through the circuit-closer until the filling has become exhausted to a predetermined extent, whereupon the circuit-closer carried by the shuttle acts upon the terminals to change the circuit and induce operation of the replenishing mechanism.

9. In a loom, filling-replenishing mechanism, an electric circuit containing an electromagnet and having terminals exterior to the shuttle, a shuttle provided with circuit-closing means exterior to the filling in the shuttle, a feeler to feel for the filling in the shuttle, said terminals being movable with said feeler to prevent closing the circuit when a sufficient or working supply of filling is present in the shuttle, and to close said circuit when the filling has become exhausted to a predetermined extent.

10. In a loom, filling-replenishing mechanism, an electric circuit having terminals exterior of the shuttle, a shuttle provided with an exposed metallic plate, a feeler arranged to be struck by the filling on the filling-carrier and controlling said terminals of the electric circuit to prevent contact of said terminals with the metallic plate until the filling has been exhausted to a predetermined point, after which to permit the terminals to meet said plate and complete the circuit, and means set in motion by closing said circuit to actuate said filling-replenishing mechanism to supply fresh filling.

11. A feeler, and an electric circuit having terminals, a key having a shuttle-bar provided with a shuttle having a hole in one side and with a metallic plate, and a filling-carrier in said shuttle, the end of said feeler being free to be struck and moved by the filling until the latter has become exhausted to a predetermined point when said terminals meet said metallic plate and close the circuit, filling-changing means, and device in said circuit and actuated after closing said circuit to move said filling-changing means and supply fresh filling.

12. A shiftable feeler having connected with it near its inner end the terminals of an electric circuit, a key having a shuttle-bar provided with a shuttle having a hole in one side and with a metallic plate, and a filling-carrier in said shuttle, the end of said feeler being free to be struck and moved by the filling until the latter has become exhausted to a predetermined point when said terminals meet said metallic plate and close the

circuit, filling-changing means, and device in said circuit and actuated after closing said circuit to move said filling-changing means and supply fresh filling.

13. A key having a shuttle-box, a shuttle having a connected metallic body and containing a filling-carrier, a movable feeler, means to operate said feeler that it may be moved forwardly with the key while the filling-carrier contains filling of the minimum quantity desired, an electric circuit the terminals of which are controlled by said feeler, said terminals contacting with the metallic body of the shuttle after the filling has been exhausted from the filling-carrier to a predetermined point, filling-changing means, and means act in motion by closing said circuit to operate said filling-changing means.

697,685. AUTOMATIC-DUMPING ORE-CAR. CHARLES E. SNOW.
San Francisco, Cal. Filed Jan. 12, 1901. Serial No. 89,447. (No model.)

Claim.—1. The combination with a car-body having a hinged swinging gate or door and a truck upon which the body is slidably mounted, of a fulcrumed latch and lever adapted to hold the door in a closed position, a fixed yoke having transverse upon the end about which the car-body supports are turnable, and a rod connecting the curved portion of the yoke with the latch of the door.

2. A wheeled truck, an arched yoke carried thereby having transverse at the ends, a car-body having supports journaled and turnable upon said transverse, a hinged door by which the end of the car-body is closed by gravitation, a fulcrumed latch engaging the lower edge of the door when closed, said latch having a lever-arm and a rod connecting said lever-arm with the upwardly-curved portion of the transverse-chest.

3. A wheeled truck having the two members of a turn-table carried thereon, the upper member having upturned sides, transverse projecting from the sides, a car-body having supports extending downwardly from the bottom and turnable upon said transverse, an upwardly-curved central portion of the transverse-chest having one end of a rod turnably connected therewith, a hinged automatically-closing door at the end of the car-body, a pivoted latch adapted to engage the bottom of the door and having a downwardly-projecting arm and connection between said arm and the opposite end of the rod whereby the tilting of the car unlatches the door.

4. The combination with a wheeled truck and a car-body slidably mounted thereon, and a turn-table upon the upper member of which the car-body is mounted, of an upwardly-curved or arched bar made substantially rectangular near the ends so that it may be immovably secured upon the turn-table, the ends of said arched bar provided with transverse, and a yoke on the car-body and engaging and turnable about said transverse.

5. A car-body having an inclined open end, a door hinged at the top and closable by gravitation, a centrally-pivoted latch adapted to engage the bottom of the door and having a downwardly-projecting arm, a truck having a transverse-support about which the car is tiltable, a fixed pin or shaft located above the line of the transverse and a rod connecting said shaft with the lever-arm of the latch.

6. A wheeled truck having an upwardly-inclined rear end with side flanges leveled or inclined to form a transverse V-shaped depression, a tiltable car-body having an extension below its rear end fitting said depression and having a slot made centrally therein, an upturned horizontally-moving latch adapted to engage the slot, a spring-pressed angle-lever carried upon the truck, to which the opposite end of the latch-bar is pivoted and a flat-lever projecting beneath the latch and adapted to disengage the latch when the car is to be dumped.

697,686. PORTLAND CEMENT. EDWARD F. BROWN, JR. Louisville, Mo.
Filed June 22, 1901. Serial No. 65,612. (No model.)

Claim.—1. In a crane, the combination of a horizontally-mounted support, a carrier telescopingly positioned within said support, hoisting means mounted on said carrier, and means for moving said carrier telescopingly within said support, substantially as and for the purpose set forth.

2. In a crane, the combination of a horizontally-mounted support, a carrier telescopingly positioned within said support, hoisting means mounted on said carrier, means for moving said carrier telescopingly within said support, and means mounted on said support adapted to prevent the tilting of said carrier when its forward end is projected beyond the forward end of the support, substantially as and for the purpose set forth.

3. In a crane, the combination of a reciprocating carrier, means for supporting said carrier, a hoist-cylinder mounted on said carrier, a lift piston and rod arranged to operate in said cylinder, a reciprocating pusher-cylinder fixed to said carrier and adapted to impart movement to the carrier, and a fixed piston and piston-rod on which said pusher-cylinder travels, substantially as described.

4. In a crane, the combination of a reciprocating carrier, means for supporting said carrier, a hoist-cylinder mounted on said carrier, a lift piston and rod arranged to operate in said hoist-cylinder, a reciprocating pusher-cylinder fixed to said carrier and adapted to travel therewith, a piston in said pusher-cylinder, and a piston-rod by which said last-named piston is connected to said carrier-support, substantially as described.

5. In a crane, the combination of a pair of rotatably-mounted beams, a pair of carriers reciprocally mounted between said beams, a pusher-cylinder fixed to said carriers and adapted to move therewith, a piston in said pusher-cylinder, a piston-rod having a fixed connection to said beams and to which said piston is connected, a hoisting-cylinder fixed to said carriers and arranged to move therewith, a piston in said hoist-cylinder, and a lifting piston-rod carried by said last-named piston, substantially as described.

6. In a crane, the combination of a reciprocating carrier, a support for said carrier, supporting-rollers on which said carrier is mounted, means for reciprocating said carrier, hoisting means mounted on said carrier, a guide-roller on said carrier and guides mounted on said carrier, supporting means adapted to receive said guide-roller, substantially as described.

7. In a crane, the combination with means for providing pressure medium, of valve-housings adapted to receive pressure medium, valves in said housings, pipes leading from said valve-housings, a carrier-support, a reciprocating carrier mounted on said support, a pusher-cylinder attached to said carrier and to which a portion of said pipes lead, and a hoist-cylinder to which the remainder of said pipes lead, substantially as described.

697,687. UNIVERSAL STANDARD. JAMES H. BRADLEY, Norwalk, Conn. Filed Mar. 14, 1901. Serial No. 61,188. (No model.)

Claim.—1. In an universal support, a standard provided with a terminal end having a lateral shoulder and rounded on the side opposite the shoulder, said shoulder being arranged within the vertical plane of the standard, in combination with a rigidly-mounted bracket provided with a

round opening of approximately the same size as the stud, and a compressible washer surrounding the stud above the shoulder, and between the end of the standard and the keeper.

2. In an umbrella-support, a standard having a terminal stud rounded on one side and provided at the opposite side with a lateral shoulder, which is arranged within the vertical plane of the standard, said stud being smaller in diameter than the standard so as to provide a shoulder at its junction therewith, in combination with an elevated, hollow cylindrical keeper having a base-attaching flange and provided with a round opening of approximately the same size as the stud, the stud being adapted to pass through the opening and its shoulder engage the inner wall of the keeper.

3. In an umbrella-support, a horizontal bar provided with a cylindrical socket at one end, said socket having a rounded bottom and open at the top and recessed at one point of its side to provide engaging corner, a canopy-staff provided with a cylindrical thimble at its lower end, the bottom of the thimble being rounded to fit the bottom of the socket, and a nut-screw passing through the side of the socket and engaging said thimble opposite the engaging corner of the socket.

4. In an umbrella-support, the bar provided with a socket, in combination with a canopy-staff removably fitted in said socket, a runner on said staff, and interlocking means between said runner and said bar to prevent rotation of the runner.

5. In an umbrella-support, a standard, and a horizontal bar adjustable thereon and provided with a socket, in combination with a canopy-staff, removably fitted in said socket, a runner on said staff provided with a notch, and a lug on the horizontal bar adapted to enter said notch to form an interlocked engagement between the horizontal bar and runner.

6. In an umbrella-support, a standard, a horizontal bar adjustably mounted thereon and provided with a socket, a canopy-staff provided with a terminal thimble fitted in said socket, a runner mounted on the staff, and interlocking means on the horizontal bar and runner for preventing rotation of said runner.

697,688. DEVULGARISING APPARATUS. LOUIS A. SYRMAN, Akron, Ohio. Filed Jan. 12, 1902. Serial No. 22,522. (No model.)

Claim.—1. An improved devulgarising apparatus consisting of a shoulder hollow cone, and an outer concentric cone, with an opening to introduce material into said hollow cone, and a cover to close it, said cone being journaled to revolve on a central axis, and means for revolving them, a paddle-wheel mounted inside of and concentric with

said inner cone, and means for driving it in a direction opposite to that of said cone, means for introducing live steam between said cones, and an exhaust to permit its escape therefrom, substantially as shown and described.

2. An improved devulgariser consisting of a double hollow cone having its diameter greater than its length to cause the contents to accumulate in a clear mass by gravitation, a concentric insulating cone separated therefrom to leave a steam-space, means for introducing live steam into said space and permitting its escape therefrom, common journals to revolvably support said cones, means for revolving said cones; a paddle-wheel concentrically mounted in said inner cone and means for revolving it independently of said cone, substantially as shown and described.

697,689. DOOR AND FRAME FOR AIR-TIGHT CHAMBERS. E. P. SCHWENK, Chester, Pa. Filed Sept. 14, 1900. Renewed July 12, 1901. Serial No. 62,522. (No model.)

Claim.—1. A door for air-tight compartments consisting of rigid stiles united by rails susceptible of torsion, a flexible inner sheathing, a flexible outer sheathing having a rim projecting beyond the stiles and rails, and a compressible gasket secured to said projecting rim, in combination with elastic hinges and a latch so proportioned as to exert equal pressure upon the gasket in all parts between the rim of the door and a casing surrounding the door-opening as set forth.

2. A combined frame and casing for the door-openings of refrigerating-chambers, consisting of stiles and rails rigid in the direction of their breadth and length, and susceptible of torsional flexure, in combination with a front casing secured thereto, adapted to contact with the gasket of the door opposed thereto, the whole arranged and adapted to be adjustably applied thereto, substantially as set forth.

3. In a door for air-tight compartments, rigid stiles united by rails susceptible of torsion, and a flexible inner sheathing attached to said frame, in combination with a flexible outer sheathing, also secured to said stiles and rails, and provided with a rim projecting beyond the stiles and rails, adapted to overlap and by flexure apply closely to the casing of the door-opening substantially as set forth.

4. In a frame for doors of air-tight compartments, stiles and a head and a sill rigid in longitudinal direction, and torsionally flexible, in combination with a torsionally-flexible casing attached to the front of said frame, and adapted to be adjusted by torsion to fit the deviations from a flat plane of a door applied thereto, substantially as set forth.

5. In a combined air-tight door and frame for refrigerating and like chambers, a door having rigid stiles, rails connecting with said stiles, susceptible of torsional flexure, an inner sheathing susceptible of torsional flexure, an outer sheathing projecting beyond the stiles and rails, also torsionally flexible, and a frame having all parts rigid in the direction of their depth, a casing secured to said frame, a gasket applied to said outer sheathing to contact with said casing, in combination with elastic hinges and a latch, proportioned and arranged to press said door upon said gasket uniformly in all parts against said casing, with continuous pressure, as and for the purpose set forth.

6. Doors having rigid edges and torsionally-flexible flaps in combination with elastic hinges and fastenings, arranged and adapted to apply the edges to contact with casings liable to variably deviate from flat planes, as and for the purpose set forth.

7. A door in combination with hinges, and fastenings, arranged to convert the momentum of the door in closing into a constant elastic force, to maintain pressure upon a gasket applied between the door and the margin of the door-opening as set forth.

8. In a door for air-tight inclosures, a doorway-frame, a flexible door fitted to overlap the front margin of said frame, elastic hinges applied to edge of said door, an automatic fastening, applied to the opposite edge of the door, and arranged to elastically enforce contact between the margin of the frame and the margin of the door, substantially as set forth.

9. In a door for air-tight apartments, a torsionally-flexible frame formed of rigid stiles and rails, an inner and outer torsionally flexible sheathing secured thereto, said outer sheathing projecting as a rim be-

yond the frame and provided with a compressible gasket adapted to contact closely with the casing of a door-frame, substantially as set forth.

10. In a door and frame for air-tight apartments, a door frame and casing, having rigid edges and torsionally-flexible casing, in combination with a door having an edge-wise-rigid frame and torsionally-flexible flaps, one of which flaps overlaps the flaps of the casing, and a gasket applied to said overlapping flaps, substantially as set forth.

11. A door having an edge-wise-rigid frame and flexible flaps, one of which flaps projects beyond the frame, in combination with a gasket applied to said projecting flaps, and elastic hinges attached to said door, adapted to elastically enforce the door with a door-frame, substantially as set forth.

12. A door having an edge-wise-rigid frame and flexible flaps, one of which flaps projects beyond the frame, and a gasket applied to said projecting flaps, in combination with a locking-latch adapted to automatically engage a keeper and hold the gasket under compression against a door-frame casing, substantially as set forth.

13. In a frame for doors of air-tight inclosures embracing torsionally-flexible joints and a head rigid in longitudinal direction, adapted to be adjustably applied to an opening in a wall and a casing attached to the front of said frame, adapted to support the bearings of extended hinges from said casing as shown and described.

14. In a frame for doors of air-tight apartments embracing a head a sill and torsionally-flexible joints and a head fixed casing adapted to support extended hinges arranged to swing the door clear of the line of the doorway-opening when opened at right angles as set forth.

697,690. BURNER. THOMAS SYRMAN, Gloucester City, N. J., assignor to Weibach Light Company, Gloucester City, N. J., a Corporation of New Jersey. Filed Sept. 22, 1901. Serial No. 74,522. (No model.)

Claim.—1. A burner provided with a gallery, a detachable chimney-guide provided with a base-ring adapted to the gallery, and locking devices between the gallery and base-ring, substantially as described.

2. A burner provided with a gallery having bottom, a globe-ring detachably fitted outside of the bottom, and a chimney-guide detachably fitted inside of the bottom, substantially as described.

3. A burner provided with a gallery having chimney-supports and having bottom, a removable globe-ring detachably fitted to said bottom, and a removable chimney-guide detachably fitted to said bottom, substantially as described.

4. A burner provided with a gallery, a removable chimney-guide consisting of top and bottom rings, and arms arranged between said rings with their ends projecting through the bottom ring and said projecting ends constructed and arranged to cooperate with openings in the gallery, substantially as described.

5. A burner comprising a gallery provided with arms radiating from the base-land and with openings in the arms arranged opposite said arms, each arm having an upwardly-projecting bifurcated chimney-support of which the legs join the arms intermediate of its length and having a tongue-like end on the arm that extends beyond and between the legs of the chimney-support and engages said openings, substantially as described.

6. A burner provided with two sets of concentric arms and having three coats, one coat between the sets of arms and a second coat inside of the inner set of arms and a third coat outside of the outer set of arms, substantially as described.

7. A burner provided with a gallery, a removable globe-ring and a removable chimney-guide, each constructed for engagement with and disengagement from said gallery and to be held thereby, substantially as described.

697,691. CUSHION-TIRE. WILLIAM E. DE JON, Brooklyn, N. Y. Filed Oct. 1, 1901. Serial No. 77,521. (No model.)

Claim.—As a new article of manufacture, a cushion-tire comprising a base adapted to fit the rim of a wheel, a relatively narrow tread, and cushions joining the said base and tread at intervals, the said cushions being narrower at the top and broadening laterally downward to the width of the base, the said tread, cushions and base being constructed in one piece, substantially as described.

697,692. RAY RAKER AND RAKER. JERAM E. STRAHM and ROBERT A. KIRKMAN, St. Paul, Minn. Filed Aug. 12, 1901. Serial No. 71,522. (No model.)

Claim.—1. In a combined ray raker and rake, the combination with the press-bar and hopper, of a horizontally-extending chute leading to the hopper, an elevating apparatus for raising and discharging to the chute, a plunger for the press-bar, a rotatable cam disposed for engagement with the plunger to move it forwardly, a pivoted lever, a feeder-plunger carried by the lever for movement to engage and feed hay into the bar in advance of the press-plunger, and having a depending ear and in the path of movement of the cam for engagement thereby to operate the lever and thence with the feeder-plunger, a pivoted lever having springs at

its ends connected with the lever and pressure-plunger, a ball-wheel, and connections between the ball-wheel and the cam and the elevating apparatus.

2. In a baler, the combination with a press-bar and its hopper, of a feeding device for the hopper, a plunger for the press-bar, a pivoted lever having springs connected with its ends and with the feeding device and plunger respectively, and means for engagement with the feeding device and plunger alternately to operate them and place the springs under tension to retract the inspiratory member.

3. In a baler, the combination with the press-bar and plunger of a rotatable cam disposed for engagement with the plunger to give it forwardly, a pivoted lever, a feeder-plunger carried by the lever for movement to engage and feed hay into the box in advance of the pressure-plunger, a link pivoted to the opposite end of the lever in the path of movement of the cam for operating the lever and through the feeder-plunger, and a pivoted lever having springs at its ends connected with the lever and pressure-plunger, for the purpose set forth.

697,698. ROTARY ENGINE. JAMES THOMSON, Patent No. 1,111, Filed May 24, 1901. Serial No. 61,707. (No model.)

Claim.—1. In combination, a stationary support, a driving-wheel and a rotary engine comprising a stationary member mounted on the support and a rotary member adjustably connected to the spokes of the wheel for adjusting the rotary member with respect to the said spokes, substantially as set forth.

2. In combination, a stationary support, a driving-wheel and a rotary engine comprising a stationary member yieldingly mounted on the support and a rotary member mounted to the spokes of the wheel, substantially as set forth.

3. In combination, a stationary support, a driving-wheel and a rotary engine comprising a stationary member yieldingly mounted on the support and a rotary member adjustably connected to the spokes of the wheel for adjusting the rotary member with respect to the said spokes, substantially as set forth.

4. In combination, a stationary support, a driving-wheel, a rotary engine comprising a stationary member mounted on the support and a rotary member and clips for securing the rotary member to the driving-wheel, substantially as set forth.

5. A rotary engine comprising a stationary member having an annular piston-chamber, stationary chambers in the chamber, a rotary member, ball-pistons carried thereby and fitted to travel along within the said piston-chamber and over the chambers, means for controlling the inward and outward movements of the ball-pistons and means for controlling the admission and escape of the motive fluid to and from the piston-chamber, substantially as set forth.

6. A rotary engine comprising a stationary member having an annular piston-chamber in its periphery, motive-fluid inlet and outlet ports, stationary chambers located between each pair of inlet and outlet ports, a rotary member, and spring-actuated ball-pistons fitted to travel along within said piston-chamber and over the chambers and means for controlling the admission and escape of the motive fluid to and from the piston-chamber, substantially as set forth.

7. A rotary engine comprising a stationary member having an annular piston-chamber in its periphery and two inner, annular chambers,

alternating inlet and outlet conduits connecting the inner annular chambers with the piston-chamber, valves for opening and closing the conduits, stationary chambers between the two conduits of each alternating pair, a rotary member, spring-actuated ball-pistons carried thereby and fitted to travel along within the said piston-chamber and over the chambers and means carried by the rotary member for controlling the operation of the valves in the conduits in the stationary member, substantially as set forth.

8. A rotary engine comprising a stationary member having an annular piston-chamber with chambers therein, motive-fluid inlet and outlet conduits arranged in pairs, valves therefor, an annular series of valve-operating plates for operating the inlet-valves and a second series of valve-operating plates for operating the outlet-valves, a rotary member, ball-pistons carried thereby and fitted to travel along within said piston-chamber and over the chambers and rollers carried by the rotary member in position to successively engage the two annular series of valve-operating plates for opening the valves at predetermined intervals, substantially as set forth.

9. In a rotary engine, a stationary member, a piston-chamber therein, a motive-fluid conduit leading to the piston-chamber, a valve for opening and closing said conduit, a valve-operating plate pivoted to the stationary member, and connected with the valve-stem, a rotary member, a piston carried thereby and a roller carried by the rotary member in position to force the plate inwardly to open the valve, substantially as set forth.

10. In a rotary engine, a stationary member having a piston-chamber therein, a motive-fluid conduit communicating with the piston-chamber, a valve for opening and closing said conduit, a valve-operating plate secured on the stationary member and connected to the valve-stem, a movable cam-plate for adjusting the valve-operating plate, a rotary member, a piston carried thereby and a roller carried by the rotary member in position to depress the valve-operating plate for opening the valve, substantially as set forth.

11. In a rotary engine, a stationary member having an annular piston-chamber therein, fluid inlet and outlet conduits communicating with the piston-chamber, valves for opening and closing the said conduits, a series of valve-operating plates upon each face of the engine for operating the inlet and outlet valves, respectively, the said plates being secured on the stationary member, a cam-plate having a limited rotary movement in opposite directions for adjusting the two series of cam-plates for controlling the length of time that the valves shall remain open, a rotary member, pistons carried thereby and rollers carried by the rotary member in position to engage the two series of valve-operating plates for successively operating the valves, substantially as set forth.

12. In a rotary engine, a stationary member having an annular piston-chamber therein, a rotary member having spring-actuated ball-pistons fitted to travel along within said piston-chamber and a stationary cam-plate connected with the ball-pistons for controlling the inward and outward movement of the same, substantially as set forth.

13. In a rotary engine, a rotary member, a ball-piston, a casing, a spring-actuated follower within the casing and hinged outlet-pieces interposed between the ball-piston and the follower and hinged to the follower, substantially as set forth.

14. In combination, a valve, a valve-operating plate connected with the valve-stem and having an elongated groove therein, a support having a stationary fulcrum within the said groove, a yoke having an elongated groove embracing the fulcrum and a transverse groove therein, a loose stud located in the said transverse groove and the elongated groove in the plate and means for raising and lowering the yoke for adjusting the position of the loose pin with respect to the fulcrum for adjusting the movement of the plate, substantially as set forth.

15. In combination, two valves, a valve-operating plate for each valve connected thereto and having an elongated slot therein, stationary fulcrums for each plate located in the said elongated groove, a yoke for each plate having an elongated groove embracing the fulcrum and a transverse groove therein, a loose stud located in the said transverse groove and the elongated groove in the plate, a rotary cam-plate having an irregular cam-slot therein comprising a concave central portion and two outwardly-extended wing portions, the said yokes being provided with studs engaging said slot, whereby, when the cam-plate is moved in one direction or the other, the movement of the one or the other of the valve-operating plates is adjusted, substantially as set forth.

16. A rotary engine comprising a circular stationary member, a rotary ring-shaped member mounted on the periphery of the stationary member and confining liquid carried to the movable member and overlapping the opposite face of the stationary member for holding the rotary member in position thereon, substantially as set forth.

17. A rotary engine comprising a circular stationary member having an annular peripheral piston-chamber therein, a rotary member mounted on the periphery of the stationary member, ball-pistons carried by the rotary member and fitted to travel along the said piston-chamber, pack-

ing-rings, triangular in cross-section, located along the periphery of the stationary section upon the opposite sides of the piston-chamber and spring-actuated adjustable follower-rings for forcing the packing-rings snugly against the face of the rotary member and against the walls of the ball-pistons for taking up wear, substantially as set forth.

18. In combination, a wheel, a rotary engine comprising a stationary member and a rotary member, and means for adjustably connecting the rotary member with the spokes of the wheel comprising a plurality of split clips embracing the spokes and having laterally-extended rectangular plates and open-ended recesses on the periphery of the rotary member having convex sides which recesses are adapted to receive the clip-plates and bolts for securing the centers of the clip-plates to the rotary member, substantially as set forth.

19. In combination, a stationary support, a rotary engine and means for yieldingly mounting the engine on the support comprising a box embracing three sides of the support and a spring-actuated bearing-plate interposed between the engine and the other side of the support, substantially as set forth.

20. In combination, a stationary support, a rotary engine comprising a stationary member and a rotary member mounted thereon and means for yieldingly mounting the stationary member on the support comprising a box embracing three sides of the support, a spring-actuated follower-plate interposed between the other side of the support and the stationary member and means for adjusting the spring tension thereof, substantially as set forth.

697,694. PRESSURE-RETAINING VALVES FOR AIR-BRAKES. JOHN A. TOLL, Chas. H. Hunt, assignors of one-half to Peter Henry, Chas. Hunt. Filed Nov. 20, 1901. Serial No. 60,000. (No model.)

Claim.—1. The combination with an air-brake system, of a pipe connected to the exhaust-port of the triple valve; a duplex valve embracing two valves requiring different pressures to operate the same; and a plug adapted to place the pipe in communication with the said valves alternately.

2. The combination with an air-brake system, of a pipe connected to the exhaust-port of the triple valve; a duplex valve embracing two valves requiring different pressures to operate the same; and a plug adapted to place the pipe in communication with the said valves alternately.

3. The combination with an air-brake system, of a pipe connected to the exhaust-port of the triple valve; a duplex valve embracing a plurality of valves of unequal power; a plug adapted to place the pipe in communication with the valves; and means for opening a passage from the pipe to the atmosphere.

4. The combination with an air-brake system, of a pipe connected to the exhaust-port of the triple valve; a duplex valve embracing a plurality of valves held to their seats with unequal pressures; a plug with passages adapted to open communication between the pipe and the valves; and means in connection with the plug for opening a passage to the atmosphere.

697,695. CURTAIN-STRETCHER. FRANCIS VALENTI, Milwaukee, Wis. Filed July 12, 1901. Serial No. 60,500. (No model.)

Claim.—1. In a curtain-stretcher, the combination with a sectional frame; of means for locking the sections together; a central sectional roller on the frame; stationary engaging hooks carried by the sections of the frame; a slide-bar arranged upon said sections; engaging hooks carried by said slide-bar; shafts journaled on the slide-bar; a flexible strip connected to the slide-bar and central roller and passing over the

rollers of the frame whereby movement of the slide is effected; and means for effecting longitudinal stretching of the curtain.

2. In a curtain-stretcher, the combination with a sectional frame provided with means for engaging a curtain; of a sectional slide-bar carried by said frame and provided with means for engaging the curtain, a central longitudinal sectional shaft, means connecting the slide and roller whereby transverse stretching of the curtain is effected; shafts carried by said sections and arranged transversely thereof; and straps carried by said shaft for engaging the curtain to effect longitudinal stretching thereof.

3. In a curtain-stretcher, the combination with a sectional frame provided with means for engaging a curtain; of a sectional slide-bar carried thereby and also provided with means for engaging the curtain; shafts extending longitudinally of said sections; connections between said shafts and the slide-bar for operating the latter; and means for coupling said shafts together for simultaneously operating the same.

4. In a curtain-stretcher, the combination with a sectional frame provided with means for engaging the curtain; of a sectional slide-bar carried thereby and also provided with means for engaging the curtain; shafts arranged upon said sections and extending longitudinally thereof; a coupling-shaft carried by one of said shafts and adapted to receive the other whereby said shafts are simultaneously operated; suitable connections between the slide-bar and said shafts for operating the former; and transversely-arranged shafts carried by the sections and provided with means for engaging the curtain to effect longitudinal stretching thereof.

5. In a curtain-stretcher, the combination with a sectional frame provided with means for engaging a curtain; of a slide-bar carried by said frame; and also provided with means for engaging the curtain; means for locking the sections of the frame together; shafts carried by said sections and extending longitudinally thereof; means for coupling said shafts together to effect simultaneous operation of the same; transversely-arranged shafts also carried by the sections; and straps carried by said shafts and provided with means for engaging the curtain to effect longitudinal stretching thereof.

697,696. MACHINE FOR MAKING KICK-BOARD. HENRY F. WATSON, Valparaiso, Ind., assignor of one-half to Milton A. Gilder, Valparaiso, Ind. Filed Feb. 15, 1901. Serial No. 67,067. (No model.)

Claim.—1. A machine for making kick-board, or the like, comprising a movable support, means to impart movement thereto, a hopper above said support, a feed mechanism adapted to deliver the contents of said hopper upon said support, a roll revolvably mounted above said support to deliver the contents of said hopper upon said movable support, and a feed mechanism adapted to deliver the contents of said hopper upon said movable support, substantially as described.

2. A machine for making kick-board, or the like, comprising a movable support, means to impart movement to said support, pivoted arms, a hopper supported thereon, means to adjust the free ends of said arms toward and from said movable support, and a feed mechanism adapted to deliver the contents of said hopper upon said movable support, substantially as described.

3. A machine for making kick-board, or the like, comprising a movable support, means to impart movement to said support, pivoted arms, a hopper supported thereon, means to adjust the free ends of said arms toward and from said movable support, and a feed mechanism adapted to deliver the contents of said hopper upon said movable support, substantially as described.

hopper supported upon said arm, a roll revolvably mounted in said arm at the discharge side of said hopper, means to adjust the free ends of said arm toward and from said movable support and a feed mechanism adapted to deliver the contents of said hopper upon said movable support, substantially as described.

4. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of said opening, and means to impart reciprocating movement to said plate, substantially as described.

5. A machine for making min-board, or the like, comprising a movable support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of said opening, the hopper-wall on the discharge side thereof being thin at its lower edge, and means to impart reciprocating movement to said plate, substantially as described.

6. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of the opening in said hopper in such position that it declines toward the discharge side thereof, and means to impart reciprocating movement to said plate, substantially as described.

7. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of said opening, a plate supported beneath said figured plate and means to impart reciprocating movement to both of said plates, substantially as described.

8. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of the opening in said hopper, the means for supporting said figured plate comprising a rod fitted to and longitudinally movable in suitable bearings in brackets secured to said hopper and means applied to said rod to impart reciprocating movement to said figured plate, substantially as described.

9. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of said hopper-opening, the means for supporting said figured plate comprising a rod fitted to and longitudinally movable in brackets on said hopper, and means to impart reciprocating movement to said plate, said means comprising a cam-wheel and a pivoted bell-crank, one arm of which is connected to said plate-supporting rod and the other arm of which projects into the path of travel of said cam-wheel, substantially as described.

10. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of said hopper-opening, the

means for supporting said figured plate comprising a rod fitted to and longitudinally movable in brackets on said hopper and means to impart reciprocating movement to said plate, said means comprising a pivoted bell-crank, one arm of which is connected to the rod on which said figured plate is supported and the other end of which projects into the path of travel of a cam-wheel, means to rotate said cam-wheel and a spring applied to said bell-crank adapted to move it in the opposite direction from said cam-wheel, substantially as described.

11. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of said hopper-opening, the means for supporting said figured plate comprising a rod fitted to and longitudinally movable in brackets on said hopper, and means to impart reciprocating movement to said figured plate, said means comprising a link adjustably connected to said figured plate, substantially as described.

12. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of said hopper-opening, the means for supporting said plate comprising a rod fitted to and longitudinally movable in brackets on said hopper and cross-arms on said rod to which said figured plate is attached, substantially as described.

13. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support provided with an opening in its under side, a figured plate supported in contact with the edges of said hopper-opening, a plate supported beneath said figured plate, the means for supporting said plate comprising a rod supported in brackets and cross-arms on said rod to which said plate is attached and means for imparting reciprocating movement to said plate, substantially as described.

14. A machine for making min-board, or the like, comprising a movable support, means to impart movement thereto, a hopper above said support provided with an opening in its under side, a plate supported in contact with the edges of said hopper-opening, fingers on said plate which extend beyond the wall of said hopper on the discharge side thereof and means to impart reciprocating movement to said plate, substantially as described.

15. A machine for making min-board, or the like, comprising a movable support, means to impart movement thereto, a hopper above said support provided with an opening in its under side, a plate supported in contact with the edges of said opening, fingers on said plate which extend beyond the wall of said hopper on the discharge side thereof, a plate beneath said figured plate and means to impart reciprocating movement to said plates, substantially as described.

16. A machine for making min-board, or the like, comprising a movable support, means to impart movement thereto, a plurality of hoppers above said support provided with openings in their under sides, figured plates supported in contact with the edges of the openings in said hoppers, plates beneath said figured plates and means to impart reciprocating movement to said plates, substantially as described.

17. A machine for making min-board, or the like, comprising a movable support, means to impart movement thereto, a hopper above said support, a retaining-roll revolvably mounted above said support at the rear of said hopper, said hopper being provided with an opening in its under side, a plate supported in contact with the edges of the opening in said hopper, fingers on said plate which extend beyond the wall of said hopper and into close proximity to the under side of said retaining-roll and means to impart reciprocating movement to said plate, substantially as described.

18. A machine for making min-board, or the like, comprising a movable support, means to impart movement thereto, a hopper above said support, a retaining-roll revolvably mounted above said support at the rear of said hopper, said hopper being provided with an opening in its under side, a plate supported in contact with the edges of the opening in said hopper, fingers on said plate which extend beyond the hopper-wall and into close proximity to the under side of said retaining-roll, a plate beneath said figured plate and means to impart reciprocating movement to said plates, substantially as described.

19. The combination with a hopper provided with an opening in its under side of means to feed the contents of said hopper therefrom, said means comprising a figured plate supported in contact with the edges of said hopper-opening, a plate supported beneath said figured plate and means to impart reciprocating movement to said plates, substantially as described.

20. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support, a feed mechanism adapted to deliver the contents of said hopper upon said support and means for applying a bonding agent to the material delivered upon said support, said means comprising a per-

forated cylinder the interior of which communicates with a source of supply, a casing which incloses said perforated cylinder provided with an opening in its under side and means to pack or close the space between said cylinder and casing at the edges of the opening in said casing, substantially as described.

21. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support, a feed mechanism adapted to deliver the contents of said hopper upon said support and means for applying a bonding agent to the material delivered upon said support, said means comprising a perforated cylinder the interior of which communicates with a suitable source of supply, a rotatable casing which incloses said perforated cylinder, said casing being provided with an opening adapted to be brought beneath or above said perforated cylinder by turning said casing and means to close or pack the space between said cylinder and casing at the edges of the opening in said casing, substantially as described.

22. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support, a feed mechanism adapted to deliver the contents of said hopper upon said support and means for applying a bonding agent to the material delivered from said hopper upon said support, said means comprising a rotatable perforated cylinder the interior of which communicates with a source of supply, a rotatable casing or jacket which incloses said perforated cylinder, said casing being provided with an opening adapted to be brought beneath or above said perforated cylinder by turning said casing, packings which close the space between said cylinder and casing at the edges of the opening in said casing and means to rotate said cylinder, substantially as described.

23. A machine for making min-board, or the like, comprising a movable support, means to impart movement to said support, a hopper above said support, a feed mechanism adapted to deliver the contents of said hopper upon said support and a bond-applying mechanism, comprising a rotatable perforated cylinder the interior of which communicates with a source of supply, means to rotate said cylinder, a rotatable casing which incloses said cylinder, said casing being provided with an opening which may be brought above or below said cylinder by turning said casing and packings which close the space between said cylinder and casing at the edges of the opening in said casing, comprising a strip of suitable material secured to said casing so that it will rub on the surface of said cylinder, substantially as described.

24. The combination of a rotatable perforated cylinder the interior of which communicates with a source of fluid-supply, means to rotate said cylinder and a rotatable casing which incloses said cylinder, said casing being provided with an opening adapted to be brought above or beneath said cylinder by turning said casing, substantially as described.

25. A machine for making min-board, or the like, comprising a movable support, means to impart movement thereto, a plurality of hoppers above said support provided with openings in their under sides, figured plates supported in contact with the edges of the openings in said hoppers and means to impart reciprocating movement to said plates, substantially as described.

26. A machine for making min-board, or the like, comprising a movable support, means to impart movement thereto, a plurality of hoppers above said support disposed at intervals along the same, means to feed the contents of said hoppers upon said movable support and means located at the delivery side of said hoppers for applying a bonding agent to the material delivered upon said support from said hoppers, substantially as described.

697,697. FAN. JAMES J. WOOD, Fort Wayne, Ind. Original application filed Feb. 28, 1891, Serial No. 61,046. Revised and this application filed June 16, 1900. Serial No. 61,061. (No model.)

Claim.—1. The combination with a support mounted to rotate on its axis, of means for rotating said support consisting of a fan mounted on said support on a shaft oblique to said axis, the said fan being substantially unbalanced and the obliquity of said fan-shaft alone causing the rotation of said support.

2. The combination with a support mounted to rotate on its axis, of means for rotating said support consisting of a fan mounted on said support on a shaft oblique to said axis, the said fan being substantially unbalanced and the obliquity of said fan-shaft alone causing the rotation of said support.

3. The combination with a support mounted to rotate on its axis, of a fan mounted on said support on a shaft oblique to said axis, means for rotating said fan whereby said support is rotated on its axis, and means for controlling the speed of rotation of said support on its axis.

4. The combination with a support mounted to rotate on its axis, of a fan mounted on said support on a shaft oblique to said axis, means for rotating said fan whereby said support is rotated on its axis, and a brake for retarding the rotation of said support on its axis.

5. The combination with a support mounted to rotate on its axis, of a fan mounted on said support on a shaft oblique to said axis, means for rotating said fan whereby said support is rotated on its axis, a brake for retarding the rotation of said support, and means for adjusting said brake so as to control the speed of rotation of said support on its axis.

6. The combination with a rotary motor-casing, of a stationary casing supporting it, said stationary casing being composed of a shell E carrying the rotary casing, and a shell F carrying a brake adapted to bear upon the rotary casing, and means for giving said shells a movement toward or away from each other so as to adjust the pressure of said brake on said rotary casing.

697,698. MAGNETO-BELL RINGER. BRUNN E. YALLEN, Chicago, Ill. Filed Dec. 4, 1891. Serial No. 61,061. (No model.)

Claim.—In a magneto-bell ringer, the combination of electromagnets having cores presenting projecting, rounded and portion, an armature-support comprising a yoke having openings to receive said cores, and adjustable nuts on each of the threaded and portions of the cores clamping the yoke between them, substantially as and for the purpose set forth.

697,699. STEERING-LOCK FOR VEHICLES. GEORGE P. ADAMS, Boston, Mass., assignor of one-half to R. J. FINE, Boston, Mass. Filed Sept. 11, 1891. Serial No. 61,061. (No model.)

Claim.—1. In a locking device, a fixed locking member having two opposed locking-curbs, a rotary member to be moved, a pair of automatic clutches located on the same side of the rotary axis of said rotary member and acting simultaneously in opposite radial directions on the respective locking-curbs to lock said axis to the fixed locking member, and a rotary actuator to release the clutches and rotate the rotary member.

2. In a locking device, a fixed locking-segment having two opposed locking-surfaces, an oscillatory arm to be moved, two pairs of automatic clutches located on the same side of the rotary axis of said arm, the pairs locking alternatively in opposite angular directions, the two clutches of a pair acting simultaneously in opposite radial directions on the respective locking-surfaces to lock said arm to the segment, and an oscillatory actuator acting in opposite angular directions to release the clutches and oscillate the arm.

697,700. OILER. ARTHUR H. ALDER, Westport, N. H. Filed Dec. 18, 1901. Serial No. 88,471. (No model.)

Claim.—1. An oiler, comprising a can, a cylinder adapted to be secured in said can, a ball-valve secured in the lower end of the cylinder, a piston-head provided with a vertical opening adapted to operate in the cylinder above the ball-valve, a pipe secured to the upper end of the piston-head and passing through a collar on the upper end of the cylinder, and adapted to receive a T-joint provided with a pin-valve, substantially as described.

2. An oiler comprising a can, a cylinder adapted to be secured in said can, a ball-valve secured in the lower end of the cylinder, a piston-head provided with a vertical opening adapted to operate in the cylinder, a pipe the lower end of which is secured to the piston-head, and the upper end terminating at right angles and secured to a T-joint, a valve-seat portion provided with a vertical opening secured to the lower end of the T-joint, and having a valve-seat in the upper end thereof, a pin-valve the stem portion of which is provided with a series of grooves, and the upper portion terminating in a pin projection, a screw-threaded plug provided with a lug projection secured in the top of the T-joint, a spiral spring around the pin projection and plug projection normally holding the valve in the valve-seat, substantially as described.

697,701. MACHINIST'S SCALE. ALBERT E. AYER, East Boston, Mass., assignor of one-half to Herbert B. Newton, Haverhill, Mass. Filed Feb. 21, 1901. Serial No. 88,665. (No model.)

Claim.—1. A machinist's scale having a longitudinal straight edge which is provided with a regular series of standard graduations, a series

of steps arranged along the opposite longitudinal edge, each step consisting of two edge sections, one of which is parallel to one end of the scale and perpendicular to the graduated edge, and to the other edge section, each of the latter edge sections being of a length expressed in standard units by a recognized coefficient suitably indicated by markings on the scale.

2. A scale having a regular series of graduations along one edge, the opposite edge of the scale being provided with a series of steps or shoulders which are different standard distances apart, the sections of the edge between each shoulder being parallel to the edge on which the graduations are formed, and the distances between each shoulder and one end of the scale being indicated by the graduations to which they correspond at appropriate points.

3. A machinist's scale having a series of steps arranged along the entire length of one longitudinal edge, each step consisting of two edge sections, one of which is parallel to the widest end of the scale and perpendicular to the other edge section, each of the latter edge sections being of a length different from the others, and expressed in standard units by a recognized coefficient suitably indicated by markings on the scale.

697,702. PRESSURE-REGULATOR. THOMAS J. DOWLEY and FREDERICK R. PLANK, Chicago, Ill. Filed Apr. 20, 1901. Serial No. 88,217. (No model.)

Claim.—1. In a pressure-regulator, the combination of the shell provided with a channel in its upper surface, a passage leading into it from the discharge side of the pump, and a cylindrical partition with a diaphragm for controlling the opening in said partition, and also provided with openings registering with said channel whereby the reduced pressure controls from the top the movement of the diaphragm, substantially as described.

2. In a pressure-regulator, the combination with the shell and cap for the same provided with adjoining channels separated by a diaphragm, said diaphragm being perforated between the channels, one side of the channel in the cap being also perforated, a passage leading from the discharge side of the casing into said channels, and means for admitting fluid under the diaphragm substantially as described.

3. In a pressure-regulator, the combination of a casing provided with an inlet and outlet ports, a channel in the upper surface, a passage leading from the outlet into the same with a diaphragm, an opening in the shell controlled by the diaphragm, openings in the diaphragm opposite the channels, and a regulating spring on the back of the diaphragm, substantially as described.

4. In a pressure-regulator, the combination of a casing provided with a channel on its upper surface with a cap having a channel in its upper surface, a diaphragm held between the two surfaces formed by the channels, perforations in said diaphragm between the channels and a passage leading from the discharge side of the regulator through the channels to the back of the diaphragm, substantially as described.

697,703. SHELL. WHELAN & GALLAGHER, Mountbush, Maine. Filed May 1, 1901. Serial No. 88,330. (No model.)

Claim.—A projectile having a breach-opening threaded at its inner end and enlarged at its outer end and adapted to receive an explosive and having other openings in communication with the breach-opening and adapted to receive cartridges, and a hollow breach headed at its outer

end and threaded at its inner end and having an opening in its side, the headed end serving to enter the enlarged outer end of the breach-opening and close the same, substantially as set forth.

697,704. HYDRAULIC BREEDER, ELEVATOR, AND ELEVATOR. CURTIS L. CURTIS, New York, N. Y. Filed June 4, 1901. Serial No. 88,308. (No model.)

Claim.—1. A dredger, excavator and elevator comprising a stand-pipe having an inlet and outlet for the material and a waste-chest secured to the stand-pipe and spaced from the inlet, the said waste-chest having opposite projected nozzles arranged to direct jets into the material and into the stand-pipe for disintegrating the material, drawing it into the stand-pipe and elevating it, substantially as set forth.

2. A dredger, excavator and elevator comprising a stand-pipe having an inlet and an outlet, a waste-chest spaced from the inlet and having two chambers therein, a nozzle projected outwardly from one chamber for directing a jet into the material for disintegrating it and another nozzle projected inwardly from the other chamber for directing a jet into the stand-pipe for drawing in and elevating the disintegrated material, substantially as set forth.

3. A dredger, excavator and elevator comprising a stand-pipe having its bottom and top ends open to form an inlet and outlet respectively, a waste-chest spaced from the open inlet end of the pipe having an outwardly-projected nozzle and an inwardly-projected nozzle and hydraulic feed-pipes communicating with the waste-chest, substantially as set forth.

4. A dredger, excavator and elevator comprising a stand-pipe consisting of a head-section, an injector-section and one or more intermediate sections and a waste-chest spaced from the injector-section and having an inwardly-projected nozzle arranged to form an injector with the injector-section of the stand-pipe for drawing in and elevating the material, substantially as set forth.

5. A dredger, excavator and elevator comprising a stand-pipe having an inlet and an outlet for the material, a waste-chest, a diaphragm partition dividing the waste-chest into two chambers, feed-pipes leading to

the two chambers, a nozzle projected outwardly from one chamber and a nozzle projected inwardly from the other chamber, substantially as set forth.

6. A dredger, excavator and elevator comprising a stand-pipe having an open bottom, a waste-chest having oppositely-projected nozzles, means for securing the waste-chest to the bottom of the stand-pipe and spacing it therefrom comprising an annular series of bolts and sleeves located on the bolts and interposed between the chest and the bottom of the stand-pipe, substantially as set forth.

697,705. DAMPER-CONTROLLER. DAVID H. BARNES, Grandford, N. J., assignor to Halsey Nelson, Brooklyn, N. Y. Filed Jan. 18, 1900. Serial No. 88,473. (No model.)

Claim.—1. The combination with a damper-regulator for boiler-furnaces controlled by variations of pressure of the steam in the boiler, through the medium of a damper-motor, actuated by a fluid under pressure to hold the damper open, of the furnace-door and a cut-off and vent device so connected to and operated by the furnace-door as to cut off the controlling fluid medium from the damper-motor and relieve said motor of pressure and so allow the damper to be closed when the furnace-door is opened.

2. A combined steam-pressure and furnace-door-damper controller, consisting of a damper-motor connected to the damper and actuated by a fluid under pressure, a controlling device actuated by changes in the material being heated by the furnace to allow the fluid under pressure to pass to the damper-motor and to vent the same, a reservoir for each fluid under pressure, pipes connecting the source of fluid-supply to the controlling device and the damper-motor, a cut-off and vent valve in the supply-pipe to the damper-motor, and means connecting the cut-off and valve and the furnace-door whereby the fluid is cut off from and the damper-motor vented when the furnace-door is open and when the boiler-pressure is above the normal.

3. A combined steam-boiler pressure and furnace-door-damper controller, comprising a damper-motor, a source of fluid-pressure supply for actuating the damper-motor to hold the damper open, a controlling device, comprising a governor and a relay, said governor being actuated by steam from the boiler to allow the fluid under pressure to actuate the relay to cause it to allow the fluid under pressure to pass to the damper-motor and to allow the fluid to escape from the damper-motor when the pressure of the steam rises, pipes connecting the source of fluid-supply, the controlling device and the damper-motor, a cut-off and vent device located in the supply-pipe to the damper-motor, and a connection between the furnace-door and the cut-off and vent-valve whereby said valve is closed and its vent opened during the initial opening of the door.

4. In a steam-boiler furnace, the combination of the smoke-stack damper, a motor controlling the damper, means for controlling the motor operated by the boiler-pressure and means for controlling the motor operated by the furnace-door to cause the closing of the damper when the steam-pressure rises above a predetermined point or when the furnace-door is opened, and to cause the opening of the damper when the boiler-pressure is normal or less than normal and the furnace-door is closed.

5. In a steam-blower furnace, the combination of the smoke-stack damper, a motor for closing the same when the steam-pressure rises above a predetermined point or when the furnace-door is opened, and for opening the damper when the steam-pressure falls below the predetermined point and the furnace-door is closed, means for controlling said motor actuated by the boiler-pressure, and means for controlling the motor actuated by the furnace-door.

897,706. GUIDE-PLATE FOR CIGAR-WRAPPER-CUTTING MACHINE. HANCOCK DU BOIS, Cincinnati, Ohio. Filed June 4, 1901. Serial No. 68,128. (No model.)

Claim.—1. As a new article of manufacture, a replaceable or interchangeable shaping-guide for that type of cigar-wrapper-cutting machines employing a floating tool; said guide comprising an open frame corresponding to the outline of the wrapper to be cut, formed with a vertically-extending guiding track or flange, integral supporting and attaching arms of different lengths extending rearwardly from one side of the frame so as to leave the front side of the frame free, and connected at their rear ends by a bar so that the major axis of the frame lies at an angle to said bar; said bar being constructed for detachable connection with the machine and designed to be parallel to the front of the machine when so attached.

2. As a new article of manufacture, a shaping-guide for cigar-wrapper-cutting machines, employing a floating tool; the same comprising an open frame constructed of a horizontal base-flange, integral attaching-arms extending outwardly therefrom and in the plane of said base-flange, constructed for replaceable attachment to the machine without disturbing the working parts of the latter, and having a flange conforming to a cigar-wrapper outline projecting vertically from the horizontal base-flange along the edge of the opening, out of the plane of the base-flange and providing a track for engagement with the tool and direction of the latter over the projecting arm.

3. As a new article of manufacture, a replaceable or interchangeable shaping-guide for cigar-wrapper-cutting machines of the type employing a floating tool; the same comprising an open frame formed along the inner edge of the opening with a thin vertical tool-receiving track or flange and around the outer side with an outwardly-extending stiffening base or flange, and arms extending rearwardly from said flange or base on one side only of said frame and provided at their rear ends with means for detachably securing them to the type of machine specified; said arms being connected at their rear ends by a cross-bar which lies parallel to the front of the machine when the guide is connected for use, and the arms being of different lengths whereby they hold the shaping-guide in a position with its major axis at an angle to the front of the machine.

4. A cutter-guide plate for wrapper-cutters, comprising a frame, and means upon opposite faces thereof for guiding a cutting-tool.

5. A cutter-guide plate for wrapper-cutters, comprising a frame, and angularly-disposed tracks upon opposite faces thereof.

6. A cutter-guide plate for wrapper-cutters, comprising a frame, means upon opposite faces thereof for guiding a cutting-tool, and a long and a short supporting-arm.

897,707. STOPPING OR STARTING DEVICE. WILLIAM C. HAYES and WILLIAM A. REED, Boston, Mass., assignors to Flegg Manufacturing Company, Boston, Mass., a Corporation of Maine. Filed Oct. 6, 1901. Serial No. 77,068. (No model.)

Claim.—1. A machine of the character described comprising a rotatable member, driving means for rotating it, an arresting device adapted to stop the rotatable member with a disintegrating resistance at a point slightly beyond a complete rotation and to return it to its starting-point, and means for automatically disconnecting the driving power from the rotatable member.

2. A machine of the character described comprising a rotatable member, driving means for rotating it, said means including a clutch, an arresting device adapted to stop the rotatable member with a disintegrating resistance at a point slightly beyond a complete rotation and to return it to its starting-point, and means for automatically disconnecting the clutch member during the operation of the arresting device.

3. A machine of the character described comprising a rotatable member, driving means for rotating it, said means including a clutch, an arresting device adapted to stop the rotatable member with a disintegrating resistance at a point slightly beyond a complete rotation and to return it to its starting-point, said device having means for varying the rate of disintegration of said resistance, and means for automatically disconnecting the clutch member during the operation of the arresting device.

4. A constantly-actuated driver, a driven member, a clutch to connect and disconnect said driver from the driven member, a trip-lever connected to cut and release the clutch, means acting on the trip-lever to yieldingly arrest the same, a projection on the driven member, a rotary stem carried by the trip-lever and having a member to be engaged by said projection and offset from the axis of rotation of the stem to avoid said projection upon rotation of the stem, a lost-motion connection between the stem and trip-lever, and an operating device connected with the stem.

897,708. LAMP HOOD AND SWITCH. HARRY BERNHARD, Baltimore, Pa. Filed July 26, 1901. Serial No. 68,415. (No model.)

Claim.—1. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm pivoted to oscillate between said contacts, and an arc-lamp supported above and pivoted about the same center whereby the weight thereof operates to move said switch-arm into and retain the same in either of its operative positions when moved past its control or neutral point.

2. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm pivoted to oscillate between said contacts, an arc-lamp supported above and pivoted about the same center whereby the weight thereof operates to move said switch-arm into and retain the same in either of its operative positions when moved past its control or neutral point, and a cushion adapted to take up the shock of said arm when oscillated to its operative position.

3. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm pivoted to oscillate between said contacts and engage at one side before leaving the other, and an arc-lamp supported above and pivoted about the same center whereby the weight thereof operates to move said switch-arm into and retain the same in operative position when moved past its control or neutral point.

4. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm pivoted to oscillate be-

tween said contacts, an oscillable lamp-supporting member operating upon the same center as said arm, and a lamp suspended from said member above its axis which is adapted by its weight to act upon said member when moved past its control or neutral point in either direction to actuate said arm into and retain the same in operative position.

5. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm pivoted to oscillate between said contacts, an oscillable lamp-supporting member operating upon the same center as said arm, a lamp suspended from said member above its axis which is adapted by its weight to act upon said member when moved past its control or neutral point in either direction and actuate said arm into and retain the same in operative position, and means to take up the cushion when said arm is moved into said operative position.

6. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm loosely mounted upon a shaft and adapted to oscillate between said contacts, an oscillable lamp-supporting member carried by said shaft, a lamp suspended from said member above its axis which is adapted by its weight to move said member in either direction when actuated past its control or neutral point, and means whereby said switch-arm remains unactuated until said lamp member has been actuated past its neutral point.

7. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm loosely mounted upon a shaft and adapted to oscillate between said contacts, an oscillable lamp-supporting member carried by said shaft, a lamp suspended from said member above its axis which is adapted by its weight to move said member in either direction when actuated past its control or neutral point and actuate said switch-arm into and retain the same in operative position, means whereby said switch-arm remains unactuated or unremoved until said lamp member has been actuated past its neutral point, and means to take up the cushion of said arm when moved into operative position.

8. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm pivoted to oscillate between said contacts, an arc-lamp pivoted about the same center, whereby the weight thereof operates to move said switch-arm into and retain the same in either of its operative positions when moved past its control or neutral point, and a cushion adapted to take up the shock of said arm when oscillated to its operative position.

9. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm pivoted to oscillate between said contacts, an arc-lamp supported above and pivoted about the same center whereby the weight of said lamp operates to move said switch-arm into and retain the same in either of its operative positions when

moved past its control or neutral point, a cushion adapted to take up the shock of said arm when oscillated to its operative position, and a crank or the equivalent thereof carried by said arc-supporting mechanism to operate the lamp past its neutral point of suspension.

10. In a lamp for use in a lamp, the combination with the necessary contacts, of a switch-arm pivoted to oscillate between said contacts and engage at one side before leaving the other, an arc-lamp supported above and pivoted about the same center, whereby the weight thereof operates to move said switch-arm into and retain the same in operative position when moved past its control or neutral point, and a crank or the equivalent thereof carried by said arc-supporting mechanism to operate the lamp past its neutral point of suspension.

11. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm pivoted to oscillate between said contacts, an oscillable lamp-supporting member operating upon the same center as said arm, a lamp suspended from said member above its axis which is adapted by its weight to act upon said member when moved past its control or neutral point in either direction and actuate said arm into and retain the same in operative position, and a crank or the equivalent thereof carried by said arc-supporting mechanism to operate said member past its neutral point.

12. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm pivoted to oscillate between said contacts, an oscillable lamp-supporting member operating upon the same center as said arm, a lamp suspended from said member above its axis which is adapted by its weight to act upon said member when moved past its control or neutral point in either direction and actuate said arm into and retain the same in operative position, means to take up the cushion of said arm when moved into operative position, and a crank or the equivalent thereof carried by said operating mechanism to operate said member past its neutral point.

13. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm loosely mounted upon a shaft and adapted to oscillate between said contacts, a lamp-supporting member carried by said shaft, a lamp suspended from said member above its axis which is adapted by its weight to move said member in either direction when actuated past its control or neutral point and actuate said switch-arm into and retain the same in operative position, means whereby said arm is unactuated until said lamp member has been actuated past its neutral point, and a crank or the equivalent thereof carried by said shaft to operate said lamp member past its neutral point.

14. In a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm loosely mounted upon a shaft and adapted to oscillate between said contacts, a lamp-supporting member carried by said shaft, a lamp suspended from said member above its axis which is adapted by its weight to move said member in either direction when actuated past its control or neutral point and actuate said arm into and retain the same in operative position, means whereby said arm is unactuated until said lamp member has been actuated past its neutral point, and means to take up the shock when said arm is moved into operative position.

15. A head, a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm loosely mounted upon a shaft and adapted to oscillate between said contacts, a lamp-supporting member carried by said shaft, a lamp suspended from said member above its axis which is adapted by its weight to move said member in either direction when actuated past its control or neutral point and actuate said switch-arm into and retain the same in operative position, means whereby said arm is unactuated until said lamp member has been actuated past its neutral point, and means to take up the shock when said arm is moved into operative position.

16. A head, a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm loosely mounted upon a shaft and adapted to oscillate between said contacts, a lamp-supporting member carried by said shaft, a lamp suspended from said member above its axis which is adapted by its weight to move said member in either direction when actuated past its control or neutral point and actuate said switch-arm into and retain the same in operative position, means whereby said arm is unactuated until said lamp member has been actuated past its neutral point, and means to take up the shock when said arm is moved into operative position.

17. A head, a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm loosely mounted upon a shaft and adapted to oscillate between said contacts, a lamp-supporting member carried by said shaft, a lamp suspended from said member above its axis which is adapted by its weight to move said member in either direction when actuated past its control or neutral point and actuate said switch-arm into and retain the same in operative position, means whereby said arm is unactuated until said lamp member has been actuated past its neutral point, and means to take up the shock when said arm is moved into operative position.

18. A head, a lamp for use in a lamp, the combination with a switch having the necessary contacts, of a switch-arm loosely mounted upon a shaft and adapted to oscillate between said contacts, a lamp-supporting member carried by said shaft, a lamp suspended from said member above its axis which is adapted by its weight to move said member in either direction when actuated past its control or neutral point and actuate said switch-arm into and retain the same in operative position, means whereby said arm is unactuated until said lamp member has been actuated past its neutral point, and means to take up the shock when said arm is moved into operative position.

upon each lead-wire to partly extend and engage in said insulation, a switch inclosed in said head the movable member of which is provided with a crank, a lamp suspended from said crank whereby the gravitating force thereof will co-operate with the force employed to move said switch-member crank divert the current and maintain the continuity of the circuit in said diverted path, means of applying the necessary force to said crank to co-operate with said lamp gravity, and means of reducing tension when the movable contact member is forced to operative position.

19. A head, tubular insulation carried by said head, a helix formed upon each lead-wire which partly extend and engage in said insulation, a switch inclosed in said head the movable member of which is provided with a crank, a lamp suspended from said crank whereby the gravitating force thereof will co-operate with the force employed to move said switch-member crank divert the current and maintain the continuity of the circuit in said diverted path, means whereby disengagement of the switch members is not effected until said lamp-gravitating force becomes active, and means of reducing tension when the movable contact member is forced to operative position.

20. A head, tubular insulation carried by said head, a helix formed upon each lead-wire to partly extend and engage in said insulation, a switch inclosed in said head the movable member of which is provided with a crank, a lamp suspended from said crank whereby the gravitating force thereof will co-operate with the force employed to move said crank divert the current and maintain the continuity of the circuit in said diverted path, means of applying the necessary force to said crank to co-operate with said lamp gravity, means whereby the disengagement of the switch members is not effected until said lamp-gravitating force becomes active, and means of reducing the tension when the movable contact member is forced to operative position.

21. The combination with a lamp and the leads thereof, of a flanged head adapted to inclose the lamp-switch, tubular insulation carried by the flange of said head, and a helix formed upon each of said lead-wires to adjustably engage in said insulation.

22. The combination with a lamp and the leads thereof, of a head adapted to inclose the switch and having an annular inclined flange extending thereabout, tubular insulation secured upon said flange, and a helix formed upon each of said leads to adjustably engage in said insulation.

23. The combination with a lamp and leads thereof, of a head adapted to cover the switch mechanism, tubular insulation carried by said head and helices formed upon said leads circumferentially engaging in said insulation.

24. The combination with a lamp and leads thereof, of a head adapted to inclose and support the switch mechanism, tubular insulation carried thereby, and helices formed upon said leads circumferentially engaging in said insulation.

25. The combination with a lamp and the leads thereof, of a head adapted to cover the switch mechanism and provided with an annular flange, tubular insulation carried thereby beneath said flange, and helices formed upon said leads circumferentially engaging in said insulation.

26. The combination with a lamp and the leads thereof, of a head adapted to inclose and support the switch mechanism and provided with an annular flange, tubular insulation carried thereby beneath said flange, and helices formed upon said leads circumferentially engaging in said insulation.

697,709. TAY BOLT. DAVID L. FINEBERG, THORNTON, N. C. Filed Oct. 12, 1901. Serial No. 73,772. (No model.)

Claim.—In a device of the character described, the combination with a head provided with a house for a small animal, of a tread-drum having an opening in its periphery located adjacent the said house, a hollow extension to the said house and having its outer end adjacent the said drum, said outer end being curved to conform to the curvature of the drum, a propeller-shaft having its inner end adjacent the said drum, and means whereby the said shaft and drum will rotate simultaneously.

697,710. RAG-PANTHER. LAWRENCE C. GERRARD and JAMES M. ROWLEY, Buffalo, N. Y. Filed June 1, 1901. Serial No. 66,778. (No model.)

Claim.—1. In a bag-fastener, the combination of a fixed clamping member, and a movable clamping member adapted to clamp a cord between them, and a cam-lever of which said movable clamping member forms the axis.

2. In a bag-fastener, the combination of a plate, a fixed clamping member carried by said plate, a movable clamping member, and a cam

operated to bear against said plate to operate said movable member to clamp a cord.

3. In a bag-fastener, the combination of a fixed clamping member, a movable clamping member, a cam for operating said movable member to clamp a cord, and means for locking said cam when said movable member is in the clamping position.

4. In a bag-fastener, the combination of a plate, a fixed clamping member carried by said plate, a movable clamping member, and a cam adapted to bear against said plate to operate said movable member to clamp a cord, an operating-arm connected to said cam, said arm and said plate having helms adapted to register with each other in the clamping position of the parts.

5. In a bag-fastener, the combination of a plate having helms at opposite ends for the reception of a cord, means intermediate of the ends for clamping said cord, and an operating-arm K for said clamping means, said plate and arm having helms adapted to register with each other in the clamping position of the parts.

6. In a bag-fastener, the combination of a plate carrying a clamping member, of an arm connected to a second clamping member and adapted to bear upon and extend beyond said plate in the clamping position of the parts.

697,711. SAND-BAW GUINER AND THOMSON DEVER. ARNOLD GILLARDSON, Philadelphia, Pa. Filed June 5, 1901. Serial No. 68,188. (No model.)

Claim.—1. The combination in a hand sawing-machine, of pulleys; a hand-saw supported by the pulleys; guide and tension wheels each composed of a metallic flange and hub, a non-metallic disk and a web covering applied to the periphery of the disk; and adjustable supports for the said wheels.

2. The combination in a hand sawing-machine, of pulleys; a hand-saw; rotary guide and tension wheels, each wheel having a metallic rim and hub, and a non-metallic disk, said hub being provided with double conical bearing-surfaces; and a spindle for each wheel having double conical bearings in the hub and one of said bearings adjustable; the said hub being provided with an open space for the reception of a lubricant.

3. In a hand sawing-machine, rotary guide and tension wheels having a metallic hub, back and narrow rim, a pulley formed by the parts above said, and therein inserted and held, a non-metallic block having properties to retain cement or other adhesive substance.

4. In a hand sawing-machine, metallic guide and tension wheels having a non-metallic body secured thereto, and covered with leather or like material upon the parts of the wheels in contact with the saw rim, and a metallic edge raised around one edge of the cover above said which the saw's back edge may rest when resisting pressure against its cutting edge or teeth.

5. The combination in a hand sawing-machine, of pulleys; a hand-saw supported by the pulleys; guide and tension wheels located above and below the table; and means for adjusting each wheel in two directions in a horizontal plane; each of the adjusting means comprising an arm with a groove 10, a bearing 12 with a tongue 11, and a bolt 14, for adjusting the wheel relative to the back edge of the saw; and a box 15 with a groove 16 fitting a tongue on bearing 12 and clamping-bolts, for adjusting the wheel relative to the flat side of the saw; said box 15 supporting a spindle with a free end upon which is located the guiding-wheel.

697,712. FAIRBANKS-WHEEL. JOHN GARDNER, Galveston, Tex. Filed Jan. 24, 1902. Serial No. 61,693. (No model.)

Claim.—1. In a wheel of the character described, the combination with a paddle-wheel loosely mounted upon a shaft, of an inner paddle-wheel rigidly keyed to a shaft and mounted within and concentrically to the first-named paddle-wheel, whereby the paddles of the respective wheels intermesh.

2. In a wheel of the character described, the combination with a support of a paddle-wheel mounted upon said support and adapted to freely revolve thereon, of a shaft journaled in said support and a paddle-wheel journaled in said support concentrically to said paddle-wheel and a paddle-wheel rigidly keyed to said shaft within said wheel whereby the said paddle-wheels intermesh and their combined power is concentrated in the said shaft.

3. In a wheel of the character described, the combination with suitable supports, short shafts having circular enlargements secured to said supports and a paddle-wheel mounted to freely revolve upon said enlargements, of a shaft journaled in said enlargements concentric to the paddle-wheel, a drum keyed to said shaft within said paddle-wheel, inverted-V-shaped brackets secured to the periphery of said drum and adapted to intermesh with the paddles of said paddle-wheel, whereby the combined power of the two wheels is concentrated, and means for transmitting said power.

697,713. LOON-HUTTLE. ORRIN GILMAN, Putnam, Conn., assignor to Bunker Company, Hopedale, Mass., a Corporation of Maine. Filed Nov. 9, 1901. Serial No. 61,691. (No model.)

Claim.—1. A shuttle-body having an opening to receive a filling-carrier, holding-jaws for and to yieldingly engage opposite sides of the head of the filling-carrier, and located at one end of said opening, and resilient means mounted on the shuttle-body to engage and steady the head of the filling-carrier held by the jaws, the latter holding the filling-carrier wholly independently of said means.

2. A shuttle-body having an opening to receive a filling-carrier, laterally-separable holding-jaws for the latter at one end of said opening, and a resilient finger mounted on the shuttle-body above and between said jaws and extending toward the opposite end of the shuttle-body to enter and interiorly engage the tubular head of a filling-carrier when the latter is inserted between and held by the jaws, to steady the filling-carrier and maintain it in operative position.

the said jaws, and connecting with the head of the filling-carrier at a point intermediate the engaging points of the jaws.

3. A self-threading shuttle-body having an opening to receive a filling-carrier, holding-jaws in said opening, an inclined guide in the rear of the cutting flange and between said jaws, and a resilient finger longitudinally extended above the guide and forwardly to engage and steady the head of a filling-carrier held by the jaws.

4. A self-threading shuttle-body having an opening to receive a filling-carrier, holding-jaws, an inclined, slotted guide in the rear of the cutting flange and between said jaws, and a resilient finger longitudinally extended through the slotted guide, to engage and steady the head of a filling-carrier held by the jaws.

5. A shuttle-body having an opening to receive a filling-carrier, holding-jaws in said opening at one end thereof, a filling-carrier having a tubular head provided with annular projections to be engaged by said jaws, and a resilient, longitudinally-extended finger on the shuttle-body, to enter the tubular head of the filling-carrier and engage and steady the same when supported by the holding-jaws.
